"SPECIAL"

"OFFSET"

"ROUND"

The justly **CELEBRATED 8-Day, High-Grade**

"CHELSEA" AUTO CLOCK

(Trade Mark)

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly water-proof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock when removed from outer (locked) case is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the AUTO Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3 1-2 MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

PRICE LIST

	Size	"Round"	"Offset"	"Special"	"Limousine"
"Chelsea"	2 3-4-inch Auto Clock	$26.00	$28.00	$36.00	$28.50
	3 1-2-inch Auto Clock	28.00	30.00	45.00	Only made in 2 3-4-inch
	3 1-2-inch Motor Clock	24.00	26.00	41.00	size in Limousine style.

YOU want the BEST? **CHELSEA CLOCK CO., 16 State St., BOSTON, U.S.A.** Ask for the "CHELSEA"

Largest makers in America of exclusively 8-Day—High-Grade Clocks—Mantel, Marine, Office, Ship's Bell Clocks, Auto Clocks, etc.

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dash-boards. Only made in 2 3-4-inch size.

VOL. XX NEW YORK—THURSDAY, JANUARY 7, 1909—CHICAGO NO. 1

THE AUTOMOBILE

PALACE EXHIBITION SUPPLIES EVIDENCE IN PLENTY

IT is a great automobile show that to-night closes in the Grand Central Palace, where it has continued for the past week most succcssfully under the management of the American Motor Car Manufacturers' Association, with the Motor & Accessory Manufacturers occupying innumerable spaces and the members of the Importers' Automobile Salon contributing the international feature of the exhibition.

In a building which is not suited to the needs of an automobile show, the handicaps of the Palace have been adequately overcome, due to the energy of a competent show committee guided by the managing hand of an energetic director in the person of one Alfred Reeves, who steps into the limelight as an exhibition manager second to none.

Furthermore, it is apparent that people nowadays attend automobile shows because they are interested in automobiles and not through any sentimental regard for any club or organization of which they may be members. 'Tis now a business proposition pure and simple, and the man who goes to look at the cars does so because the cars are there and he wants to see them. At the same time all credit is due to an organization like the Automobile Club of America for its pioneer endeavors in the show line and other fields of activity. Its care of the "infant industry" was timely and deserving of the results obtained, but this prodigy quickly learned to work and soon emerged from its swaddling clothes. Now it's capable and desirous of running its own race, and that's what it is doing, and the evidence of it is supplied in the huge success of the Palace exhibition.

Of course, "Society" does attend automobile shows as before, but the greater number of automobile buyers now come from the middle classes who utilize automobiles from the standpoints of necessity and pleasure, for it is a pleasurable necessity that the average man of some means does not care to do without in these quick-moving days. Quick individual transport was something that mankind had needed for many a day, and the automobile naturally came into its own as soon as it demonstrated reliability and flexibility with economical habits, which were not, unfortunately, apparent in the beginning.

The amount of education supplied by an automobile exhibition, especially in the metropolis of a country, should be commensurate with the undoubted heavy expense for several years to come, even though the Frenchman, who once occupied the center of the stage, wants to discontinue his elaborate show function—providing the Britisher, who is doing quite well, thank you, agrees to follow suit, which he won't do so long as he is ahead in the homestretch. There is such a thing as false economy and

Looking Down the Main Aisle of the Central Exhibition Hall.

giving the public an erroneous idea, which might be detrimental to the continued and increased prosperity of the industry. Added to the desire to discontinue shows, or make them every other year, the Frenchman has decided upon the conclusion of high speed racing, in which direction the American has been an eleventh hour preparer, with the inevitable consequences of defeat when pitted against a rival that was invariably at the starting line long before the firing of the gun.

American progressiveness is the keynote of the Palace show, and even though compared with the best of the foreign makers, the home product holds its own and bids for patronage without any request of special favor for lesser price.

The attendance at the Palace, according to carefully prepared figures by the management, would make it certain that it will close with the best record of any previous American exhibition, and this means that thousands of people have carefully inspected automobiles for the first time, and many of them either have or will own motor-driven vehicles in the near future.

It would appear that the show is still an excellent asset for the industry in this country, for the interest of the public is always a good thermometer by which to reckon. For instance, Monday the figures showed over 15,000 attendance. Tuesday was "Society Day," but, unfortunately, the rain came down more or less in torrents the greater part of the afternoon and evening. 'Tis doubtful if "Society" will have any more special days at Palace shows, possibly because they object to being placed on parade, as it were, though 'tis suspected that there are those who enjoy this to the fullest extent. For the seven days some 75,000 must have paid their way into the Palace.

It is always a question strewed with difficulty to attempt a forecast of the actual returns in immediate dollars due to an exhibition of automobiles and accessories. On the other hand, mere curiosity would not coax an audience to any such place on an amusement basis, day after day. The Palace has been attended by prosperous looking autoists to an extent which makes for great discomfiture nearly all the time, from the opening of the doors to the closing at night, day after day; they talk automobile, discuss the points of merit, and act as if they appreciate the situation in all its phases.

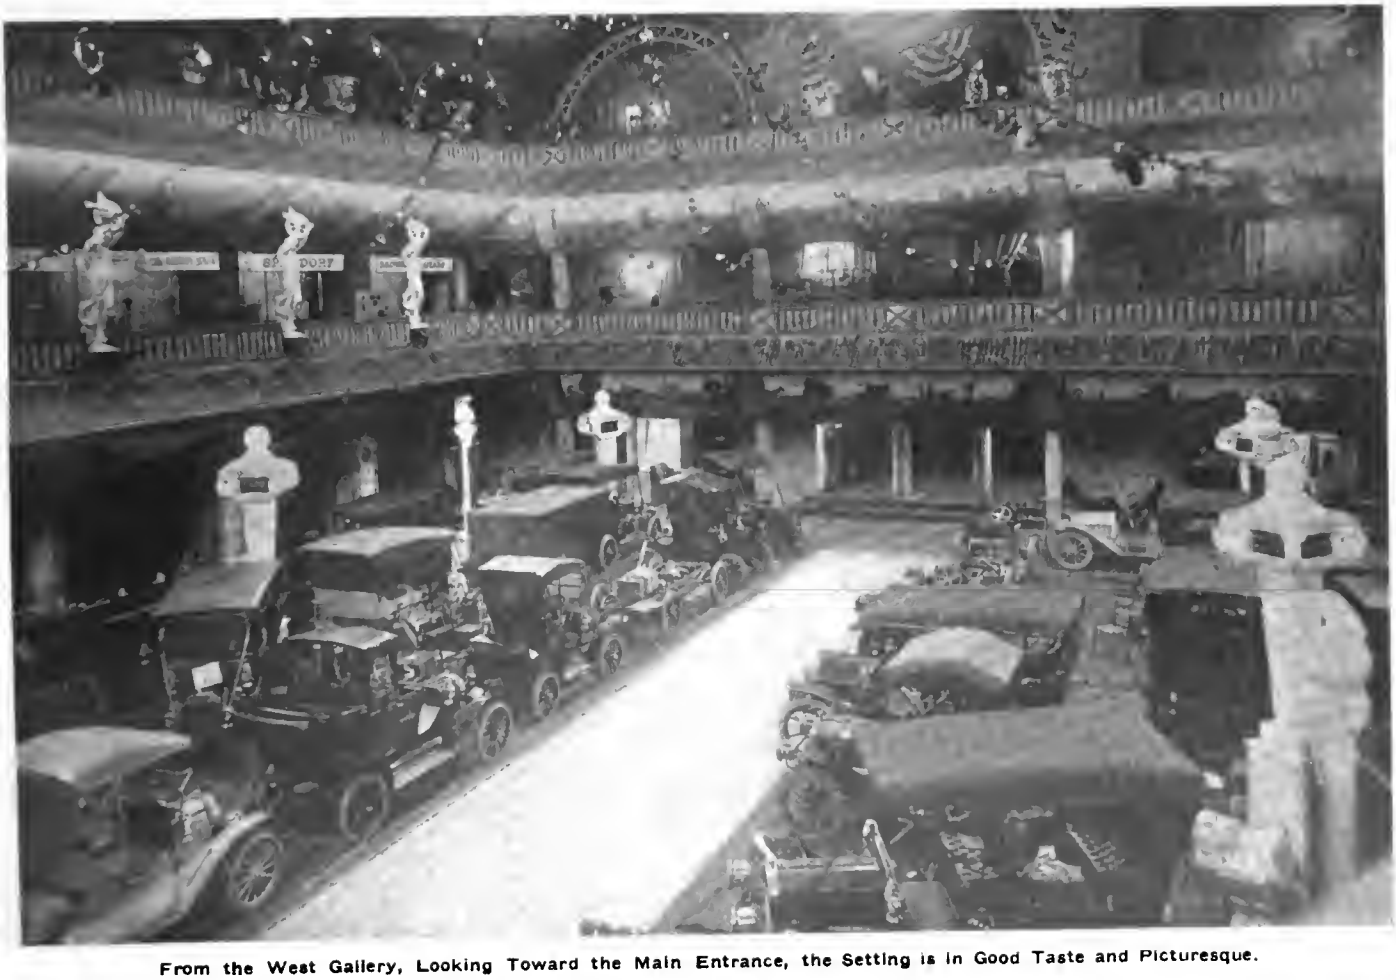
In the meantime there is no doubt of the fact that methods are undergoing change on a basis that can be regarded as even fundamental. Take for illustration the question of accessories: the exhibition is largely one of the makers of these necessities, and that they are doing more of a wholesale business at the show than was the case formerly is assured. On the other hand, it is not assured that the retail business at the show is increasing at the same rate. There is nothing in this to be commented upon, unless favorably, since if the makers of accessories can bring their samples to some center mart of trade, and there meet all their customers, the end will be a reduction in the cost of disposing of goods, which as a rule foots up to a pretty penny.

Should the retailer ultimately find it unprofitable to go to the show with his wares, he will be benefited to the extent that customers will come to his place of business and save him the cost of the especial display. In this way, customers will be able to look at the samples at the exhibition, and get a line upon the improvements wrought; the retailer will have the advantage of being able to select from the several available sources the goods that, in his judgment, will find a ready market. Besides, it will be more easy to determine the likes and avoid the dislikes of the ultimate buyers.

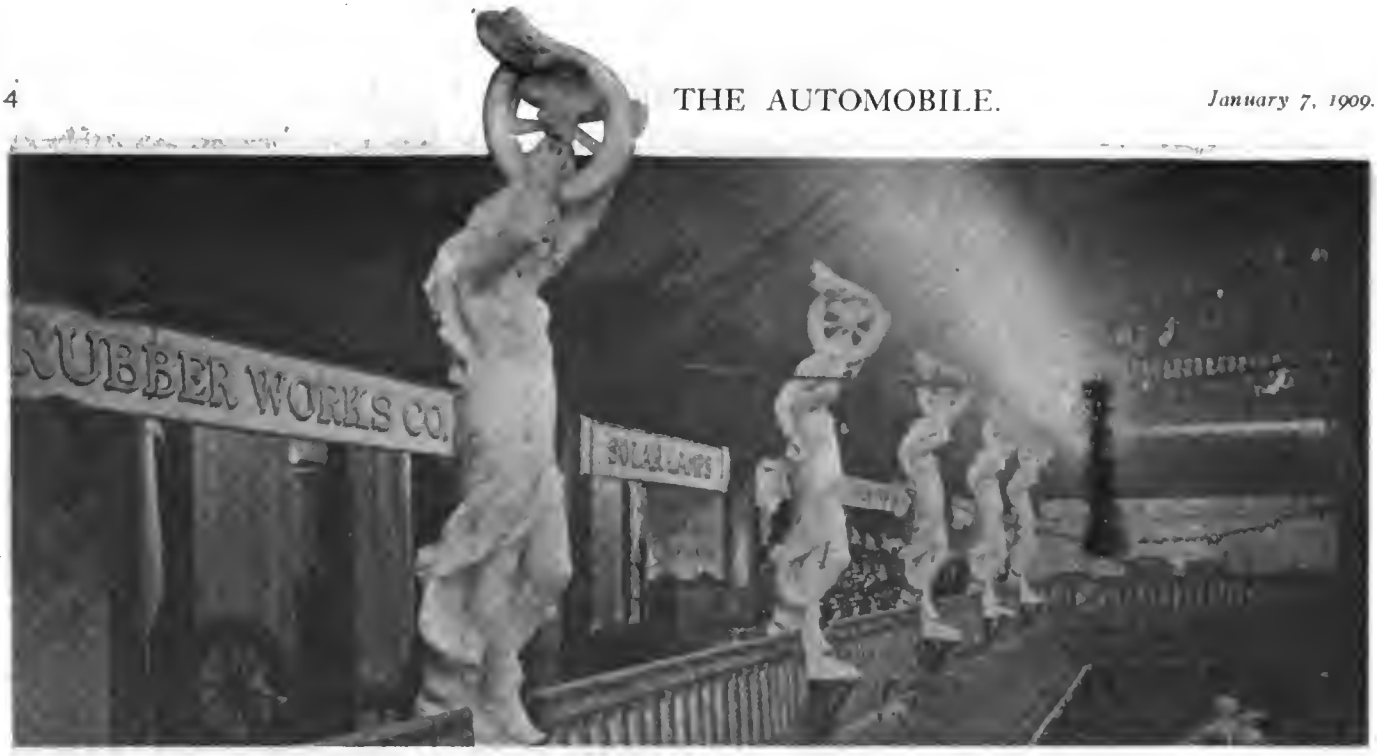
The medium-priced automobiles, judging from show indications, are finding ready buyers on an extended scale, and this is a sign that means far more than the mere statement implies. In ordinary times it is a well-known fact that the prospectives go to the show to look. They decide on the circle of cars that they will give more detailed attention later on. The actual placing of orders is a matter that they extend into the future, and the exhibitors formerly regarded this state of affairs as equal to orders.

This year's automobiles were heralded as of great money value, months before the show opened, and in some measure sales were depressed in consequence; autoists having decided to await the show and take their pick of the best the market affords. They are now taking their pick, and the volume of trade is large, with perceptible haste in the buying, due in no small measure to the fact that there is a threatened famine of automobiles of the class in greatest demand.

Looking Northwest from the East Gallery, Where the General View)of Exhibits Can Be Seen to Fine Advantage.



From the West Gallery, Looking Toward the Main Entrance, the Setting is in Good Taste and Picturesque.



Of the higher priced cars there is less of uncertainty than formerly, due to the lack of any great influence on the situation at the behest of the makers of foreign automobiles. The foreign makers can scarcely create a ripple on what seems to be a very placid situation.

There are examples of the best types of American cars at the show that "shine" alongside of any product from any land, and it is fortunate for the industry that the buyers of this class of cars know it. This situation is not actually new, but the patrons of the industry were a little slow in their appreciation of the fact. In other words, last year's cars were every whit as good as any product in all ways. This year the situation is even better in view of the fact that the American cars are with superior materials and it is not at all certain that the "foreigners" can hold to quality and lower the price as well. One thing is dead sure, they are not here for their health, and they will not hand out two dollars of material for less than two dollars.

The old skepticism is below the surface, if it exists at all. Dealing is on a far more pleasant basis, and the public is not so hungry for "ghost stories." Formerly it was claimed that to sell a car it was necessary to "invent" improvements, and some went so far as to talk about things that did not exist excepting in the imagination of the salesman (?). In a word, the public has improved in its understanding of what an automobile really is and do not ask questions to which there is no answer. The makers of cars have taken cognizance of the better tone, and they are probably glad that the old "stringing" game is gone. To entirely eliminate this sad state of affairs, it has been necessary to provide salesmen of integrity, rather than "drummers."

Of the visitors at the show it would be impossible to state just how many carriage makers mingle with the rest. It is assured, however, that they are there in "droves." That many of them propose to "slide" into the automobile business is now assured, and it is up to them to settle upon the phase of the situation most likely to gibe with their facilities, assuming there is a market for the product. The buggy type of automobile is, to them, a great attraction, and they are endeavoring to ascertain the attitude of the public.

Of course, New York is not the greatest center of the users of buggy types of cars, but it is a fact, even so, that the demand for the buggy type is brisk, and the buyers come from Pennsylvania, "up state," and all the way from Portland, Me., and to the North. Last year, when sales were as scarce as "chicken's teeth," makers of buggy types of automobiles sold out at the New York show. This was one of the surprises of the year, and it is in a fair way to repeat. It is not to be wondered at then, if the carriage makers come to the Palace to feel the pulse of the public.

THE AUTOMOBILE CALENDAR.

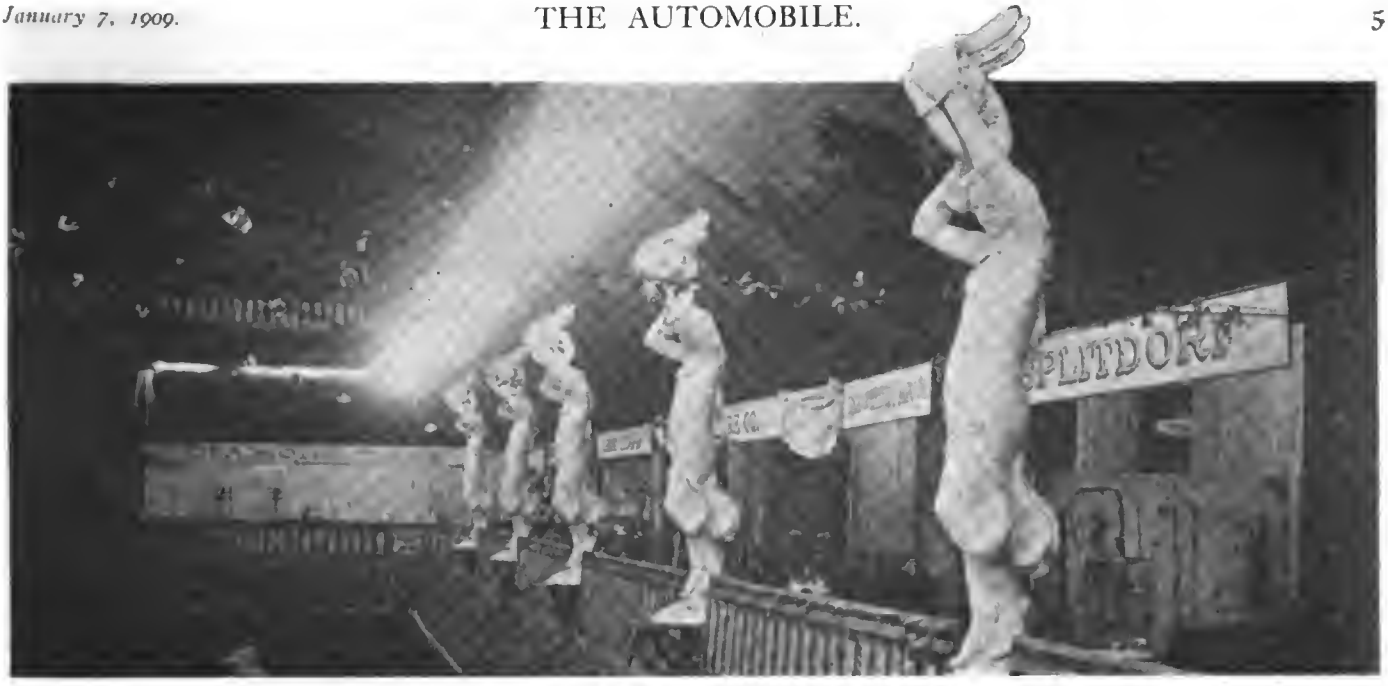
Feb. 24-27.....Omaha, Fourth Annual Automobile Show, Omaha. Automobile Show Association, C. N. Powell, Secretary.

Mar. 1-6.....Buffalo, Convention Hall, Annual Show, Automobile Club of Buffalo. D. H. Lewis, Secretary.

Mar. 6-13.....Boston, Mechanics Building, Seventh Annual Automobile Show, Boston Automobile Dealers' Association. C. I. Campbell, Manager, 5 Park Square.

Mar. 8-13.....Kansas City, Kansas City Automobile Dealers' Association Show.

Mar. 27-Apr. 3..Pittsburg, Duquesne Garden, Automobile Show. Pittsburg Automobile Dealers' Association.



LEVEL ON WHICH MERIT STANDS IS CONGESTED

By THOS. J. FAY.

FIRST approximations always have to be reviewed if it is desired to get at the bare facts; nor does it matter what the problem is when it comes down to a cold and critical review. The earlier review of the automobiles at the show was naturally the immature reflections which indicated what might well be termed "a lick and a promise," excepting that the tabulations were made with care, using the best information possible to procure.

The fear was that the first approximation, so called, might hold in its makeup that class of fallacies which generally does follow when one is a little charitable. As it is, in the light of further knowledge, gained by a close examination of the cars at the show, proof of a lack of sufficient knowledge of the real advance looms up like ghosts that do beset a stricken conscience. If it is not too late to revise the first impressions, in some particulars at any rate, it will be to do scant justice to the situation.

In former shows it was generally the case that here and there a fine example of the best types of cars could be seen if one were practiced in the art of "shopping"; a practice which is said to make one proficient when it comes to wading through a vast assemblage. On this occasion instead of the isolated cases of fine cars, it is to note but few of the class to be styled "below standard." But some joker stole the old standard, and in the replacing of it a better one was substituted; so much better, in fact, that the wonder is that any of the cars came quite up to it. In any attempt, then, to classify any of the cars as "below standard," it must be in the light of the fact that the standard was reconstructed on a basis which is a stranger to the autoist of a year ago.

Thus, to proceed and not to amplify the statements in a manner sufficient to exclude extravagance would be a waste of time. If the automobiles at the show are so much better than they were last year, in what way, how? It will not be possible to take each automobile at the show and tell of the ways in which each car stands out.

Materials as they are used in automobiles are from certain sources, and the first question is, are the materials to be had better than they were? If it can be shown that the materials are superior, then it will be possible to consider that the cars may reflect this condition.

Even if the materials have moved up it will be possible to have variations in design, and then it will be possible to consider that some of the designs may not be so good as the others on the ground that all the designers are not of the same competence. Let us take a second look at this phase of the situation and see if it, too, has not a loophole in it. The lowest priced cars at the show are the ones that might be regarded as likely to hold undesirable features in their makeup. This is a fair assumption. But is it borne out by the facts? If the low-priced cars take advantage of the facilities of the "parts makers," of which there are several who have made a name in the trade, how can the cars be any worse than the parts of which they are composed? Is it not merely a case of the low price because the parts are turned out in vast quantities by men who have all kinds of experience in the respective lines which go to make the cars when the parts are assembled?

Let it not be supposed that the writer is advocating either low-priced cars or parts makers. The cars are at the show and the idea is to tell about them as they are. To sing a song of quality and not show the way in which it can be arrived at is to go it blind. The point to be made is this: The finest cars at the show are so self-evidently fine that the mere statement of fact is all that is necessary. The cars that do not show on the surface the qualities which reside in them are the cars, then, that must be laid bare to the eyes which will have to pay the bill in the long run.

Any purchaser of sense enough to roll off a log can tell at a glance the cars which are being carried along in the vortex of a great industry, and it will be impossible to discover any reason why a review of the industry should specifically pick out "black sheep," if such there are. On the other hand, it is far from right to assume that a car will always be faulty merely because on some occasion the designer made a slip. The sum and substance of the whole thing must be along lines taking into account the general trend. Is the general trend on the same level as last year, or did the art keep pace with time?

This is the question which has to be answered, rather than to say that every detail of every car in the show is up to a standard such as would please some overfastidious individual. And, again, the point of view must be taken into account. It would be perfectly foolish to assume, even for a moment, that a buggy type of automobile can serve as the equivalent of a standard touring car. On the other hand, the touring car cannot do the work that might be fairly expected of a buggy type. By this

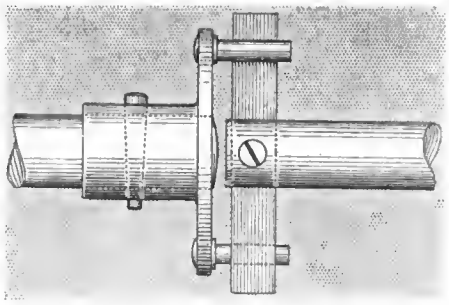


Fig. 1—A modern universal joint for pumps.

process of reasoning it is fair to conclude that the cars at the show have their respective tasks to perform, and the only question is, how well will they do it?

Every purchaser must decide for himself the kind of a car he may want, in view of the work to be done, and purchasers can be mistaken about it. A mistake in the selection of a car for a given task would in no way affect the quality of the car, although it might add evidence by way of indicating more conclusively the fact that the car as selected would render more satisfactory service in some other zone of activity. In other words, the quality of a car will be, (a) in the abstract, (b) for a given task to be performed. If a purchaser buys a car for a given purpose, and the car is not suited to the work, it is the purchaser's mistake and he will have to be content to charge the expense to profit and loss, mostly loss, and he will be in great good luck if it does not prove to be a dead loss.

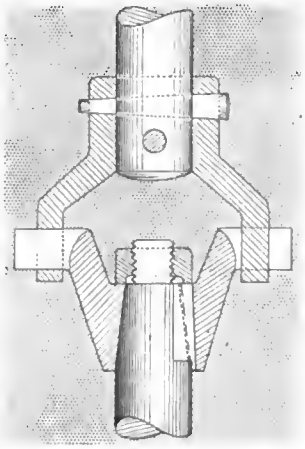

Fig. 2—Rather formidable magneto drive.

It seems to be necessary to thus explain the influence of selection upon the question in order not to give the impression that this review is not by way of kind words. Of course, there is nothing in being too critical, especially since there is ample room for an honest difference of opinion in not a few cases. With this understanding it will be possible to put proper weight on the statements and inferences with small chance of going wrong in the main.

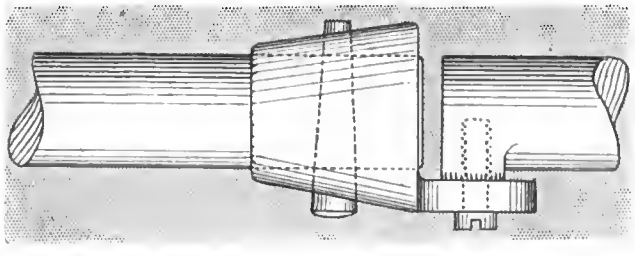

Fig. 3—Exit. A typical flimsy scheme of the past.

All along the line the question is one in which it is almost impossible for a man to actually procure distinctly inferior products, simply because the standard has moved up, and the inferior materials would have to be obtained as "special" at a higher price. That there is plenty of room for improvement is a settled matter, but that the cars are abreast of the times is equally assured. If the Chinese invented the telephone five centuries ago, they were too early, since it was not possible to put them to commercial use until the world moved up to a "hot-foot" pace. In the same way it will be proper to await the time when the world will stand for more improvements in the automobile than are now in evidence.

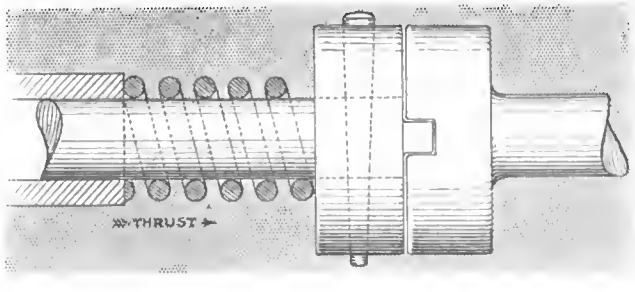

Fig. 4—It is no longer to be recommended.

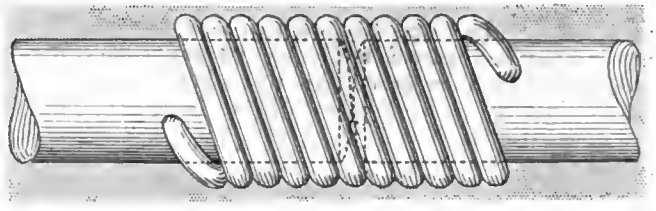

Fig. 5—An early makeshift that finds few advocates.

As respects design features, there are a few things to say which will clear the atmosphere a little, and for the purpose of rendering the text a little more clear, it is proposed to illustrate the points. Fig. 1 shows a universal "safety" joint such as is used on cars of the superior design not to the exclusion of other and equally good methods. As will be observed, this joint is so made that if a pump is "froze up," the flat spring will snap around and the operator will be warned. The shaft will not be twisted off, because the spring is weaker than the shaft.

From this to Fig 2 is a long way in the wrong direction, and the designer who substituted a casting for the spring must have had water on the brain. This would not be so much of a crime were it not for the fact that the method was reported in a "technical paper" as one of the approved methods to use in automobile work.

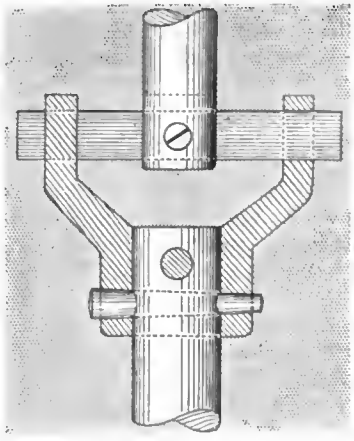

Fig. 6—Safety water pump drive.

In the same paper the scheme Fig. 3 was offered as a means to be employed. The screw used to connect the two members might stay in place long enough to go a couple of hundred miles, but it would surely be the first thing in the car to fail. The first thing that is likely to fail in a car is the first thing to eliminate, and, while the matter is up, it may as well be said that the item in the makeup of a car that will last the longest is a little too good for the place if the quality that goes to make it everlasting is at any extra cost.

Fig. 4 is another idea that does not seem to be in the cars at the show, although it is recommended by some of the sharps of the technical press. In this cut it will be noticed that one of the enlargements is held in place with a taper pin and the other is integral. Surely this is not on the road to harmony in design that looks and is so good.

Fig. 5 is a makeshift, which is only recommended by the paper sharps; it can scarcely find many advocates on the ground that sooner or later the spring will be cut through by the sharp edges at the ends of the shafts; anyway, it is nothing to pay money for.

Fig. 6 is a very bad imitation of the device as illustrated in Fig. 1, and it is just as well to say many of the better designs have from time to time been badly copied, but it is fair to relate that the cars of the year are more nearly free of such things than they were in former years.

Fig. 7 is another variation of Fig. 4: but it is better, since there is no spring to cause thrust. Why one of the enlargements

should be integral is a matter which can only be explained on the ground that the assembling demanded it.

Right here it will be opportune to say that the cars of the year are singularly free from the incongruous details that made some of the earlier products the laughing stock of mechanics. It was natural to expect that "inventors" would leave their mark on the cars and that the mark itself would be by way of ideas, however good, in settings that mechanical engineers less prolific in ideas, but more skilled, would have to erase or revise.

There has been a goodly lot of this erasing, and of revising, so much so that any attempt at reiteration would be an impossible task. The old bicycle days are gone, the impossibles of the taper pin are too well known to be imposed upon buyers of cars, and good, sound mechanical work is having its day. Weight is eliminated in so far as this phenomenon is a detriment, and it is now known that a certain amount of weight is as necessary as the gasoline or the crankshaft. Of course it is possible to foresee a day when the gasoline will give out, and that the crankshaft will be eliminated in time—maybe a long time—to make way for the "gas turbine." When the day of no gasoline arrives it is certain that something better will be at hand to take its place. As to the turbine, it is of the future, with no chance of influencing the automobiles as they obtain at the present time.

There is one more point that is good to relate, i.e., while the body work of the present is high in the scale of quality, it is a fact that fine body work does not now throw dust in the eyes of buyers, as was the case in the early days. When some of the cars could not be sold because they did not grow a reputation on the merit of the chassis, it was formerly easy enough to hide the machinery under a fine body and sell the whole. As it is, while the patrons want good bodies, they also want good machinery. Fortunately, the makers of cars arrived at the same conclusion at about the same time, and it is a happy state of affairs that enables the patrons to find what they want at the show at the price which fits their inclination, assuming that necessity is not at the bottom of the wish. The fact remains that scant pocketbooks can do very well, especially now that the cost of keeping a car is within the bounds of reason.

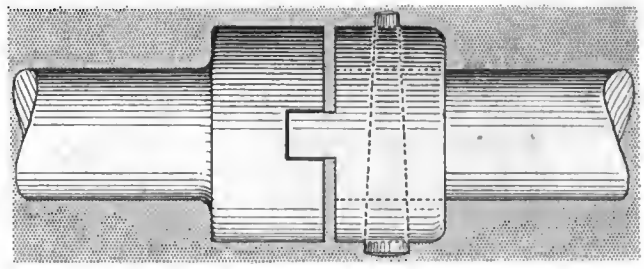

Fig. 7—One of the early types of joint.

If the discussion thus far will serve to indicate more nearly why the claim of superiority is not merely extravagant, it will be possible to mention such of the cars at the show as will fall within the deadline, in so far as the author has been able to give the details of the cars a fair measure of attention in the limited time at his disposal.

SALIENT FEATURES OF THE AMERICAN MAKES

AMERICAN: American Motor Car Company, Indianapolis.—The underslung frame chassis of the American has always made it a car to be known even at a great distance away. The wheels are of greater diameter than is the usual custom, and the car looks long and low, thus giving the appearance of speed, which is also a phenomenon in cars of this make. The "Traveler" type of the American with 40-inch wheels is one of the most distinctive looking cars built, and this line is drawing the sight-seers at the show. The "Traveler" type is equipped with a 50-60-horsepower four-cylinder water-cooled motor, with cylinders 5 3-8 x 5 1-2 inches bore and stroke respectively, and the ignition is by "Bosch" magneto. The wheelbase is 122 inches, and the shaft drive is to a "floating" live rear axle of the best construction. In general the American cars bare the earmarks of the designer with a sharp pencil and a "think-tank" full of good ideas.

AMERICAN-SIMPLEX: Simplex Motor Car Company, Mishawaka, Ind.—This company has made a good success of the two-cycle proposition, and the cars in use are regarded as up to a fitting standard. The 50-horsepower four-cylinder motor of the line with 5 x 5 cylinders is well liked by those who have given it a trial, and that the power is there is assured. Probably the one feature that will be of the greatest interest is that the flexibility of the motor is remarkable. This fact is worth bringing out because it is not uncommon to hear the four-cycle sharps make the claim that the two-cycle motor lacks in this essential particular. They know all about four-cycle work, and have no time to look into the virtues of the two-cycle motor. Of course, it is a good idea to be proficient in one language, so to speak. The fact does not debar the other methods. As Schley said: "There is glory enough for all."

AUSTIN: Austin Automobile Company, Grand Rapids, Mich.—This company turns out a 45-horsepower car as a runabout, the price of which is $2,850, and the motor is a vertical six-cylinder, 4 1-2 inches square, with magneto and auxiliary coil and all the accessories which go to make a power plant complete. With a multiple disc clutch, a three-speed selective transmission gearset, and shaft drive, the car takes on

The Atlas Line Looked Substantial and Staple.

A New One Made in New York City—The Benner.

Brush Runabout, that Climbed Pike's Peak, in Foreground.

the characteristics of a splendid proposition and serves as an index to the Austin line of cars the like of which is worth going to the show to look upon, even assuming that the reasonable price asked is in excess of the surplus available in any given case. Of course this car as a runabout is intended as a vehicle to take no man's dust.

A Little but Active Auto for the Young Generation.

ACME: Acme Motor Car Company, Reading, Pa.—The Acme line is most complete, and a motorist who can not find among the Acme cars one to suit is rather overdoing it. The Acme "thirty" with a four-cylinder motor, cylinders 4 5-8 x 5 inches bore and stroke respectively, is conservatively rated, and in all respects it looks like a car for the man that cannot afford to buy one every year or two.

The Array of Powerful Chadwicks Was Imposing.

ALLEN-KINGSTON: Allen-Kingston Motor Car Company, Kingston, N. Y.—While this company makes two models—one of which is a 17-horsepower touring car and the other of much higher power—48-horsepower—the idea will be to concentrate the present discussion on the 17-horsepower car, which belongs to the more recent types involving "en bloc" cylinders, and it is worthy of note that in the cars of this company's make, "New Departure," two-in-one ball bearings are used, almost to the entire exclusion of plain bearings.

BRUSH: Brush Runabout Company, Detroit.—The model B with a 7-horsepower motor and a runabout body is sold at the low price of $550, and in the home town (Detroit) there are a large number of these little cars treading their way around in a manner that lends them an air of utility which is rendered most apparent by beholding them. It is claimed that "no man is a prophet at home." This is a way of saying that the folks at home know just how much stock to take in any given proposition. It looks as if the "Brush" is pretty well liked at home, and it is a good sign. As well as the runabout the Brush delivery wagon is taking among merchants of business acumen.

CAMERON: Cameron Car Company, Beverly, Mass.—As the song went, "the Camerons are coming," etc. The song is out of date; the Camerons are here, and air-cooled at that. The four-cylinder runabout sells at $900, with 3 7-8 by 3 1-2-inch cylinders' bore and stroke respectively. The car is one to attract more than passing notice especially among the friends of the air-cooled proposition, which for that matter is now in a fair way to come into its very own. The motor is equipped with a Remy magneto, and on the whole a healthy ignition system which is half the battle in any automobile. The cone type of clutch is big enough to do the work, and a selective three-speed transmission intervenes a shaft drive. The wheelbase is 96 inches, which is a fine length for a car of the class, and the wheels are fitted with 30 x 3-inch tires, in which is seen a desire to meet the tire situation in a fair manner. There are other Camerons, and the intending purchaser can find the data in "The Automobile."

COATES-GOSHEN: Coates-Goshen Company, Goshen, N. Y.—This company comes to the show for the first time with two chassis models—a 25-horsepower and a 32-horsepower—in which are incorporated a number of special features. The torsion member is a tube which parallels the propeller shaft and is fastened to it at the forward end by a collar. The housing tube terminates in a hollow ball joint within which the double universal centers, thus pivoting the propeller shaft and the torsion tube on a common center. The extensive use of ball and socket joints, ball bearings in transmission, straight-line drive, positive gasoline feed, and standard construction in motor and transmission, all go to complete a design which will attract attention. The cars present a good appearance and the body work is of the most recent class, both in point of design and finish. Beneath the surface, the body work is well executed, and time should not tell so seriously against it.

CHADWICK: Chadwick Engineering Works, Pottstown, Pa.—It was in the Chadwick that one of the important "foreign" companies found the "double bevel gear" that led to the adoption of the "direct on high" idea now so much in vogue. This incident is mentioned to bring out the fact that it is not, as some suppose, a case of going abroad to get ideas. As a matter of fact, the Chadwick set of brains was on the job on that occasion, and even a passing examination of this company's cars will disclose a baker's dozen of nuggets that would adorn any foreign make of car. The Chadwick has never resorted to "house top" methods of crying their wares; indeed, a look at the cars is enough to convince anyone that the company has been in the automobile business for some years.

In the car at the show the Chadwick Company offers to autoists a number of improvements for the first time, improvements that should go a long way towards advancing the automobile as a whole. Take, for illustration, the scheme by means of which the magneto armature is "twirled" in order that the magneto will

"spark" when it is desired to start the motor. With the magneto fitted out in the manner used by the Chadwick it is certainly possible to do with a magneto all that can be done with a coil and a battery during cranking. The Chadwick clutch is by way of an expanding band, the mechanism of which is very ingenious, in which a rack and pinion do the work, and do it well.

The transmission is semi-progressive, which is intended to give all the advantages of both the selective and the progressive systems, eliminating all chance of mistake on the one hand and reducing space and weight on the other. The side chains are in boots and the differential brakes look like practice boiled down. The cardan shaft is terminated in flexible ball joints, which have the facility of affording the requisite flexibility, and at the same time it is possible to disassemble the whole in the shortest time without moving the motor or the gearset. The chassis frame is reinforced at the narrowing point back of the motor and is made of chrome nickel steel. The crankshaft and the gears are also of this same material; indeed, the Chadwick situation throughout is on a basis using the finest materials for the purpose.

CARTERCAR: Motorcar Company, Pontiac, Mich.—The 18-20-horsepower runabout of this make is one to attract more than a little attention, the price of which is $1,000, and in many respects the car is a revelation.

CRAWFORD: Crawford Automobile Company, Hagerstown, Md.—Hagerstown was always more or less addicted to the habit of supporting an industrial contingent, and it is even fair to say that this habit is stronger in Hagerstown than in most of the centers on the border of or below Mason and Dixon line. The Crawford seems to be a good representative of what can be done down there.

DE LUXE: De Luxe Motor Car Company, Detroit.—A $5,000 automobile, and, as the name implies, it is in the class of the highest type of designed automobiles. Nor is the company content to be merely in the class. As a matter of fact, it is a case of design all over, using modern methods, inventing when methods of quality are not to be had, while the materials used are the best that money can buy, with a fine sense of discrimination when it comes to the placing of the materials. The 50-60-horsepower De Luxe model is a car such as will attract notice in any company.

FORD: Ford Motor Company, Detroit.—Henry Ford made a name for himself which will cling for all time when he handed out a replica of a full-fledged automobile of the four-cylinder type at the price of a runabout—nay, at the price of the cheapest runabouts. Model T of the Ford line is in the same class, in that it is all automobile and no price. The Ford process ends in the delivery of nearly a hundred automobiles every working day, and, in spite of the low price, the quality of the cars and the enormity of the undertaking, it is generally conceded that Ford makes money.

GAETH: Gaeth Automobile Company, Cleveland.—Paul Gaeth is surely an automobile engineer. He may try to crawl out of it as Edison once tried to say he was not an electrical engineer, but the monument is there, and all who read may know. The Gaeth line differs from cars as they may be regarded in general, in that the problems are solved in a manner such as leaves the footprints of genius all over them. Gaeth does not set up the claim that his is the only way under the sun, but the users of Gaeth cars say it is a mighty good way, and that is more to the point. The cars of this make were written up in "The Automobile" a few weeks ago, and more than a little attention was called to the fact that the ignition, for illustration, was an ingenious piece of work. The "close coupled" is a neat automobile, with a 38-horsepower motor, four cylinders, 4 7-8 x 5 1-4 inches bore and stroke respectively. The ignition includes a magneto; the water cooling is of the thermo-syphon system, and the transmission is progressive with three speeds and a shaft-drive. The Gaeth line includes a delivery wagon, which makes for success.

Another Newcomer—the Coates-Goshen, from Goshen, N. Y.

GYROSCOPE: Gyroscope Automobile Company, New York City.—Made by the Bloomstrom Mfg. Company, this product has secured quite a name for itself and is attracting its share of attention at the show. The speed changes are made by the transverse travel of a disc wheel across the face of the flywheel, and the increments of speed change are, therefore, as

The De Luxe Company Showed a Fine Model in White.

numerous as the increments of travel. The two-cylinder opposed motor is so disposed as to allow of this mode of procedure. In many respects this scheme is of great merit.

INTER-STATE: Inter-State Automobile Company, Muncie, Ind.—In any other business the older the company the more chance there would seem for commercial success. The automobile situation is different because there are not enough

Jacksons Were Shown in Profusion and Advantageously.

A Western Line of Good Ones that is Popular.

cars made to go around and if a company will make a point of building good cars, it will have little trouble in the act of getting rid of them. The Inter-State is a new car, but the designers seem to know what is expected and to produce just the kind of an automobile that is wanted by the patrons of the industry. The company very wisely refrained from endeavoring to put out a line of cars and having concentrated upon the one model it has the earmarks of that careful attention to detail so necessary to the success of a new company, if indeed it is not the secret of success in any case. The motor is a 4 1-4 x 5 inches bore and stroke respectively with four cylinders, dual ignition, and positive water circulation, as will be more clearly indicated by consulting "The Automobile" of December 31, in which tables of the data of cars were afforded. In divers ways the car is distinctive. The selective transmission is carried on the front end of the tubular housing of the propeller shaft. The motor is self-contained, and separated from the multiple disc clutch, since the clutch is in a compartment in the front end of the transmission gear set.

JACKSON: Jackson Automobile Company, Jackson, Mich.—Michigan seems to be the home of many makers of automobiles, and among them will be found the Jackson, which is neither last nor least. The model H "thirty" is drawing well, and it promises to be a popular Jackson model with the buying public as well. Some cars take with the public at large, and then there are the cars that are popular with hair-splitting experts, but Model H has decided to choose the "buying public" as its associates. Seems to be a good idea.

KISSELKAR: Kissel Motor Car Company, Hartford, Wis.—The Northwest is a favorable country in which to manufacture automobiles, because it is full of the finest mechanics, and materials are there in profusion. It is no wonder then that the KisselKar is well up to the mark. The price is low, due to the favorable circumstances attending its construction, and the company is well equipped to handle its vastly expanding

Kiblinger High Wheelers were Attractively Displayed.

trade. The new model "thirty" is something to take a look at, and the company has a "six" rated at 60 horsepower, using both the magneto and the Atwater-Kent system of ignition besides a lot of other equally good improvements.

LAMBERT: Buckeye Manufacturing Company, Anderson, Ind.—Originators of friction drives of the kind that have delivered satisfaction to users, the Lambert adheres to that method, which is a good indication of the practicability of the scheme, since to change would be a simple choice were the company so inclined. The line has expanded, and in numerous respects refinements have kept pace with time. Morse silent chains are used and with Rutenber motors, in conjunction with the Lambert friction drive, the line is in a way to prosper. Hyatt roller bearings are used wherever the responsibility demands anti-friction members. The new "thirty" is looked upon with favor.

The McCue Company's Exhibit—A New Connecticut Car.

Fine Taxies and Other Cars from the Hoosier Capital.

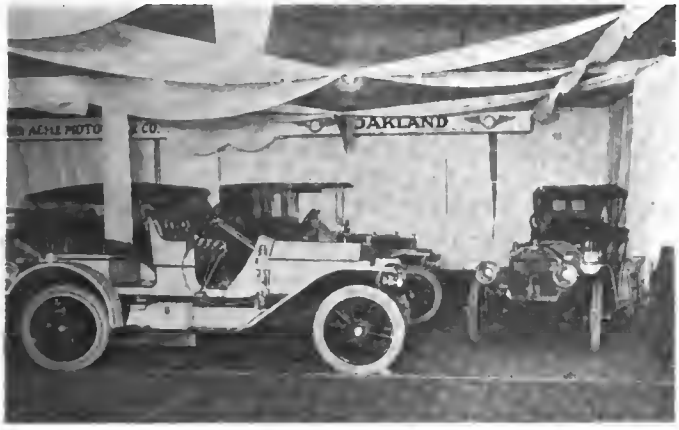
LANE: Lane Motor Vehicle Company, Poughkeepsie, N. Y.—The Lane has the distinction of being the "steamer" in the show. It is a pretty good illustration along steamer lines, and one would judge that the steamer contingent is widewake from the many who take a keen interest in the Lane, which is developed to a high state of perfection.

McCUE: McCue Company, Hartford, Conn.—The cars of this make are new to the visitors at shows, but the principles of the McCue are those of the accepted practices of recent years. In other words, the McCue is an up-to-date car with a four-cylinder 30-horsepower motor, selective three-speed transmission, cone clutch, and shaft drive. The car looks like a decidedly good piece of work, and there is no reason why the McCue should fail to entertain its audience. As a matter of fact, few go by the car without giving it the benefit of their distinguished consideration.

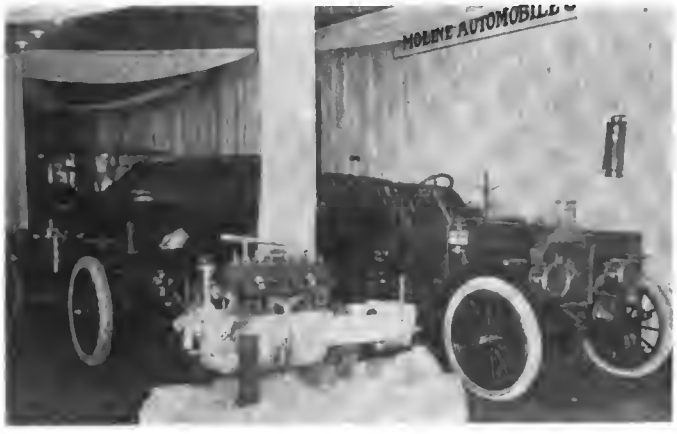
MARION: Marion Motor Car Company, Indianapolis.—The "six" of this make looks like something good, and the auto-

ists who make a point of studying cars must be of this opinion since they give it generous mention. This model is very complete, including a magneto in the ignition system and such other 1909 improvements as will be found on the more perfect cars of the year. The Marion line includes a "four" that is worthy of more than passing notice, if indeed it is not a car that should command the respect of the man with a pocketbook.

MARMON: Nordyke & Marmon, Indianapolis.—The new "32" of this line has the selective transmission swung in the rear axle, and the plant is one in which road inequalities can have little effect, even under the most severe conditions. The four-cylinder motor is of the water-cooled variety, and the cylinders are 4 1-2 x 4 1-4 inches bore and stroke respectively. The chassis frame is of the conventional type, the double three-point Marmon idea having been disposed of in this model. The three-point suspension principle is applied, however, and the motor is so suspended.



Oaklands from Pontiac, Mich., Made a Good Showing.



The Moline Had Ample Quarters—They Were Well Staged.

MAXWELL: Maxwell-Briscoe Motor Company, Tarrytown, N. Y.—"Consistency is a jewel," and it is the consistency of the Maxwell that has never departed from its stable abode. Maxwell cars are as numerous as the countless fireflies which illuminate the meadows in the lowlands, and in every case Maxwell is inscribed on the front of the approaching car, only to be repeated at every angle that parallels the line of vision as it intercepts the car. Maxwell stands for stability in design, and a buyer does not have to consider the question of the next year's car because they will look like the cars of the year before. The metal bodywork does not have to be replaced; a fresh coat of varnish, and the whole situation takes on the newness that can only be possible if the foundation is there. The Maxwell line is extensive, and the cars of the several makes, or models, properly speaking, are well suited to the work they are intended to do. In spite of a certain sameness which the Maxwell has adhered to, the cars of this make

Prize Winning Pullmans and Some Trophies They Won.

have kept abreast of the improvements wrought in materials, and in the several details of any moment. The thermo-syphon system of water cooling that has been a success on these cars is, of course, retained, and the main features have proven to be so good that to change to some half-baked new ideas would have been foolhardy. The little runabout at the low price of $500 is taking like hot cakes, and the doctor's car is one of the best of the line. The "double-opposed" touring car is still a very popular automobile, while more pretentious cars are available for the autoist who can afford to pay more at the hands of the Maxwell.

MIDDLEBY: Middleby Automobile Company, Reading, Pa.—The cars of this make are made in the shop once famous for the production of the Duryea. The situation is apparently well in hand, and the company offers a rather promising looking proposition by way of a runabout, and a surrey type is also built.

MIDLAND: Midland Motor Company, Moline, Ill.—With two models to choose from, the patrons of the company will surely find one to please. The Model E, for illustration, has a motor the cylinders of which are 4 1-4 x 5 inches bore and stroke respectively, and with four cylinders is rated at 25-30 horsepower. With a three-speed selective transmission, and evidence of good methods of design all the way through, it does look as if the Midland will make a good showing. The second model is with more power and is a more pretentious car in keeping with the difference in price.

MITCHELL: Mitchell Motor Car Company, Racine, Wis.—Racine is one of the greatest industrial centers in the State, and the Mitchell is one of the leading industries to be found there. Mitchell cars are in great numbers on the road, and even some of the oldest of them seem to run quite as noiselessly as any car should. The company took time by the forelock and

Pennsylvanias Shared This Space With Quinby Bodies.

The Top Gallery Decorations Artistically Blended into the Scheme Without Any Overdoing of the Plan.

put out a popular-priced touring car, which for size and general getup is of the greatest merit. The leader of the line is the "thirty," a four-cylinder car of the conventional sort, using a dual ignition system including a magneto, and in other respects it is plain that when a Mitchell is purchased at the price of the car, the purchase price is not merely a license to spend more money.

MOLINE: Moline Automobile Company, East Moline, Ill.—The Model M of the Moline line is a low-priced car which is attracting a good deal of notice. It is rated at 24-horsepower, and the cylinders are 3 7-8 x 4 1-2 inches bore and stroke respectively. The car is very complete, and should be a quick seller to autoists of discrimination. Model K is a higher powered car, with all the Moline earmarks.

MOON: Moon Motor Car Company, St. Louis.—The Moon ideas are still present in the products of the company, and getatableness is the underlying principle. True, the designs have grown and amplified, but the germ is there, and it is not one to be lightly thrust aside. Every autoist knows that trouble can creep into any part of a machine, and to be able to see, feel and work on the parts that require attention is a necessity if a repair shop is not carried along. Moon car work belongs to a school that can well be allowed to expand, and the models at the show are receiving a fair share of the attention of the visitors.

MORA: Mora Motor Car Company, Newark, N. Y.—Of "sealed bonnet fame," with cars which are looked upon by the autoists so fortunate as to own one as a possession enough for a king. The light six is a fine illustration of Mora practice in which the motor is rated as 42-50 horsepower. It is with six cylinders, 4 x 5 1-8 inches bore and stroke respectively. The selective three-speed transmission connects with a shaft drive, and the wheelbase is just about right, considering 36 x 3 1-2-inch tires, to give to the "light six" all the characteristics of road performance to be used to advantage. The Mora line is complete and interesting.

NATIONAL: National Motor Vehicle Company, Indianapolis.—In the class with the advanced designers along lines consistent with the accepted practices as they stand approved by the autoists of experience and discrimination, the National will face the world with two "fours" and a pair of "sixes." These cars have ball-bearing crankshafts, and since it is not new with them, it is assured that the ball-bearing crankshaft is well worth whatever the cost may be, although it is a fact that National cars are not high priced, if account is taken of the plan on which they are built. As a matter of fact, a "six" at $4,200 is a car of wide promise at a very low price, as automobile value goes. In the cars of this year, of the make under discussion, will be found many refinements, the character of which will round out a line of cars long regarded as prominent.

OAKLAND: Oakland Motor Car Company, Pontiac, Mich.—Put to a wide range of uses and well up in the scale of quality cars, once the "Spain castles" of the autoists who lent support to the industry in its infancy, who by their experience were enabled to picture in the mind's eye what a truly good automobile would be like. Many of the sturdy supporters of the industry now sport cars like the Oakland, and they are a contented lot; even the "old grumbler" who would kick if he drew a box seat in heaven, will be found purring like a contented cat in an Oakland. Take the Oakland "40," for instance, with its four-cylinder motor, with cylinders 4 1-2 x 5, 112-inch wheelbase and 34 x 4-inch tires. The car is one to give good satisfaction, and the price is $1,600.

OMAR: Omar Motor Company, Newark, N. Y.—It would be jolly to be a "kid" if only to own one of the little Omar cars, built especially for boys and girls. The Omar is a real automobile, only it is the smallest real car offered and is intended to make life worth living—as a boy.

OVERLAND: Overland Automobile Company, Indianapolis.—With two additional models and all the features of Overland merit rounded out in a manner to suit the most fastidious, this company is in a position to do justice to its reputation. The new "six," with cylinders 4 x 4 1-2 inches bore and stroke respectively, is rated at 45 horsepower, which, with magneto, and all the improvements that belong on any automobile, makes a car that should take rank with the road performers of the day. The flexibility of this car is favorably commented upon, and as to the materials it is understood within the circle of the knowing ones that everything is all right.

PENNSYLVANIA: Pennsylvania Auto-Motor Company, Bryn Mawr, Pa.—This company, with a well-arranged plant and every facility for the purpose, has a fine line of cars to offer and they are attracting the notice of buyers of acumen. The model D 28.9-horsepower car with a four-cylinder motor, 4 1-2 square, is one of the line that seems to sell very well indeed. The price, $2,100, is well within reach and the car at the price is one to consider.

PULLMAN: York Motor Car Company, York, Pa.—The model K Pullman is a car at $2,000, with a 4 1-2 square, four-cylinder motor, ignited by Bosch magneto service, in which the details are worked out in a way consistent with the good qualities of the car as a whole. There is a certain simplicity about Pullman designs that seems to be difficult of attainment; and it is a good idea to tie up to. The Pullman line is complete, and there is also the fact that it is a product built under the direction of the company's own men in all particulars

PREMIER: R. M. Owen & Company, New York City.—The "six" at $3,600 and the "four" at $2,500 make a fine pair, which, coupled with the performance of these models, accounts for the success of the company. It was one of the "Premier" cars which went and went until it collected some twelve successive centuries in as many days, and the worst thing said of it by the judges was that a brake-shoe "dragged" slightly, otherwise the brakes were unimpaired. It was understood among the members of the "inner circle" that the car did not have a fair show even as it was, because it had to be rushed to completion to be ready for the test on time. Of course, the Premier methods accounted in a measure for the fact that the "rush" did no great harm. A rigid system of inspection may be a nuisance according to the man who would like to get through, but it shows up well in a pinch and when it does not come to the surface it is still there "just lying dormant" awaiting the emergency which will ultimately render its presence manifest.

REO: Reo Motor Car Company, Lansing, Mich.—The $500 Reo runabout is so well and favorably known, and has so many thousands of users, that anything which one might say in its favor would be "stale news." This car formerly sold at $650, and while the price is lower this year, the quality is better if anything. The roadster will sell for $1,000, and so will the touring car. Both of these cars have the same chassis, and the double opposed motor is rated at 22 horsepower, which is conservative enough for a double opposed motor with cylinders 4 3-4 x 6 inches bore and stroke respectively. The Reo is a "sweet" running plant, and the fellow of the lean pocket book can well afford to look it over.

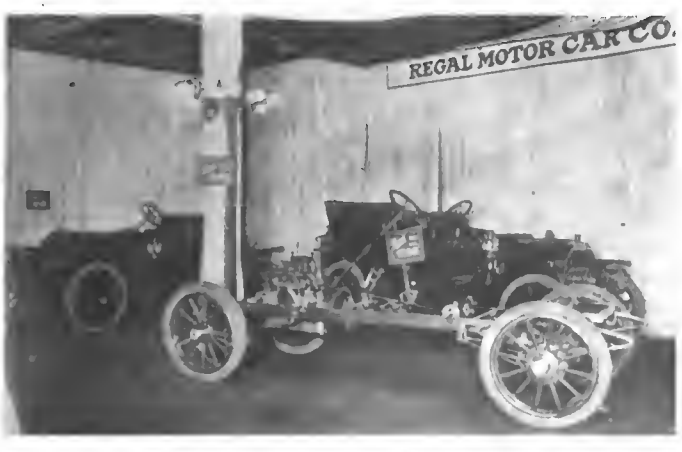
REGAL: Regal Motor Car Company, Detroit.—"The day of the inflated ideas and the enormous profit is past." So says the Regal. It must be when the four-cylinder "thirty" sells at $1,250 and especially in view of the fact that the car is in every way a "conventional" proposition with just the design and the features that are supposed to be characteristic of a real automobile. The wheelbase is 105 inches, and the control is absolutely standard in every way. With a high tension magneto, water-cooling and a carbureter that eliminates dead points, the flexibility is thoroughly good in every way. As they say, if just a good automobile is wanted, "look it over."

SPEEDWELL: Speedwell Motor Car Company, Dayton, O.—Difficult to get near enough to the exhibition to have a good look at the Speedwell. Fortunately, data was available from more reliable sources, and the general appearance of the car accounts for the "congregation." Must be a congregation, didn't look like a "soup house" contingent, and if they were short a few cents to make up the requisite $2,500 they could easily borrow the difference on an "I. O. U." The motor in the Speedwell "40" is of the four-cylinder water-cooled type, with "Bosch" magneto and cylinders 4 3-4 x 5 inches bore and stroke respectively. A selective three-speed transmission serves as "catcher" for a cone clutch, and the shaft drive leads to a live rear axle with Timken roller bearings to take the brunt of it. The 34 x 4-inch tires do the rest, and they are about the right size to be sure of the result.

SHARP: Sharp Arrow Automobile Company, Trenton, N. J.—Full 40-horsepower, no discount, assured since the four-cylinder motor has 5-inch square cylinders, and the "Bosch" magneto does the rest. The Sharp is just such a car as one would expect to do a mile-a-minute and not get out of breath. All the features are along recognized lines, and the car is attracting a good deal of favorable comment. The materials are rather good, and the distribution of the materials used is in accord with the actual needs in view of the arduousness of the service.

STODDARD-DAYTON: Dayton Motor Car Company, Dayton, O.—The last few years have seen a fine display of the cars of this make, not only at the shows but on the road. It is a little difficult to go anywhere and not see a shapely and graceful Stoddard-Dayton under happy auspices every once and a while. For $2,500 the four-cylinder 45-horsepower is a thoroughly good proposition, and with a roadster body it is a road performer of no mean merit. The cylinders are 4 3-4 x 5 bore and stroke respectively, and with a magneto for ignition purposes and a good control all around, this car with its rather long wheelbase performs extremely well. It is a shaft-drive with a three-speed selective gear, well designed live rear axle, and the wheels are fitted with 34 x 4-inch tires. The touring model is in brisk demand, and the company belongs to the class that starts out right and do not have to come out with revisions every season. True, the Stoddard-Dayton is kept up to date—strictly, but it is rather well understood that "revisions" are by way of the elimination of mistakes in most cases. The cars of this make at the show present a fine appearance, despite the "jam." Certainly it would be well worth while to look them over in detail, under conditions such as would enable one to enjoy what seems to be a picture in harmony. Then, there is the assurance of past favorable performance.

WELCH: Welch Motor Car Company, Pontiac, Mich.—If Pontiac, Mich., never produced anything but the Welch automobile, it would still be doing its full duty to the nation. The visitors at the show with few exceptions will be wholly unaware of the fine qualities of the materials used in the Welch models; they will not know that the alloy steel in the crankshafts is the choicest of the choice. They probably will not appreciate the refinements in design that cost "midnight oil" and not a few of the spectators would say, "what's the use." On the other hand, it is just such painstaking care and the use of fine materials that make automobiles in the long run. If a pioneer cannot realize in coin of the realm, he can be satisfied with being right as he sees it, and he will surely benefit the industry as a whole in the long run. The Welch models at the show are attracting the visitors, and it is pleasing to note that a good many of them know a good car when they see it.



This Newcomer from Detroit Attracted Much Attention.

This Old-timer of 1876 Has a History, Told Elsewhere.

The Popular Renault Was Shown by Numerous Models.

A Pioneer German Car that Is Making Headway Here.

AMERICAN STATUS OF FOREIGN AUTOMOBILES DEFINED

THE law of the survival of the fittest will apply to this situation as it does to every undertaking. All that remains is to define the fittest and the situation will be as bare as the Sahara. In the first place, the fittest in France, or in Germany, or in Italy, will not of necessity fill that coveted niche in "the land of the free." American roads may have much to do with the situation, but it is the American method of doing business that must in the long run obtain.

In America, for illustration, it is but to a small extent possible to trade on precedent. What Mr. A. does, the car he prefers to air himself in, will not serve for long as a "puller in" for all mankind in this country, because all are not sheep. Then, again, there is the question of discrimination to take into account. In this country it will not do to "discount" Mr. A. and "soak" Mr. B. Some of the buyers will stand for it, for the reason that "social" considerations will control; but in the long run it is not an American method, and the name—discrimination—once it is on the tag of a company will have much to do with the future of that company. Then there is the question of selling cars on a basis of "new," when, as a matter of fact, they are not new—after they change hands a few times. Moreover, the idea of giving a chauffeur say $1,500 if his "master" buys a car is bad. All these methods bode ill for the company that does business on such a basis, and while it may take time to have the cat get out of the bag, the fact remains that the cat will get out.

Of the foreign companies doing business in America it is a fact that the companies whose business methods are sound are the ones that will remain, and they are the companies which cater to the wants of the community delivering a dollar's worth of automobile for a dollar. The dollar's worth of automobile should include a profit for the maker and the cost of dealing with the purchaser; but there is no reason why it should include a house and lot for the chauffeur. The car should be brand new, and it should be in good working order, or the seller should stand behind it for a reasonable length of time.

The average maker of cars in America knows full well that there is an everlasting penalty attached to the gross violation of sound methods of doing business, and if he expects to stay on the market, to avoid undue pitfalls is the natural thing to do. The wise ones from "the other side" with good cars to dispose of have refrained from offending to the greatest possible extent, possibly to the same extent that the American makers have kept away from "the pace that kills." At all events, it is a case of the survival of the fittest, and the fittest is measured in terms of business stability now that there are enough "good" American cars to go around. There are now no secrets in connection with the question of materials, and American makers were always in a position to furnish machine tools in keeping with the most exacting situation, so that it is a fair inference that quality resides in cars from several sources.

When it comes to skilled labor, the educated workman will in the long run prove to be the one of dependable characteristics, and if he does get more dollars per week, he does more work in a week, thus giving to the patrons of the industry the benefit of brains, after they have gone through a course of sprouts.

That the foreign automobile has been a blessing in more ways than one is to be conceded by any fair-minded man, but it does not follow that the foreign maker can cash his check more than once. On the whole, even taking all these matters into account, it is a fact that some of the foreign cars are certain to survive, primarily because the cars are good, and again in view of the business acumen of the men behind them. They are the men who know the peculiarities of the American, and they do not risk loss by grossly offending.

RENAULT: Renault Frères Selling Agency, New York City.—The foreign car situation is not in a precarious state as far as this agency is concerned, for there is a good demand for the Renault, which car has earned and maintained a reputation in America that will hold it in good stead in the future. The Renault has always maintained that it is not good business to build fine racing cars, and on the reputation gained by them exploit the American public. As a result, the Renault exhibition is well patronized, and there are evidences of undoubted prosperity in the Renault zone of activity.

LANCIA: Hol-Tan Company, New York City.—The famous racing driver of this name, who made so many friends while in this country, seems to have imparted some of his enthusiasm into his product, for to say that this little car has "taken" would be putting it mildly. A motor with 3.5 inches bore and 3.9 inches stroke, driving through a selective type transmission to a final shaft drive, furnishes power sufficient to accomplish some surprising results. With the same cylinder dimensions a "six" is also built, the wheelbase being increased from 110 inches to 128 inches for this model. The special chassis, the "Lampo," which won the light car race at Savannah, has slightly larger bore and in general lighter construction throughout.

BENZ: Benz Import Company of America, New York City.—This company is not so well known to the American public, but it has ample opportunity to show its business acumen, and the reputation it brings from the other side is such as to serve as a good introduction. The Benz car was one of the pioneers of the world, and it is a dominant factor in Europe, both in racing and in the more useful fields of endeavor. Benz cars are to be had in the several customary sizes and with optional bodywork on a scale not to be outdone in pleasure cars.

GREATEST PROGRESS POSSIBLE IN TAXICAB SECTION

ONE of the most marked phases of the taxicab situation, with reference to the progress made in the past year and the changes brought about in the working out of this progress, is the great gain in favor for the left-hand control. The strange part of this is the fact that left-hand control was tried, condemned and abandoned some years ago. To-day for taxicab use it is in favor, and most of the newer makes exhibited for the first time are so arranged.

In cars arranged essentially for public service use, the tendency toward unit construction, each unit being of the "quick detachable" type is very marked. This works out in engine arrangements which allow of a complete change in forty minutes, transmission layouts with which a shift to a new unit can be made in twenty minutes, and similarly with axles, clutches and other vital parts. In the way of giving the maximum possible mileage from a chassis, and consequently the maximum of profit, these arrangements come as near being perfect as is now possible.

Dropped frames allowing a very low center of gravity, and, incidentally, less racking, are now very general, while in conjunction with them three-quarter elliptic rear springs are universally used.

More provision is now made than formerly for baggage, the single front seat leaving a large space which, when suitably ironed, is very serviceable for this purpose.

A tendency is shown toward lower powers, the argument being that the public service car of hard usage must have a marked economy of operation to offset the high depreciation factor. This is only obtained with the very efficient and small motor. To carry the argument further, the manufacturers say that it is better to be underpowered 5 per cent. of the time and economical for 100 per cent., than to be overpowered for 100 per cent. and economical for 5. This is good logic from the point of view of the cab operator, as one spells failure while the other has success written on it in large letters. As bearing out this line of argument, witness the 10, 12, 14, 16 and 18-horsepower cabs shown, varying from a single cylinder up to "fours," most of the latter being *en bloc*.

ATLAS.—The new and growing field of the taxicab and its closely related field, town cars, are both well represented, the American makers vying with the foreigners as to who shall show the greater number. The foreign makers, however, are behind in one respect, viz., they have never paid any attention to the two-cycle motor; at least to qualify this, the makers represented at the Palace show have not. So in the two-cycle field of the taxicab makers the Atlas Motor Car Company stands alone. This company show a taxicab with their two-cylinder, two-cycle, 4 1-2 by 4 1-2 motor with offset crankshaft. As a public service vehicle the simple ignition system would be a big talking point, since it allows in part for a driver of lesser intelligence.

C. G. V. TOWN CAR.—The sloping hood made famous by this company is continued, the radiator now being placed in front of the dash instead of low down in front as formerly. Following latter-day practice, no torque rod is used, the shaft encasing tube which is made to take torque being strengthened above and below by light but strong truss rods. The motor is of the style now popular for small powers; that is, with cylinders cast *en bloc*. This maker pays particular attention to the proper relations existing between the tread, wheelbase and steering lock, with the result that an unusually short turning radius is obtained, almost short enough to turn in a Boston street.

DE DION TAXICAB.—One of the oldest and most successful of French makers, having specialized on single cylinder vertical motors, would naturally be expected to do something nice in the single cylinder town car section, and in this respect the De Dion-Bouton Company's exhibit is no disappointment. Following the latest foreign practice the dash is clean, all accessories being under the hood. This gives the car an excellent appearance when viewed from the side, the clean businesslike look being a very favorable one.

FORD CAB.—The most noticeable feature of this cab is the left-hand control, which allows the driver to look back, which is a big advantage in crowded streets. These enclosed cars showed up very well, the body work and upholstering surpassing the usual work of this nature turned out by this company. The Model T was shown in both landaulet and limousine bodies, either one of which would be suitable for town car work, although for taxicabs the former is usually fitted. A short wheelbase and a narrow tread give a very short turning radius, particularly desirable on the public service cars.

GENEVA CAB.—Among the many newcomers at the show, none made a better appearance than the Geneva cab, designed by Louis Mooers and shown for the first time. In common with many of the older makers, this company has decided to use left-hand control, a single driver's seat being fitted on this side with a large trunk space on the right side, suitably ironed to prevent damage to the car. A frame with a big drop just forward of the rear axle and the use of three-quarter elliptic springs gives the required low center of gravity with good riding qualities. In the construction of this vehicle, the manufacturers have taken the stand that public service cars or taxicabs are subjected to unusually severe strains, not only from the nature of the service, but from inexperienced drivers and a desire on the management's part to keep the car in operation as much as possible. A clean dash of selected circassian walnut, an aluminum foot and toe board and a Ewing landaulet body, combine to give a very harmonious picture.

ROCKWELL CAB.—The Bristol Engineering Company has developed the Rockwell public service cab. A close inspec-

Where the Lancias Were Shown by the Hol-Tan Co.

Designer Mooer's Geneva Cab—Cleveland Autocab Co.

tion of this shows a very clear insight into the work that such a car must do and a very ingenious design with the idea in view. This car is all new and in no sense a copy. Commencing with left-hand control, continuing with *en bloc* motor, absence of spark advance, guard for radiator front, quick removable motor and transmission both on three-point suspensions, etc., right through, the thought bestowed on the design and construction is self-evident. In the matter of ready removal of either engine or transmission, it is said that the former may be taken out in less than an hour, while half that time will suffice to replace a transmission. In getting maximum mileage out of any given chassis, this feature will add a great deal, for by having extra engines and transmissions in stock, the change can be made in about the time necessary to get out another substitute cab.

SULTAN CAB.—The majority of manufacturers in starting the production of a taxicab were obliged to copy from some other manufacturer or go through the bitter trials of experimentation. The latter course, if sufficiently remote, is by far the most preferable one, so that any company which can truthfully lay claim to being a pioneer has a big advantage over competitors. This holds true of the manufacturers in this company of the Sultan cabs, the Sultan Motor Company, which, although but four years old, is building under a license from the old French firm of Lethimonnier & Cie.

MOTOR BUGGY ADVOCATES PLEASED AT THE SHOWING

NOT to be outdone by the larger and more expensive heavy trucks or the smaller and more costly cabs, the buggy type seems to gather to itself more friends every year. The number of exhibitors was greater, the number of cars exhibited was increased in numbers, both by a natural increase and by the greater number of exhibitors. The progress shown in this category is none the less marked because it consists mainly of improvement in small details rather than principles. The latter was proven correct years ago, and now it only remains to put on the finishing touches.

A decrease is to be noted in the size of wheels, but this is probably a sacrifice to appearances rather than the abandonment of a principle, the idea being to look as nearly like the touring car as is possible without altering other things. This is not carried to extremes, 34 inches being the popular as well as the minimum size. The use of water-cooled motors seems to have gained a little ground on the air coolers, as has wheel steering over the more simple lever. Some offshoot of the newer cab tendency to place the control on the left side was also seen.

ANDERSON.—These are being used largely in the Middle West by doctors, salesmen, collectors, farmers and business men in general. Their use is extending hand in hand with the pleasure car of small wheels and pneumatic tires, and women learn to drive them readily because of their simplicity, lightness and ease of operation. Three models are produced—A, B, and C, the latter having an optional equipment which includes artillery wheels with 30 x 3 pneumatics. All models are equipped with a new type of air-cooled motor of superior efficiency, having the valves in the head. The drive from the planetary transmission to the jack shaft is by single roller chain and to the rear axle by double chains, the latter being very short. Wheel steer is provided on all models. One interesting point brought out at this display is that the ordinary divided countershaft is weak because divided.

BLACK.—Another Chicago firm specializing in this type of car is the Black Manufacturing Company, of Chicago, which showed a number of types. These vary in bodies and wheel base, the largest having a nine-passenger body suitable for station wagons, summer resort use, etc. The smallest, on the other hand, is Model 12, a smart two-passenger runabout. The latter is the firm's leader for the coming year and is one of the lowest priced cars made anywhere. This, placing it within the reach of the multitude, should result in large sales, particularly as the details of the car show merit. One most peculiar thing on this car is the double frame. The rear axle, front axle and the tie rods joining them form one, the lower, while the upper framework of angle iron carries the power plant.

HOLSMAN.—The oldest and largest of the motor buggy manufacturers, the Holsman Automobile Company, of Chicago, were unfortunate in their choice of space, the section selected coming next to and across the aisle from high-priced high-grade touring cars. The comparison between the two made by the ordinary showgoer would therefore be less favorable to the former than it would have been if located among the motor buggies. In the latter situation the many meritorious features which have kept this car in the foreground and helped it to win the many reliability contests would have appeared to better advantage. This maker has steadfastly adhered to the chain cable, the final drive being a specially prepared cable, while the secondary drive to the transmission shaft is by silent chains, this feature making for noiselessness. In opposition with others who have slavishly followed automobile practice and fitted a steering wheel, this firm has continued to use lever steer, and all cars exhibited are so fitted. For the coming year a new higher-powered car with four-cylinder motor will be featured, known as Model H-15.

INVINCIBLE SCHACHT.—The increased number of high wheelers exhibited was a fair criterion of the increased interest in this type of car. It is said of one county in Kansas that six hundred machines are owned and another hundred ordered, of which over three-quarters are of the high-wheel type. This car appeals to the farmer and people in rural districts because of its inherent simplicity, lack of noise and low upkeep cost, due to fuel economy. This Cincinnati firm, the Schacht Mfg. Co., is prepared to get their share and more of this business with a simple, practical and economical car.

KIBLINGER.—While in the motor buggy class, the name of high-wheeler really is a misnomer for these cars, as the wheels are not high in the accepted sense of the word, 34 inches being the standard size on all models regardless of body, passenger capacity or type. In every other feature, however, this product follows in the lines of construction peculiar to the high-wheel cars or motor-buggies, as they are sometimes called. The power is furnished by a two-cylinder horizontal opposed air cooled motor, and varies, 13½ to 16 horsepower being furnished on an equal number of classes, three each. In addition a larger model with 27 horsepower is now listed.

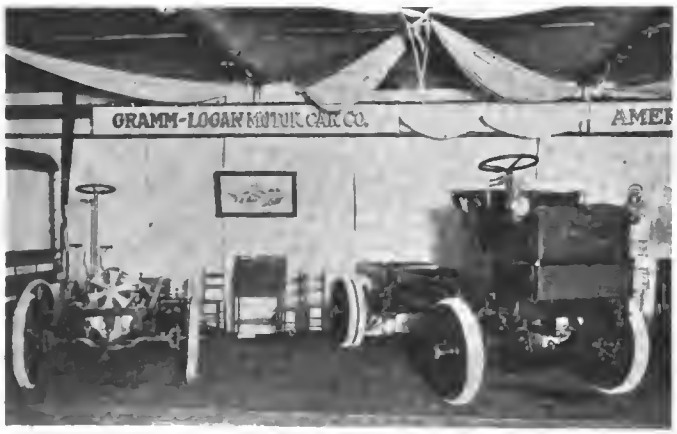
RELIABLE DAYTON.—Chicago seems to be the home of motor buggies; at least one might be inclined to think so, judging from the number of large manufacturers of this type of car located there. The firm in question has produced a thoroughly reliable machine of this type, so much so in fact that it has been dubbed "the first real successor to the horse." This reliability is brought about by the utilization of a water-cooled engine and of a sliding gear transmission. This sounds big and complicated, too much so in fact for a motor buggy, but as worked out in practice it is so small and compact that it would go in your hat. In fact one visitor at this company's exhibit overlooked it entirely, and looking at the chassis on exhibition, asked where the transmission was! Despite the extra cost of double chain drive over shaft drive this concern has stuck to the chains, and expects to continue using them forever. Following the better-touring-car practice, brakes are in the rear wheels, both internal expanding. A liberal use of ball and roller bearing throughout the car adds to the price, but also to the durability in a much larger proportion. The Reliable Dayton Motor Car Company, Chicago, is the manufacturer. The company reports good business and comment on the product is decidedly favorable.

HEAVY TRUCKS SHOW MARKED ADVANCEMENT

By MORRIS A. HALL.

WHILE not as marked as its spread through the list of heavy trucks, the essential improvement in the other commercial fields, viz., the quick-removable unit construction, the left-hand control and other ideas, all made progress. This field was extended somewhat by the return of two of last year's exhibitors under new names and with an infusion of new life and many new ideas. Also, by the addition to the heavy car list of one of the light commercial car manufacturers. The latter showed for the first time a very heavily constructed truck rated nominally at five tons, but easily capable of a 60 per cent. overload. The bare fact that the maker tested it out under this excessive overload would show that our commercial manufacturers are learning fast the conditions under which their product works.

The exhibition of one of the best foreign trucks with a whole host of new ideas was one that doubtless was good for our builders. This truck is fitted with a self-starting device that actually works, an arrangement for using the motor as a brake by running it two-cycle and thus doubling the compression or



The Logan Was Easily Distinguished in New Guise.

Rapids Were Shown in Profuse Sizes and Styles.

braking strokes, fully lubricated springs and shackles, an unusually efficient carbureter and other features which will, at least, give our manufacturers food for thought.

Among the domestic trucks, the use of sprags to prevent a car backing down hill is on the increase. These do not always take the same form, some using but one, while others show a preference for two. The added weight in proportion to the total is so very slight that it would seem as if (granting that they are worth while putting on) two was the correct number. One maker very cleverly adopted a feature of railroad practice when he placed a sand box on the rear of the chassis with a lead to the ground a few inches in front of each rear wheel. A foot button is arranged to open both valves so that on reaching a slippery place the driver simply presses the button and sands the rails, so to speak.

Increased attention has been given to the running gear, if one may so designate the axles, springs and wheels. Axles are larger and heavier than before with stronger reinforcements. The new big truck, for instance, had a rear axle 4 1-4 inches in diameter of very heavy steel tubing. In the line of springs, superior material is being used and lubricated in some cases. This, while not a good report, is a positive advance over previous years. Wheels throughout are heavier, and now that prices have been cut, we find larger tires freely used. The use of twin rear tires is universal, but the full solid is losing some ground in favor of the sectional block or partially replaceable tire. No examples of wooden or steel tires were to be seen, although makers are known to be experimenting with the former type.

The question of final drive stands still, no new opposition has developed to the double chains, no new chain covers or boots are shown and no advocates of this drive have changed sides. This situation is anomalous, to say the least, that the buying public should buy these drives without a cover for the dirt. From the manufacturers' side, the idea seems to prevail that there is no use complicating the situation and adding to the cost until the public demands a cessation of noise and is willing to pay for it. The silent chain drive so prevalent in England and elsewhere abroad has made no progress on this side, strange as it may seem.

Bodies on heavy trucks were few, most builders being willing to expose the mechanism to the public and explain the working of the same to the uninitiated. The few bodies shown gave evidence of a more advanced stage in wood working, as well as superior painting, trimming and upholstering.

AMERICAN: American Motor Truck Company, Lockport, N. Y.—Along the row of big trucks in the commercial vehicle section of the show, the product of the American Motor Truck Company was to be found occupying a central position. The exhibit consisted of a five-ton standard truck chassis, which is unchanged from former years with four-cylinder motor, having individually cast cylinders, valves on the left, a governor for regulating the speed, planetary transmission, double side chain drive, and very heavy construction throughout, as would naturally be used on a truck of this capacity. The feature of the exhibit, however, was the showing of one of the new models. This was a one-ton delivery wagon known as Model S. This new "American" shows a few departures from the larger previous constructions, but these are more in the nature of up-to-date refinements than radical changes. The engine is a four-cylinder unit rated at 25 horsepower and has the cylinders cast in pairs with valves on opposite sides. From this very neat and compact power unit the drive is by shaft to a sliding gear transmission and thence by double side chains. While any type of body may be had the one shown was the standard box or delivery wagon body. The neat lines of this showed that the American people have excellent facilities for turning out good work, being an excellent sample of the body-builders' art.

For the coming season this company is listing for the first time, besides Model S just mentioned and the two old standbys, the 3 and 5-ton trucks, Model M, 1 1-2 and 2-ton truck, Model T, 1,000-pound delivery, and Models E and D, 16 and 20 passenger cars, respectively.

ATLAS: Atlas Motor Car Company, Springfield, Mass.—At the Atlas stand, hidden away in one corner, was one of the neatest little delivery wagons shown. This little power wagon was half hidden among the more popular touring cars, runabouts and town cars which surrounded it, but any one really interested in the work vehicles could not miss it. The body and

general chassis lines follow standard practice, but the main feature which makes this car different lies in the power plant, the principal part of the car. In this case it is an excellent example of the two-cylinder, two-cycle motor to which this firm has pinned its faith. A second feature which will be noted is the control, this being grouped on the left-hand side contrary to usual practice. The idea in this case is to allow the driver to look back when obliged to stop or reverse. With a weight of 2,300 pounds, a carrying capacity of 1,200 pounds and a motor conservatively rated at 20 horsepower, this car, known as the car that "delivers the goods," is well equipped and should show up well in actual service.

BRUSH: Brush Runabout Company, Detroit, Mich.—The prime feature of the Brush exhibit and one that was given the place of honor was the little runabout that climbed Pike's Peak. With all of the Western dirt and grime still on it, this sturdy little customer still looked ready for more. Besides this veteran and a sample pair of Pike's Peak-eatan tires, a delivery wagon, three passenger runabouts and chassis were shown.

CARTERCAR: Motorcar Company, Pontiac, Mich.—This strenuous advocate of the friction drive, recently removed from Detroit to Pontiac, Mich., where larger facilities are available, showed a model of each of Type H and the new Type K, as well as a convincing example of the friction drive in operation. The touring car chassis and the sample transmission shown served to show the delivery wagon made by this firm, the departures being (aside from the body, of course), few and insignificant, such as wheels, tires, etc. The success of this friction drive has been astonishing to advocates as well as skeptics. In fact, in the hands of this company so much progress has been made with it that they are offering a thousand dollars to any one who will slip the discs.

COMMERCIAL: Commercial Motor Truck Company, Philadelphia.—Another exhibit which was hidden away in a corner where no one would see it was that of the Commercial Truck Company of America, but one who was interested in electric trucks would take the trouble to hunt them up and find a chassis of the 1,000-pound wagon and a 2,000-pound delivery built for John Wanamaker & Company. These have a single motor shaft drive using worm and gear, only the rear wheels being driven. On the larger models, however, four-wheel drive and steer is employed, the motors being mounted directly upon the wheels. This interesting type was not exhibited.

GAETH: Gaeth Automobile Company, Cleveland, O.—While not advertising nor showing a delivery wagon, the Gaeth Automobile Company are building and cataloguing one, known as Type K. This is a one-ton machine with a single cylinder motor conveniently located under the footboard, which is readily removable for inspection or repairs. This is fitted with an excellent appearing closed delivery body and the whole appearance of the car is good. The makers state, however, that they have had very little demand for power wagons and consider the production of one at this time a trifle premature, which is their reason for not exhibiting a sample of the Type K wagon.

GRABOWSKY: Grabowsky Power Wagon Company, Detroit.—With a single exception this young and energetic manufacturer showed the largest exhibit of commercial cars. These were four in number, consisting of a state truck, express truck, sixteen passenger sight-seeing cars and a chassis. The latter was used to demonstrate the idea of this make, viz., quick demountable power unit. The truck is constructed with this idea in view, and as a result the power plant may be removed and another one installed in a remarkably short time, some claim as short as 10 minutes. This is accomplished by mounting the engine and transmission on a subframe of inverted V section. This in turn slides on the top and outside of another permanent subframe of V section. By opening the front of the frame, disconnecting six unions and a few bolts, this whole power department may be slid forward. Then a short piece of angle with a roller at one end and a special connection at the other attaches to the ends of this subframe, four of these converting it into a truck with the engine and transmission on top.

HART KRAFT: Hart Kraft Motor Company, York, Pa.—There were many new faces to be seen, among which were the Hart Kraft Motor Company, with a new delivery wagon. This new company have wisely decided to concentrate their energies on a single type 1,000-pound delivery, which will be turned out in large quantities. This has a readily removable type of power plant, the engine, transmission, etc., being mounted upon a subframe which can be completely removed in less than an hour. This readily removable power plant idea is one that is gaining many friends and advocates every day, and the new company is to be congratulated on their foresight in choosing this feature.

LAMBERT: Buckeye Manufacturing Company, Anderson, Ind.—Among the numerous advocates of the friction drive is the Buckeye Manufacturing Company. This Indiana concern has gone in strong for it, and as turned out by them it has been a very successful device for the transmission of power. Whatever the individual may think cannot be put up against positive proof, as shown by such experiments as placing the front of the car against a brick wall, then turning on the power. This test the Lambert drive has gone through successfully a number of times. It is to be regretted that they did not show a delivery wagon, but the chassis and the various touring models shown conveyed the idea of the form of construction quite well, perhaps fully as well as the completed delivery would have, without wasting any space on the latter. An exclusive feature by this company is the utilization of a final silent chain drive, which, in conjunction with the friction transmission and a well-built engine, makes an absolutely quiet running car. This latter is a highly commendable feature.

LOGAN: Gramm Logan Motor Car Company, Bowling Green, O.—An old friend in new clothes would not classify as a new friend, so the Logan company under a new name will hardly come in the category of newcomers. These people showed two excellent examples of commercial wagons, one a 1,500-pound delivery car and the other a well-worked out example of a three-ton truck. The former shows very little change from the proven features of last year, including 25 horsepower, air-cooled motor, two-speed progressive transmission multiple disc clutch, double chain drive, etc.

The latter, on the other hand, while following last year's general lines, has a number of new features, many of them entirely original. Thus the fitting of a sand box to sand both rear wheels is a new one, as is also the use of hard steel rollers on one end of each spring in place of a shackle. A three-speed progressive gear set is out of the ordinary; so, too, are many of the excellent little details all over the chassis.

MAXWELL: Maxwell-Briscoe Motor Company, Tarrytown, Pa.—In bringing out their thousand-pound delivery wagon along the same lines that have been successful on thousands of touring cars and proven right by hundreds of tests, this company have made no mistake. This little work vehicle has the unit power plant multiple disc clutch and other features which have made the Maxwell a byword in every nook and corner of the land. The body work on a car of this sort does not need a piano finish, nor on the other hand would it be advisable to try to sell it without any paint or varnish. In this the Maxwell people have struck a happy average. The body has neat, pleasing lines and is painted and varnished just enough to make a nice appearance and wear well.

MANHATTAN: Mack Bros. Motor Car Company, Allentown, Pa.—This eccentric manufacturer shows the same as last year, one passenger car and one three-ton truck. The former, however, is a new departure in bodies, being of the sixteen passenger enclosed 'bus type arranged to be used for a pay-as-you-enter car. With this idea in view the driver is shifted to the left side, where he not only controls the car but the entrance and exit of the passengers as well. This type should have a good field in small towns.

LANSDEN: Lansden Company, Newark, N. J.—The attraction at this booth was the new dock truck especially built to work around docks, piers and terminals. This is a large platform, 14 feet x 4 feet and 28 inches off the ground, mounted on two wheels side by side equipped with 24 x 6 rubber tires and an additional manœuvering steel wheel at each end. The power is electric, Edison batteries being used and may be controlled from either end. Despite the ten-foot wheelbase, the truck may be turned around in its own length, owing to both front and rear wheels steering.

PITTSBURG: Pittsburg Motor Vehicle Company, Pittsburg, Pa.—The keen competition of recent years has had its result in the redesigning or improving of all cars. Particularly is this true of electrics. Among those electric commercial vehicles which have shown a big advance is the Pittsburg. This wagon has a very light weight for its carrying capacity, due to a superior battery of decreased weight and very light weight driving mechanism. Two cars are shown in the Palace exhibit, both new designs, one of 750 pounds and the other of 1,500 pounds capacity. Both of these are guaranteed for an overload capacity of 33 per cent., which speaks well of the maker's confidence in his product. Another strong point, although a little one, is the use throughout the car of standard threads and standard nuts, interchangeability and ready replacement being thus secured. This extends even to the wheels, all four of which are interchangeable.

RAPID: Rapid Motor Vehicle Company, Pontiac, Mich.—The largest, most complete and most interesting exhibit of commercial cars is that of the Rapid Motor Vehicle Company. Beginning with the new five-ton truck chassis and ending with the motor propelled chemical wagon, each separate car is of absorbing interest to any one vitally interested in these work vehicles.

The five-ton truck has many interesting new features. Among these are the use of the Hedgeland equalizer in place of a hit-or-miss differential, the telper spring above the rear axle, which only comes into play after about three tons of load have been put on, the sprags attached to the rear axle and operated by cables from the dashboard, the extra large tubular rear axle 4 1-4 inches in diameter, etc. The truck is built very heavy throughout, more so than its rating of five tons would warrant, so it is not surprising to learn that the factory have used it for weeks at a time with eight-ton loads.

Other exhibits are a very neat ambulance finished in white, a one-ton delivery, one and a half ton stake truck, one and a half ton standard chassis, twelve and twenty passenger sight-seeing cars, the Glidden tour truck, and in conjunction with the Tea Tray Company of Newark, a fire department or chemical wagon. The chassis of the latter was furnished by the Rapid company, while the equipment is by the Tea Tray Company. This consists of two large forty-gallon tanks connected to a reel of 3-4-inch hose. These tanks are arranged so that both may be used simultaneously for chemicals, both for water or one for chemicals and one for water: 250 feet of hose in 50-foot lengths is furnished on the reel. In addition, there are axes, crow bars, bell, lanterns, lockers under the three seats, a 24-foot extension ladder, four three-gallon and two or more one-gallon hand extinguishers. Indestructible steel wheels are used and the car is geared to 25 miles per hour. The capacity of 12 men is afforded by three cross seats and three steps each for two men.

RELIANCE: Reliance Motor Truck Company, Owosso, Mich.—This company, like the Logan, is an old friend under a new name, the new company having just completed and moved into a large new building in Owosso, Mich. The cars exhibited are a two and a three-ton truck, and in addition a transmission. The latter, resembling nothing quite as much as a bathtub, is of cast iron, showing the modern tendency to eliminate aluminum on power wagons. These trucks are unchanged in detail from last year, the most notable feature being the engine, which is of the two-cycle type. The majority of these trucks are sold in the Middle West, where they are doing good work.

REO: Reo Motor Car Company, Lansing, Mich.—Naturally enough the pleasure car manufacturers, who have branched out in delivery wagons or other commercial ventures, consider this a subordinate matter and give first thought to the touring and other pleasure chasses. This is very noticeable on the ground floor of the Palace, where half a dozen of the large firms, who are known to have a power wagon of some sort on their list, have carefully refrained from taking up any space to exhibit them. In this category is included the Reo Motor Car Company. The public suffers a distinct loss in not seeing the neat little delivery wagon turned out by these people. Of small capacity and correspondingly small size, the power is well adapted to the work. The narrow tread and short wheelbase allow short, quick turns with a consequent saving of time which, according to John D. Rockinghorse, is money.

SPEEDWELL: Speedwell Motor Car Company, Dayton, O.—This new firm's commercial venture was recently pictured in these columns so that none of the details or description will be repeated. At the Palace show the commercial end was not exhibited, neither a chassis nor a complete truck. The builders state, however, that the features of their successful touring cars, which are applicable to commercial work, have been utilized on this newer venture and guarantee that the power wagons turned out will be fully up to the high standard of their touring car practice.

STODDARD-DAYTON: Dayton Motor Car Company, Dayton, O.—The makers of this popular car, the Dayton Motor Car Company, have recently announced the completion of a full line of power wagons in one, three and five-ton sizes, others being added to the line as necessity arises. However, none of these were shown at the Palace, the large space on the ground floor being given over entirely to touring cars and their motive power. An excellent example of a sectioned motor was shown, the upper part of the crankcase being glass covered to show the oiling system, while other sections showed the valves in action, the working of the piston, etc.

THE MAXWELL-BRISCOE COMPANY'S FIFTH ANNUAL DINNER

IT was a "full house" that attended the fifth annual dinner of the sales organization of the Maxwell-Briscoe Motor Company, held Tuesday evening at the Hotel Manhattan. If anything were needed to supply evidence of the great growth of this up-to-date company, it certainly existed in the mammoth banquet hall filled to overflowing with district managers and agents from all over the country. Of course, Benjamin Briscoe, president and general manager, modestly told about the progress of the Maxwell, and J. D. Maxwell spoke most interestingly mechanically as to things here and abroad, he having recently returned from a visit to the Paris Salon. J. W. Wellington had for his subject "Accounting;" Ernest Coler spoke about "Advertising," and C. W. Kesley's subject was "The Hustlers," he being the superintendent of sales. There were other excellent talkers, including Creswell McLaughlin, an after-dinner orator of the gatling gun order, his rapid firing calling for close attention. Lee B. Durstine made an efficient toastmaster. There is another slant to a gathering like this, coming as the participants do from all over the country. When each had told his story, it was plain to be seen that New York alone is not the palm of the hand of trade activity. The Maxwell line of cars, covering as it does a type of car to fill every want, enabled the representatives of the company to deal with all sorts of people from all over the land. All America is automobile excited and the fever is spreading.

THE YEAR'S PROGRESS IN TIRE CONSTRUCTION

THE past year has doubtless been the greatest one in the history of the rubber trade, or to be more specific, in the automobile tire manufacturing business. In the automobile business every year shows progress, but this was not alone progress in that sense; it was an epochal year, a high-water mark so to speak. Following the lowest price of years for crude rubber, the past year witnessed a startling cut in prices. This cut was not made at the expense of the product, however, but was the natural result of three things, in almost every case investigated. These were: (1) the low price of the crude product mentioned above, which touched the lowest figure known in the past ten years, the same being equally true of fine up-river Para, Brazilian, and all other grades; that is, it was universal; (2) the completion of very extensive factory additions, some of which had been in the process of building for a very long time; and (3) the extreme outside pressure brought to bear upon the rubber companies by manufacturers and tire users, as a result of the hard times of the previous year and the extreme dullness in all lines of business resulting thereto.

With facilities equal to their enormous output and some natural future increase, and with improved mechanical devices installed coincident with the opening of large new buildings, it was possible to produce a better tire at a lower price.

Many and various were the improvements in factory methods which brought this about; thus in the matter of moulding or curing the complete tire the greatest improvement was manifested. This, which formerly took up three, four, and sometimes more operations, each of three to six hours' duration, is now usually completed in one operation of five to six hours. Not only does this save in time and material, but most of all the saving is in labor of handling, which is reduced to 20 or 25 per cent of its former bulk. As this is all high-priced labor, this big cut means a large amount of money as applied directly to a tire.

Notwithstanding the big cut in cost incident to superior methods of doing the work as shown above, it is now claimed that the single curing operation leaves the rubber in a superior condition to that resulting formerly when curing took several operations.

Tubes are now made much heavier than formerly, and consequently less liable to puncture or rupture under excessive internal pressure. The paper thickness of the first bicycle tubes has gown and grown until the tube in excess of an eighth of an inch in thickness is the rule rather than the exception.

In shoes, however, the greatest progress has been made. The former trick which rubber and fabric had of getting an absolute separation from one another has now been eliminated, so that at best it is but as a memory. This happened, too, in the past with some forms of raised tread, the tread after some severe wear parting from the body of the tire. Superior methods of construction have obviated this. In shoe construction the non-skid or anti-skid treads have had a great deal of bearing on the result attaincd. The modern tendency has been in this direction, and no manufacturing process which did not take it into account was worth much. Even the largest tires with the heaviest beading or with the Bailey tread can be cured in a single operation with the rest of the tire.

An additional powerful influencing factor has been the matter of construction through the shape of the beading or other lower portion of the tire. This particular subject is of more interest to some than the tires themselves, and this feeling is partly responsible for the great progress made with these. They vary in size, style, types, and weight with the different inventors and the companies manufacturing them. In general it must be said that they represent a distinct stride in advance in one method of attacking the tire problem.

In conclusion one may sum up briefly the following advantages which the past year has brought to the automobile man in the way of tires: superior materials, better workmanship, more advanced methods of working the raw materials, heavier and more dependable tubes, more efficient treads on shoes either plain or for the prevention of skidding, progress in demountable tires, undoubted advances in removable rims, and, best of all, lower prices to the owner and operator.

Ajax-Grieb Rubber Company, Trenton, N. J.—This manufacturer of Ajax tires has built up a reputation, and incidentally a business, or perhaps this should be stated inversely, as a result of meeting the up-to-date "show me" tendency face to face. This was done with the guarantee proposition, which was nothing more nor less than a written guarantee for 5,000 miles of service with every tire. This guarantee was made in the full expectation of making it good, and subsequent experience with the working out of it showed the astonishingly low percentage of 2 per cent replacements. In making a business-like guarantee of this sort it was to be expected that a tire was made that was fully capable of being guaranteed, so that the buyer gets the best of it both ways; in fact, it is hard to see how he can lose. This company is distributing to its friends souvenirs in the form of an indelible pencil, whose construction resembles the now-popular ink pencil very markedly. By pressing the small end of the pencil, the lead is allowed to drop out into place at the other end.

Batavia Rubber Company, Batavia, N. Y.—The new Seeurity tread used on Batavia pneumatic tires consists of two rows of depressions extending transversely on the tread from either side of a broad central tread part, which is left plain. These depressions are three-quarters of an

inch wide and one-quarter inch deep at the tread strip, and gradually decrease to zero at the outside of the tread portion.

Continental Caoutchouc Company, New York.—At this stand is exhibited Continental ready-flated tire and the demonntable rim with which these tires may be used. These tires and rims have caused no little talk and aroused any amount of interest in this solution of the tire problem. In favor of this combination it is stated that a change can be made as quickly as an ordinary tire can be inflated. Continental round tread or A C flat, guaranteed for 3,500 miles; flat-tread type course, 4,500 miles, and non-skid steel studded, 2,000 miles, are fitted on Continental demountable rims. Those desiring to equip their car with quick tire repair devices should examine these tires and rims. The carrying of tires already inflated on spare rims has done more to eliminate tire trouble and make motoring a pleasure than any other product now on the market. The complete equipment consists of the necessary rim bands and attaching devices for four wheels, also two spare rims on which tires are carried already inflated. When trouble is met with the damaged tire and its rim have only to be removed and the already inflated tire carried as a spare exchanged in its place, taking less time than to pump the tire by the ordinary method. Each equipment is guaranteed to the extent that if not perfectly satisfactory it will be replaced at no cost to the purchaser. If the mileage above mentioned is not obtained, adjustments are made on this basis.

Courtney Rubber Company, New York City.—A line of extra heavy flat tread and anti-skid tread tires are shown, as well as the inner tubes which go with these pneumatics. Considerable handwork enters into the manufacture of these tires. The Courtney anti-skid consists of a triple line of steel studs, the feature of which is that it is possible to re-tread the tires. The handwork on these tires should be worth considerable to a prospective purchaser, for the very fact of hand work being used shows that the company is anxious to make a good tire. Similarly the re-treading feature of the anti-skid shoe is one well worth considering, this being impossible with most shoes.

Dayton Rubber Manufacturing Company, Dayton, O.—The product of this company is known as the airless tire, and this name indicates the type and construction of the tire itself. It might be called a cross between a pneumatic and a solid tire, or, to be more exact, call it a cushion tire. The construction, which is that of a solid tire with internal air pockets or chambers separated by walls of very thick rubber, has been likened to a bridge, the walls forming the columns, the reinforcement on the inside between the walls to the heavy floor beams, and the tread to the flooring or roadway. The claims made for this form of tire are that no pumping is necessary as with pneumatics, nor are punctures or blowouts possible, that they will ride as easy as air-filled tires, will not crush under rated loads, are resilient and fast, will not eat up gasoline, nor deteriorate rapidly. To substantiate these claims only the best of Para rubber and Sea Island fabric are used, cured over a metal form in a single operation, and having the integrally cured walls proportioned to the rated load.

Diamond Rubber Co., Akron, O.—In the field of tiremakers the word Diamond stands out conspicuously as symbolical of all that the name implies. Time nor money have not been spared by the Diamond Rubber Company in working toward the end that what has been the constant source of annoyance and expense to the owner of an automobile, shall be materially improved each year. The tire man has been compelled to stand much hard criticism, and no one company is doing more than the Diamond to better this situation. For the coming season the product shows more than ever the advances in tiremaking, and it only needs the months of usage to prove the claims made for the new product. The owner, or the prospective owner, will do well in equipping his car for 1909 to make a thorough examination of the demountable rim designed especially for touring purposes, and the steel-studded casing as a non-skid is worthy of much commendatory criticism. Heretofore the light car owner has not given so much attention to the tire question because it has been his particular luck not to have much trouble.

Dow Tire Company, Boston, Mass.—Dow non-deflation tubes are shown. As is well known this non-deflation quality is secured by means of a flexible fabric which is incorporated in the walls of the tube. This fabric, consisting of a plastic compound made of feathers and especially prepared cement. In case of a puncture, a fibrous plug mechanically seals the hole. The tubes are, of course, especially shaped to receive this compound, the upper two-thirds of the tube being double, with a space between. It is in this space that the compound is carried. The tubes are adapted for use with any outer shoe, the

makers of it, in fact, do not make a shoe of any kind, specializing on the self-healing tubes. These weigh three times as much as the ordinary tube, but, while this sounds large, the actual additional weight is very little.

Empire Automobile Tire Company, Trenton, N. J.—These tires are made in four styles, the difference lying wholly in the tread. This is made in the old plain round tread; in a single cured Bailey tread; the favorite raised tread, which has a double thickness of rubber just in the center of the tread where the wear is greatest; and, lastly, a brand new non-skid studded tread. The latter is put on over the raised tread, and consists of a narrow band of double chrome leather with four rows of rivets through both thicknesses. The difference from most studded tires, however, lies in the rivets themselves, which have a case-hardened head for wear and a very soft, flat inner end. For Winter use and all-the-year-use on bad roads these will be the firm's leaders. In connection with their unusually heavy inner tube, this company is calling attention to the fact that very few tires are pumped up to the tire pressure which will give the proper service and is distributing tables of necessary pressures and of tire carrying capacities.

Ennis Rubber Manufacturing Company, Newark, N. J.—Although the Ennis tire has been on the market but one year, the company made an elaborate display in the Palace. It showed a line of motor car pneumatics, inner tubes, and motor cycle and bicycle tires, which it has just started in to manufacture. Although a newcomer, a vigorous and aggressive policy will be adopted and prospective buyers are assured of the loyal support of a large company, whose factory is equipped with modern machinery. More than this the oldest and best established firms cannot do.

Faultless Auto Tube Company, New York City.—This company exhibited its multi-inner tube tire in which instead of one there are four concentric inner tubes, all connected with the same valve. Ordinarily the outer tube is inflated, the three others remaining deflated within it.. Should this outer tube become punctured the next outer one is inflated, and so on until all four have become punctured. The valve is such that the air can be injected into whichever one of the four inner tubes is desired.

Firestone Tire and Rubber Co., Akron, O.—In its big exhibition on the gallery floor overlooking the central space below, the salient features of the Firestone exhibit are two in number, viz.: the demountable rim and the new non-skid tread. The demountable rim may be used in connection with clincher or quick detachable tires, and consists of three parts: channel rim, locking ring, and demountable portion containing the tire. It has no narrow wedge shapes and no sharp angles so that its parts cannot rust together and make the

rim difficult to manipulate. The non-skid tread is formed by the raised oblique lettering "Firestone Non-Skid" arranged in double rows across the tread surface of the tire. It presents a great number and variety of edges and points of road contact, thus securing better anti-skid properties. This exhibit includes the motor truck tire.

Fisk Rubber Company, Chicopee Falls, Mass.—Fostering the modern desire for quick-change tire devices, this company showed and demonstrated the removable rim fitted with the heavy-car type of bolted-on tire. This was shown and demonstrated to the exclusion of the other worthy types of tires made by this company, showing that this was looked upon as the best form for the average autoist. As demonstrated in the Glidden tour the change of a tire may be made in from a minute by an expert to less than three minutes by a novice, this change being a simple matter of taking off five nuts and a ring, then replacing the tire by a new one and putting the ring and nuts back on again. This concern also calls attention to the insufficient tire pressure usually used and asks to have Fisk 5-inch tires inflated to 90 pounds front and 100 pounds rear, with other sizes in proportion.

G. & J. Tire Company, Indianapolis, Ind.—The successful business man has been mindful of the demands of the public. This company, ever alert to the requirements which would be demanded by automobilists, has taken full recognition of these demands and produced to meet them a superior article in the tire line. This line of tires is made from the highest grade of rubber and fabric, with good workmanship and on outlines that are the most essential in pneumatic tire constructions. No radical departure in construction is made for 1909. There have been improvements in mechanical processes used in the construction of the tire which have resulted in added toughness to the rubber tread. The line as it is to be shown at the Palace consists of the Standard, Clincher, Dunlop, and quick detachable clincher, all of which are furnished in either the smooth or the Bailey tread. New in the line is the Indianapolis G. & J. motorcycle tire of molded construction, made in the shape it assumes under inflation. This tire is supplied with corrugated, basket, or Bailey treads. Another motorcycle tire feature is the butt end tube, which is known as the Indianapolis socket-joint motorcycle tube, the name being derived from the ball-and-socket manner in which the ends slip together. The feature of this tube is that it can be removed from the tube or replaced without removing the wheel from the frame.

B. F. Goodrich, Akron, O.—The wonderful increase in the factory capacity of this company bespeaks the merit of its product, the past eighteen months alone having tripled the capacity, to say nothing of previous large additions and one at present under construction. The principal feature of the exhibit at the Palace is the quick detachable tire, which is similar in construction to the regular clincher, but designed for easy application and removal without the necessity for any tools. This is accomplished by the use of detachable ring, provided with hooked ends which engage in slots in the rim. These hooked or locking ends can be released from position in remarkably short time, freeing the ring from the rim and leaving practically a flat surface for the tire to slide over. The ring is attached or locked to the rim just as easily and quickly as it is detached, the hooked ends engaging the rim slot almost automatically and in such a way that precludes any possibility of the ring working loose.

Goodyear Tire & Rubber Company, Akron, O.—After an unusually good year, the Goodyear people "bobbed up serenely" at the Palace show with the universal rim and the detachable tire. The latter is made with non-stretching piano wire tape in the base, which has got to break before the tire can be forced off. The rim made to be used in conjunction with this tire is demonstrated and a crowd keeps the demonstrator busy all day long putting the tire on and taking it off again. The famous racing driver, Barney Oldfield, makes use exclusively of these tires and rims on all of his racing machines, because of his high regard for them. The company is distributing a folder in which an extract from the Chicago *Record-Herald* gives an interesting account of Oldfield's own description of the sensations of record-breaking drives, in which incidentally he says a good word for this tire and rim.

Hartford Rubber Works Company, Hartford, Conn.—This concern offers for public inspection its line of tires and rims with which the public already is familiar. No additions to the line have been made, but the company is pointing with pride to its quick detachable rim, which is on exhibition. This is the rim approved by the mechanical branch of the A. L. A. M., which, by the way, is largely responsible for the form. It is adaptable to the standard clincher or the Dunlop tire by simply turning over the removable ring. In addition truck tires are shown, the only change being a minor one. This is the cutting away of the extreme corner of the base along a diagonal line, which results in a better holding device, and consequently a better cross compression. The tread is unchanged.

Healy Leather Tire Company, New York City.—Besides its well-known leather tire from which they take the name and which has attained considerable fame both here and abroad, this company shows its demountable wheel. This is very different from the ordinary run of demountables in that when removed the ends of the spokes are left bare and exposed. A tenon fits onto each spoke and an anchoring lock bolts to this and holds the rim firmly. Although there is thus a bolt for every spoke, a special bit is provided for taking them off, and it is claimed that the complete change can be made by unskilled operators in less than three minutes.

Irving Snell, Little Falls, N. Y.—This maker exhibits a resilient cushion tire with a non-skid tread. The tire is made up of several layers of rubber mounted upon the felloe in such a manner as to slide laterally a short distance. This cushioning effect is increased by a number of holes, which extend through the length of the rubber. V-shaped ridges on the circumference or tread serve as cleats, increasing the traction, and act to prevent skidding. Air may circulate through between the ridges, and for this reason the additional claim is made that they raise less dust than other solid or cushion tires.

Michelin Tire Company, Milltown, N. J.—A number of tire accessories are shown, including the newest Michelin valve spreader, which is a little device that makes the use of security bolts and lugs unnecessary with clincher shoes. Of course, these were incidental to the large line of both commercial and racing types of demountable rims, and the full line of tires, including plain, flat tread, and non-skid. On the racing rim the tire is carried by a split ring, the ends of which are united by a turnbuckle. To remove all that is necessary is to turn this turnbuckle enough to allow the ends of the rim to slip off.

Morgan & Wright, Detroit, Mich.—Two new tires and a quick detachable rim are shown. The new rim is operated by snapping or unsnapping a locking ring, the only tool required being a small screwdriver or a sharp-pointed file, which can be used as a pry. The security of the fastening is entirely independent of the inflation of the tire. A heavy flat tread tire mounted on the standing universal quick detachable rim is in addition to the line. It has extra breadth and thickness in the tread. In addition, a new motorcycle tire is featured. This has a fastening arrangement of the clincher type, not the usual G. & J. clincher however, and is made with both non-skid and plain treads. A line of heavy truck tires are also shown, these being of the double side-wire fastening type, the twin tires having four wires.

Motz Clincher Tire and Rubber Company, Akron, O.—Besides showing the regular line of cushion and truck tires, this exhibit has two new tires. One is known as the special Long-Distance Electric and the other the Motor Buggy tire. The special long-distance electric is made on the order of the cushion tires except that the concave tread is cut deeper and the tread is scalloped in order to increase traction and eliminate skidding. The openings on the sides of the tire are made more than twice as large as formerly, thus allowing a greater range of flexibility and increased resilience. The motor buggy tire is of a clincher type. The tire is held in the rim by steel cross-bars placed slantwise in the

base of the tire, the ends of the bars extending under the flanges of the rim. One of the great features of the tire is that it can be applied by anyone, and should any portion of the tire become injured, the injured part can be cut out and a new piece put in without disturbing the rest of the tire.

Pennsylvania Rubber Company, Jeannette, Pa.—This concern features its non-skid tires for winter or rough use and produces figures to prove these more economical than plain tires, these figures having been deduced from actual practice. These are a steel studded tire with a leather tread, in which the studs are imbedded. The studs are of case-hardened steel and are set in a special process leather strip which encircles the tire. This tough leather not only serves to hold the studs securely in place, preventing their being torn from the tread, but it also protects the tire and renders it practically puncture proof. In opposition to usual practice this company recommends that at least one front wheel be equipped with non-skids besides both the rears, particularly if the car is used on city streets with asphalt pavement.

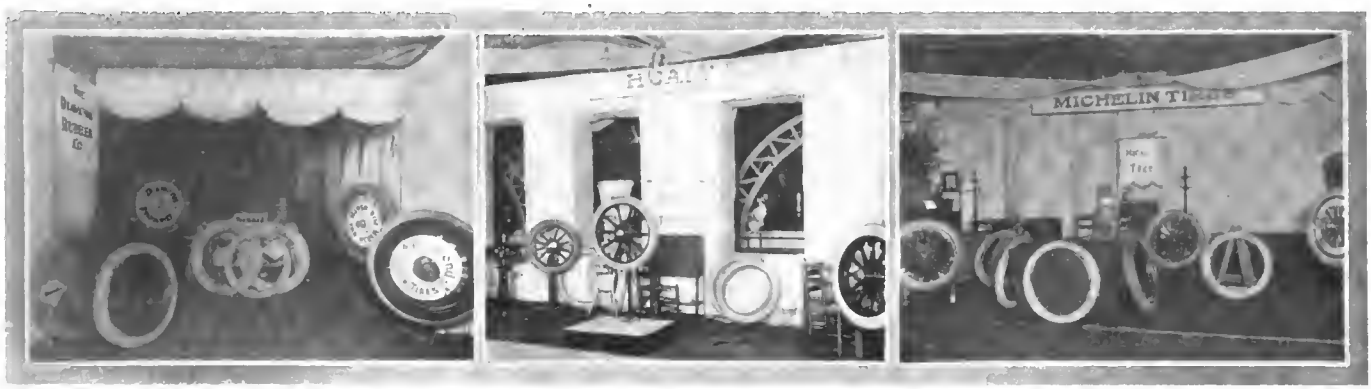
Pneu l'Electric Company, New York City.—This firm exhibits a full line of electric pneumatic tires, which are made in all of the standard metric sizes with either plain or other treads, as desired. In this age of specialization it is not strange to find a company thus making tires for one special branch of the industry. At any rate, the purchaser is assured of a product especially adapted to the work it has to do.

Republic Rubber Co., New York City.—One of the big interests for the people who attend seem to be the various non-skid devices. The Republic Company shows one that draws the crowd all right in the Staggard tread. This is a series of elongated projections, about two inches long and a half inch interval between. Six rows of these encircled the tread of the tire. Casings in this style may be had from 28 by 3 to 36 by 5, and in metric sizes from 910 by 90 to 935 by 135. In addition, the flat tread corrugated and plain clincher types are shown, the former having about seven small corrugations in the smaller sizes, and only two deep grooves in the 4½ and 5 sizes.

Samson Leather Tire Company, New York City.—This is the well-known leather tire protector which may be applied to any tire. It consists of a leather tire cover, having an extra leather tread, to which steel non-skidding studs are attached, and an additional leather strip to be placed between the protectors and the tire to protect the latter from the ends of the rivets. This strip and the cover should be vulcanized on the tire to get the best results.

Swinehart Clincher Tire and Rubber Company, Akron, O.—Featured at this stand is the Swinehart rim attachment which permits of the fitting of Swinehart cushion tires without disturbing the original rim equipment or changing the road appearance of the car. It is possible, with this attachment, to use one or more cushion tires in connection with the pneumatics on the same car. In making the attachment, eight bolts come into play, which are placed on top of the rim and on the wheel, after which the tire rims are thrown into position. The bolts are then easily slipped around in proper position and tightened with a wrench, which securely clamps the rim and tire to the wheel. This attachment permits of it being utilized as a spare wheel.

A full line of these solid tires is shown in the sizes varying from the smallest and lightest adapted to delivery wagons and similar cars up to the big heavy twin tires for the heaviest loads, one ten-ton truck photograph being displayed. These latter are called demountable and detachable, because of the construction of the rims, which allow both features, the average time for demounting being less than twenty minutes.



TIRE ACCESSORIES.

Allen Auto Specialty Company, New York City.—At this exhibit is displayed a line of tire holders and tire covers. The latter are of fabric and completely encircle the spare tire carried, while the former are metal tire iron for fastening these covers with the enclosed tire to the car. The tire holders are made large enough for tires with demountable rims, spare wheels, or anything in the wheel or tire line, either with or without attached rims.

Auto Improvement Company, New York City.—This concern exhibited a new demountable rim in which the clincher rim on the tire can be utilized in the demountable. On the wheel felloe is attached a thick metal rim with four cross-slots cut in it, each approximately one-quarter inch deep, and varying from one and one-half inch wide at the inner side of the rim to nearly two inches at the outer side. Into each of these slots fits a cross steel piece, formed clincher style, and riveted to the inner side of the clincher rim carrying the tire. In one side of this is a semi-circular recess, into which a locking cam carried in the wheel felloe enters. This cam is mounted eccentrically on the outer end of a radial bolt passing through the wheel felloe, and which can be locked in position by the nut on the inner end of the bolt. In removing the rim the four cams have to be oscillated back out of the recesses in the clincher rim cross pieces, after which the rim can be pulled off.

Auto Tire Inflating Company, New York City.—A feature of this inflating bottle for tires is the regulating valve in which a brass cup with an end of hard rubber guards the small exit for the inflating gas. This cap or valve is held seated through a stiff steel coil spring, on top of which is a small cap, on which bears the controlling screw. The use of a hard rubber valve and a spring medium between the valve and adjusting screw is to avoid destruction of the valve seat, and to eliminate any cringing that might otherwise occur.

Brown Company, Syracuse, N. Y.—In these days when the average motorist realizes the importance of keeping his tires pumped hard the necessity for having a positive method of accurately determining the pounds inflation is apparent. Figuring this way, the Brown Company is introducing for the first time a tire pressure indicator which is simple in operation. To determine the tire pressure this device is screwed on the valve stem of the tire and by the contact of the valve plunger with a similar device in the post of the indicator the air is allowed to pass into the gauge. At the same time, the pump can be applied to the other end of the indicator, and every pound forced into this registers itself on the gauge.

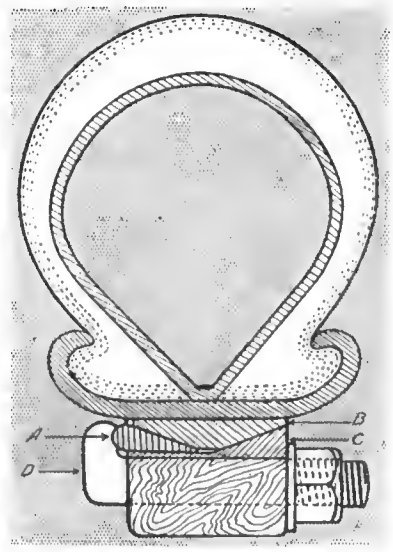
Garage Equipment Co., Milwaukee, Wis.—In the way of anti-skid devices, the Garage Equipment Co. calls attention to its emergency mud hooks, which are made in two styles, one for pneumatics and the other for solids. These mud hooks, as the name indicates, are for use on roads where the mud is deep or there is lots of sand. One hook goes on each wheel, and there is a projecting flange which digs into the dirt and gives it the desired traction. These hooks are made of malleable iron, weight five pounds per set, and will fit any tire from 3½ to 6 inches. Usually the projecting lug is two inches, but where the clearance between the fender and the tire is not enough to accommodate a large lug, a one-inch lug is provided. The mud hook designed for use on solid tires has a lug which projects only three-sixteenths of an inch beyond the tire. From four to six on each wheel are recommended when solid tires are used.

Gilbert Mfg. Co., New Haven, Conn.—One of the new Gilbert tire cases is of the buttoned or glove fastener type, with waterproofing flap, in which the glove fasteners are on the side of the case instead of on the inner face. The weather proofing flap is a semicircular flap dropping over the upper half of the joint only, the cover on the lower half overlapping as shingles on a roof and eliminating the necessity of the flap. Other new parts for this year by this company are pocket tool case to fit the hip pocket, gas tank key, single and dual tire clamps for running boards and magneto covers.

Newmastic Tire Company, New York City.—This firm does not make, so does not show, a tire, but rather a tire-filling compound which has been on the market for several years. An improvement has been made in the past year, however, by increasing the glue contents of this mixture to 10 per cent. and a similar increase in the glycerine, with the result that more resiliency is obtained. The compound is not as heavy as would be supposed, a 36 by 4 tire when filled weighing but 35 pounds.

C. A. Shaler, Waupun, Wis.—All who have had experience with pneumatic tires realize that anything which tends to keep them in good condition will prolong their life to a marked degree. One of the greatest foes of tires are the sharp stones, etc., which cut holes in the casings regardless of the quality of the tire, and make disastrous blowouts possible. The vulcanizer designed especially for autoists by C. A. Shaler is of such merit that many disagreeable moments can easily be avoided by its use. It is the work of only a few spare minutes to take a look at the tires, and by the use of this appliance heal up all wounds to the casings so effectively that it would be hard to find where the hole had been. In the matter of patches it is equally good, and the work of only fifteen minutes to put the tube in condition.

J. H. Sager Company, Rochester, N. Y.—This firm has been aiming at producing a demountable rim both simple and strong which can be quickly detached or attached by even the novice. The rim which is shown at the show for the first time covers these points and will undoubtedly prove a valuable asset in the matter of quick and comparatively easy tire repairs. Any ordinary clincher rim is used, and the tire with its rim is reversible; that is, it may be put on either way as the beveled surfaces (B) are the same. A band (C) having one beveled surface extending inward is shrunk and otherwise secured to the felloe of the wheel, and the only loose part is the beveled ring (A). The hook bolts do not have to be removed, but simply loosened, when they will easily turn down out of the way. The ring (A)



Section Sager Demountable Rim.

will take up any wear which might occur, and as it is split in one place, it immediately loosens up when the tension is taken off the bolt hooks, allowing the rim to slip away easily.

Seamless Rubber Company, New Haven, Conn.—The value of good inner tubes is not easily estimated, and having been actively engaged in the manufacture of rubber goods for nearly a third of a century, this concern enters the automobile world with a supply of inner tubes, gloves, patches, etc., in which are incorporated many ideas that have proved successful for years. The tubes are supplied for any standard make of casings.

Standard Leather Washer Mfg. Co., Newark, N. J.—This exhibit consists of leather tire bands of various kinds and the new Maison Gris tire pump. The tire pump is built to produce 100 pounds pressure in the tire without much labor. The Blanco band consists of a strip of rawhide tanned by a special process. It is 5-32 inch thick and is claimed to be free from grease and oil usually associated with rawhide. The Everwear tire band is a strip of four ply extra heavy woven canvas 1-8 inch thick, to which is cemented with waterproof cement a layer of mechanical mineral tanned leather. The band is then studded with hard steel rivets. The finished band is 3-16 inch thick over all. The studs projecting about 1-8 inch and fitted with heavy brass eyelets and slotted to permit close adjustment to the shoe.

Travers Blowout Patch Company, New York City.—This is a quick repair device, consisting of a patch made of a rubber and fabric combination which fits inside the shoe of the damaged tire and has flanges on each side which fit between the tire shoe and the rim. A friction surface on the patch prevents it from creeping around out of place. This is a very neat, quickly applied, and, therefore, very useful, besides taking up small space in the tool kit.

Weed Chain Tire Grip Co., New York City.—The necessity for providing automobile tires with some means to prevent slipping in times of rain, ice, or snow is universally recognized, and the presence of a set of Weed chains under the seat has many times saved the day. In the cities, where asphalt becomes really dangerous after the slightest wetting, some means to prevent skidding is an absolute requirement. Weed chains do the trick, and the cost of the chains is small indeed in comparison with the cost of possible accidents, to say nothing of the fact that it is "insurance" to have Weed chains in the kit.

The Leather Tire Goods Company, Upper Newton Falls, Mass., besides a full line of Woodworth adjustable treads, special and self-adjusting, show the "Kant-Skid," a series of small studded strips of leather encircling the tire and joined together around the inside and outside by a series of steel rings. These and the ends of the strips have an ingenious fastening device, which allows the removal or insertion of any strip or ring without disturbing the others. This consists of a pair of what are called "sister hooks," which are two hooks turned opposite ways and held close together by the natural spring in the steel wire. To remove or insert another ring, slip it between the two sisters and turn through 90 degrees when each hook will slip through the hole, but in opposite directions.

York Auto Wheel Co., York, Pa.—The device to be exhibited by this concern is styled a resilient wheel, but it comes in the demountable class. The tire inflated is fastened to an iron rim which is split and which has a turnbuckle arrangement in it. On the turnbuckle is a right and left-hand screw, by turning which the rim can be expanded enough to allow the flange on the inside of the rim to seat itself. To protect any possible weakness at this point the inventor runs a steel brace around the entire circumference of one side of the wheel. On the other there is a small section of steel which clamps into the opening where the turnbuckle is located.

IGNITION EXHIBITS AT THE GRAND CENTRAL PALACE

By G. H. GODLEY.

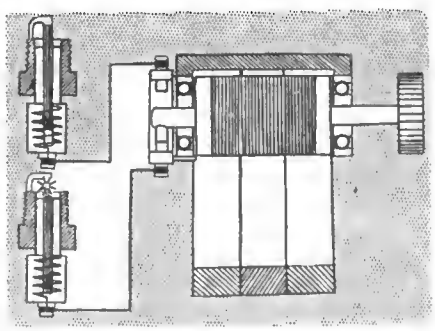
ANY description of ignition accessories must of necessity begin with the magneto, for the almost universal adoption of this device is one of the noteworthy features of the show. Last year the specifications read "fitted for magneto" or "magneto extra." This year in most cases the magneto is taken for granted, and forms an integral part of the motor. However, there still remains much diversity of opinion as to the best system, and as to the desirability of an auxiliary battery. The low-tension make-and-break still holds its own on a few of the old guard, notably Premier, Gaeth and the larger Fiat models, and may receive a new lease of life from the invention of magnetic plugs, as used on the Mercedes.

Numerically the high-tension users are far in the lead. These in turn are divided between the high-tension, properly so-called, and the low-tension jump spark with separate coil. The former, in which the armature carries both primary and secondary windings, is entirely self contained and permits a simpler wiring system; usually there is but one secondary cable to each spark plug, and a primary wire to the switch. The separate coil system, on the other hand, is probably simpler in actual construction, and may more easily be fitted with an auxiliary battery, when this is desired. In short, both types have their advantages and disadvantages, and the choice between them must in most cases rest simply on the excellence of design and workmanship. There may be seen, however, several interesting attempts to compromise between the two types, with the view of securing the best possible combination of the necessary elements.

The present popularity of magneto ignition is one of the best possible proofs of the generally excellent quality of the different machines. When they were first introduced the public had little confidence in them, and they were usually regarded as adapted only to cars that could have the constant attendance of an expert electrician. A complete battery system was always demanded in addition, separate even to the spark plugs. Although some automobile manufacturers still use the two entirely separate systems, this seems only a desire to give the customer his money's worth, rather than a sign of distrust of the magneto This increased confidence is certainly warranted by the advances made in magneto construction. Noticeable improvements are the innumerable slight changes in the arrangement of the terminals, the heavier insulation, special alloys at the contact points and stronger and more permanent magnets.

J. S. Bretz Company, New York City.—The U. & H. magneto shown by this company is another example of the true high-tension type. The magneto itself follows standard designs, with such refinements as the makers have found desirable; its remarkable feature is the starting device, which does away with the rapid spinning of the crank often necessary to secure a spark. When the driving pinion of the magneto is rotated at a low speed the armature and timing devices at first remain stationary, and instead the driving force is utilized to wind up a coil spring. At the desired point the spring is tripped into action, and rotates the armature through the field of the magnets with a quick jerk, thus securing the maximum spark. As the speed increases the device is thrown out of action and the drive becomes direct and constant. A more detailed description of this device, with illustrations, appeared in a recent issue of THE AUTOMOBILE.

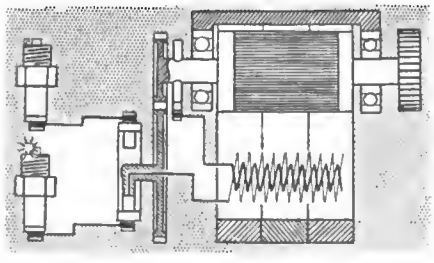
Bosch Magneto Company, New York City.—This company shows a very complete line of all types, but unquestionably the feature of their exhibit is the new magnetic make-and-break spark plug, on the Honold system. The magneto used with this system is a low-tension type with a primary timer sending the current to each plug in turn. The passage of the current through a small coil in the body of the plug forms a magnetic field which attracts the movable electrode of the make-and-break device, causing it to spring away from the stationary electrode and break the circuit. A hot low-tension spark immediately leaps between them. The wiring consists of a primary connection to each plug and one to the switch—not quite as simple, it is true, as the single wire and bus-bar of the usual make-and-break system; but it has the great advantage that no moving parts must pass through the cylinder wall, and there are no cams or tappets required on the motor. In addition to this specialty the exhibit comprises the standard low-tension make-and-break and high-tension types familiar to the industry. The Bosch jump spark magnetos are all of the true high-tension type, with double armature windings, and may be had to run at either camshaft or crankshaft speed. There is also shown a compact coil and switch to be used.



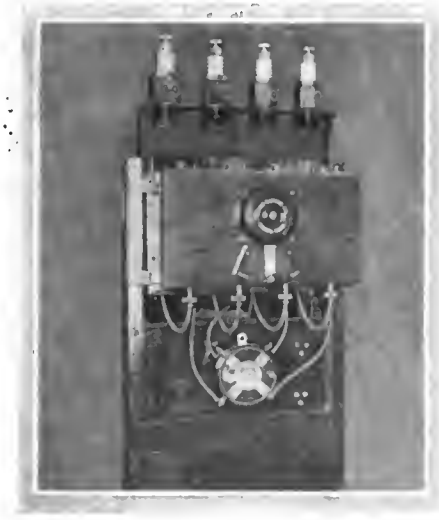
Sectional Plan Bosch Magneto.

Herz & Company, New York City.—The Herz magneto, according to the makers, is an attempt to secure as close an approach as possible to ideal efficiency, and with this end in view they have embodied a number of interesting features. The magnet system consists of several flat, round steel plates clamped together to form a cylindrical body, through which is then bored the "tunnel" for the armature. There are no separate pole pieces, and thus no breaks or joints in the magnetic circuit. This idea is carried still farther by finishing the "tunnel" and the armature itself with such accuracy that they move within four one-thousandths of an inch of one another in perfect freedom. The armature carries both primary and secondary windings, with the condenser arranged in a cylindrical case on one end, and the contact-breaker, which forms a separate unit, just beyond. The single-cylinder magneto weighs but 4¼ pounds and the four-cylinder machine 8 pounds.

Hess-Bright Manufacturing Company, Philadelphia, Pa.—One of the most ingenious attempts to combine the advantages of the high-tension and low-tension jump spark mangetos may be seen in the Hess-Bright machine, recently brought out by the well-known manufacturers of ball bearings. Strictly, this mangeto belongs to the low-tension group, but its appearance by no means indicates this fact. The armature carries a single primary winding, but the coil, instead of being housed in a separate case on the dash, is made very small and compact and inserted in the arch of the magnets, directly above the armature. This eliminates at one stroke all external primary connections, and gives the system the neatness and compactness of the true high-tension. Another feature is the method of advancing and retarding the spark. The armature is connected to the driving shaft through a spirally grooved sleeve, which may be slid back and forth to set the armature either ahead of or behind its drive. The contract-breaker and distributor of course move with the armature. In this way a change of as much as 60 degrees may be obtained with no variation in the current induced. The condenser is unusually large, and the armature shaft runs on H-B bearings specially designed for magneto use, in which an attempt is made to afford the maximum simplicity, coupled with the longevity of the regular types of H-B ball bearings.



Section Hess-Bright Magneto.



Heinze Spark Coil Exhibit.

Heinze Electric Company, Lowell, Mass.—To its line of spark coils and other ignition apparatus this company has recently added a magneto. This device, unlike the majority of magnetos exhibited, makes no attempt to concentrate in itself a complete ignition system, but simply takes the place of a battery. It generates a low-tension current and operates through the usual timer and vibrating spark coils. The magneto is small and compact, being in the shape of a cylinder with the driving pinion on the axis at one end, and the terminals at the other. It sells at an unusually low price.

Lavalette & Company, New York City.—Prominent among the types which make use of an entirely separate coil is the Eisemann-Lavalette, a French device which is included as standard equipment on a number of both foreign and American cars. The coil box may be mounted on either the front or rear side of the dash, according to the preference of the user. The advantage claimed for this construction is that, there being no especial limitation on the space occupied by the coil, the insulation may be made very heavy, thus minimizing the danger of a short circuit. The auxiliary battery is regularly included with this type, so that the motor may be started on the spark whenever this would have been possible with the old battery system alone. The battery may be connected in two different ways, forming more or less a separate system; it may either use the timer and coil of the magneto, or be provided with a separate coil and timer, in both cases using the magneto distributor and the same set of spark plugs.

Pittsfield Spark Coil Company, Dalton-Mass.—The Pittsfield magneto makes a wide departure from usual designs and is rather difficult to classify, but it seems to have more of the characteristics of the true high-tension type. The armature consists of a simple laminated inductor, with no winding whatever. What would otherwise be a double armature winding, both primary and secondary, is placed to the rear of the inductor and remains stationary. It is carried by two steel bars projecting horizontally from the poles of the magnets, and its core is included in the magnetic circuit. This winding or coil forms a separate unit and may be easily removed upon taking off the back cover of the machine. The circuit-breaker is mounted between the armature and the stationary coil. There are four pole pieces instead of two, these being arranged in the form of a sleeve about the armature. As a result the magneto gives four impulses of current to each revolution, and must be driven at camshaft speed. This makes it possible to mount the distributor directly on the front end of the armature shaft, dispensing with the usual secondary shaft and half-time gears. Timing is effected by shifting the pole pieces.

Remy Electric Company, Anderson, Ind.—Remy is an adherent of the standard low-tension type with separate coil. However, an interesting change in the construction of the magneto itself may be noted. The winding of the armature is stationary and imbedded in the pole pieces of the magnets, and the rotating part or inductor is a simple forging mounted on the driving shaft. This does away with moving contacts in the primary circuit—a frequent source of trouble. It is claimed that the wave outline of the current shows a very abrupt rise and fall, with an almost flat top, permitting a considerable change in timing at the same strength of current. The auxiliary battery system which is regularly used acts through the magneto timer, coil and distributor. The coil, which is carried in a neat box on the dash, also contains the switch and a push button for starting on the spark.

C. F. Splitdorf & Company, 1679 Broadway, New York City.—After an unsuccessful experiment with the high-tension magneto, the Splitdorf company turned to the separate coil type, and are showing a complete line of these machines in addition to their well-known spark coils, plugs and timers. Their magneto is adapted for the use of an auxiliary battery, but this is not needed except for starting on the spark, as the magneto itself gives a sure spark at speeds as low as 40 r.p.m. To demonstrate this, their exhibit included a magneto fitted with a crank that could be turned by hand, connected to a set of spark plugs; a very slow turn of the crank was sufficient to produce vigorous sparks.

Wheeler & Schebler, Indianapolis, Ind.—The Wheeler & Schebler magneto is intended simply to take the place of the battery, and acts through the usual separate timer, and vibrating coils, or a single coil and distributor may be used. Its rotation need not be synchronous with that of the motor, so that it may be driven either by gear, friction or belt. The speed is about three times that of the motor. Unlike most machines of this type, it requires no gov-

ernor. Among the advantages claimed are the absence of wound rotators and the mounting of the shaft on annular ball bearings, the importance of which cannot be overestimated, in view of the location.

Witherbee Igniter Company, New York City.—The Volta magneto marketed by this company belongs to the high-tension type and is entirely self-contained. The armature is of the standard H-section, of gray iron, and revolves between two pole pieces of the same metal attached to the magnets. The windings are carefully arranged and insulated to prevent short-circuiting, which is an important matter.

THOSE WHO WERE EXHIBITING BATTERIES

THE sudden wave of popularity of the magneto does not appear to have injured the business of the battery makers to any extent, but rather has stimulated them to make every possible improvement and secure every advantage which the battery possesses over its rival. In numbers the storage battery has the advantage, but the dry cell has received a considerable impulse through recent improvements in timer and coil construction, reducing the consumption of current. Most of the storage batteries exhibited show that the maker has taken unusual care to prevent creeping of the electrolyte and corrosion of the terminals, with the gratifying result that this branch of the ignition field will be better taken care of than ever.

Electric Storage Battery Company, Philadelphia, Pa.—This company's "Exide" storage battery for ignition purposes was first placed on the market in 1903, and is thus one of the pioneers in this line. Improvements for 1909 include a new terminal post designed to prevent creeping of the electrolyte, the reinforcement of the plates at the points where they rest on the ribs at the bottom of the jars, and the thickening of the separators. But perhaps the most welcome innovation will be the "duplex" model, which contains, in addition to the three standard cells, three small ones to act as a reserve. The principle is like that of the reserve supply gasoline tank. The additional cells increase the size of the battery case but little, and have a capacity of about five amperes, amply enough in case of accident to take the car to the nearest charging station.

Federal Manufacturing Company, Lowell, Mass.—One of the features of the Rex storage battery manufactured by this company is the "triple armored" casing, which consists of a quartered oak box on the outside, next a lining of shock-absorbing, acid-proof material and finally the hard rubber jar, the whole cemented together. No brass or iron screws or bolts are used, so that there is nothing to be corroded by the acid. Each cell is enclosed by an individual cover.

Geiszler Brothers, New York City.—The Geiszler product is known as the "non-sulphating" storage battery, as the makers claim that by a special chemical treatment of the active material this trouble is absolutely precluded. No injury results from leaving the batteries discharged or without recharging for any length of time. The separate compartments are sealed by an inner hard rubber cover and a thick layer of cement, insuring both acid and water-tight construction. Corrosion has been eliminated by silver-plating the screws of the terminal binding posts.

General Storage Battery Company, Boonton, N. J.—It is claimed that the grids of the Bijur storage battery, manufactured by this concern, are 40 per cent. lead and 60 per cent. active material. The positives are made twice as thick as the negatives, and the mud space is of double the usual capacity. The battery is fitted with a master cover which conceals all the metal parts, leaving none exposed.

Marko Storage Battery Company, Brooklyn, N. Y.—The grids of the Marko batteries are treated by a special process which is claimed to prevent shedding and disintegration; they are also made extra strong to avoid buckling. The battery is provided with a master cover which conceals all interior connections, only the main terminals and the vents projecting.

National Battery Company, Buffalo, N. Y.—Although most of this company's product consists of large batteries for electric vehicles, they have brought out a specially designed battery of suitable size and construction for ignition purposes. The positive grids are strengthened by solid vertical and horizontal cross-bars; the negatives are designed to allow for shrinkage, so that when this takes place the active material is drawn more closely around the projections on its surface, with the extensive experience gained in storage battery work.

Westchester Appliance Company, New York City.—The dry batteries manufactured by this concern are especially designed for automobile ignition. Long life and great recuperative power are obtained by the use of only the best materials. The electrolyte is so balanced that there is no possibility of short circuit or polarization.

Witherbee Ignitor Company, New York City.—This company exhibits its well known storage batteries with the "busy bee" trade mark. The former models are retained practically without change, but a new "Witherbee Jr." battery has also been brought out in response to the demand for a high-class battery at a lower price. The wood case is in bog oak and the metal parts are finished in black acid-proof lacquer.

IN THE LINE OF TIMERS AND COILS.

AS nearly all companies that make timers or coils make both, these two components naturally group themselves together. The coil makers have often said that they were forced to make timers in self-protection, on account of the uneconomical operation of the original designs. Whatever truth there may be in this assertion, it is undoubtedly to the advantage of the industry that the same company should manufacture all the necessary accessories in any given line, so that these may be designed to act in harmony with each other and form a homogeneous system. The most noticeable improvement in timer construction is in the greater solidity and stability of the new devices. Ball bearings are used in many cases, and a firm support is always provided. In the line of coils, the unit construction is now universal, although this may be changed by the recent announcement of a basic patent on this design. This is a question that cannot be settled with any degree of certainty until the attitude of the makers is known. As to what they will do, and when, is a matter that will have to bide its time.

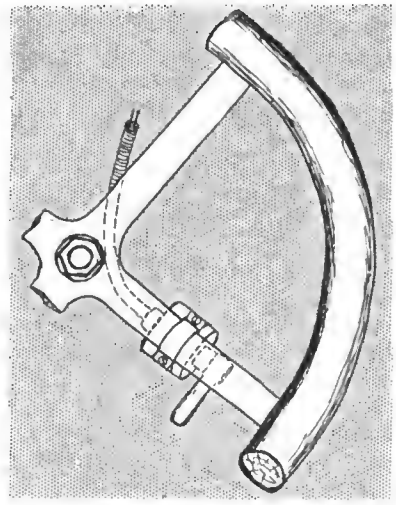
Atwater-Kent Manufacturing Works, Philadelphia, Pa.—The Atwater-Kent "spark generator" is unique in that it combines in itself timer, coil and distributor. It is one of the few devices operated exclusively by battery current that seem to be able to resist the advance of the magneto. The design is such as to obtain the highest possible efficiency and economy in current consumption, so that the ignition of a four-cylinder car may be effected by a single set of dry batteries. But one spark is produced for the ignition of each cylinder, and the duration of the contact is as short as possible. In this way it is claimed that a mileage of 1,500 to 2,000 miles can be obtained on six dry cells.

The Autocoil Company, Jersey City, N. J.—The Autocoil Company shows their new battery-saving timer, which is claimed to double the life of a set of batteries. The length of contact usually found necessary to insure firing under all conditions is about 45 degrees, and most timers are designed on this basis. For ordinary touring, however, this company believes that 15 degrees of contact is sufficient. Accordingly the Autocoil timers are made for 15 degrees contact in normal position, but by means of a foot lever the contact can be increased to 45 degrees for high-speed work. This end is attained by the use of a second set of contact plungers—a feature which in itself would secure additional certainty of firing. Autocoil spark coils are listed in the usual models, with or without kick switch and ammeter.

Connecticut Telephone and Electric Company, Meriden, Conn.—This company exhibits its standard line of coils, for which great economy of current consumption is claimed. It has also brought out a timer, of the roller type, in which the shaft runs on a double row of balls, one on each side of the roller arm. Special swivelling connections are fitted. Another addition to the line is a high-tension distributor and a coil specially designed for use in connection with it.

Federal Manufacturing Company, Lowell, Mass.—The feature of the Federal spark coils is the "torsional" vibrator, which, it is said, enables the coil to work on one-tenth of an ampere. The vibrator points are of iridio-platinum, much harder than pure platinum. The unit coil cases are of hard rubber instead of wood, so that they cannot swell or warp and are practically indestructible. The secondary coils are wound in layers with insulation between each layer, obviating any possibility of leakage. The vibrator cannot be thrown out of its working range by any possible misadjustment.

Heinze Electric Company, Lowell, Mass.—The standard models of Heinze coils may be seen at this exhibit, and also the latest type of timer. This has a wipe contact, secured by a steel arm passing over the upper surface of a fiber disk, from which project the heads of hardened steel screws connected to the binding posts. Their coil is provided with a new type of kick switch, actuated by a projecting lever of sufficient size to be easily thrown over by the driver's foot.



Connecticut Steering Wheel Switch.

Herz & Company, New York City.—This company holds the agency for two well-known French coils, the Gianoli and the Guenet. They still make the familiar snap-off and "tangent" timers and their high-tension distributor, in which all contacts are between hardened tool steel, with shafts running on ball bearings. The distributor is provided with swivelling ball-joint terminals for all high-tension wires.

Kokomo Electric Company, Kokomo, Ind.—The Kokomo Electric Company manufactures the Kingston line of ignition specialties, among which is a new coil with the terminals on the back side. The terminal posts are extended sufficiently to be flush with the front side of the dash. In this position they are unaffected by dirt or moisture, and a considerable amount of cable is saved. The company also makes a neat and compact roller-contact timer.

Monitor Manufacturing Company, Boston, Mass.—Bemus timers and Monitor distributors are shown at this exhibit. The former device retains its ball contact pieces, but for the ball center contact of former models a conical roller has been substituted. As this roller touches in turn the outer ball contacts, these are rotated in all directions, and whatever wear may take place is thus equalized. A special ground connection from the roller is provided, so that the current does not have to pass through a bearing of more or less resistance. The shaft, of course, runs on ball bearings.

National Coil Company, Lansing, Mich.—After a considerable period of experimenting this company has perfected a master vibrator system for multi-cylinder motors, which is said to be very simple in its adjustments and connections, and to greatly improve the running of the motor. The system consists of a single vibrator mounted on the dash, and a transforming coil for each cylinder made in unit form, preferably located near the cylinders. In all coils the insulating is of the highest grade, no paraffine being used, and the condenser capacity is very large.

Witherbee Igniter Company, New York City.—Another member of the very complete "Wico" line of ignition specialties is the spark coil. This has been designed especially to conform with the batteries, timers and plugs of this company. The timer is of the roller type, but instead of the roller touching the contacts directly, it runs in a loose steel ring. The contacts are of tool steel and project slightly, but recede as the ring passes over them. Thus a smooth path is provided for the roller, and the timer operates at all speeds without noise or wear.

PLUGS, SWITCHES, SUPPLIES.

Bosch Magneto Company, New York City.—This company has brought out a spark plug especially designed to work with their magneto. It can be provided with one, two or four electrodes, according to the work for which it is to be used.

J. H. Bunnell & Co., New York City.—There are always times when the dry cell proves its value as an emergency standby, and while it has been supplanted to a considerable extent by other forms of ignition, the number of cars which still use dry cells as their regular equipment for this essential is large, and, strange as it may seem, is increasing rather than diminishing, due to improved forms of timers and coils, which do not waste such a great proportion of the current. This company markets a dry cell that has been especially developed for auto use, and manufactures it in a square form, which increases the capacity of the cell without requiring additional room, and also facilitates carrying it, as it is proof against rattling round in the battery box.

Connecticut Telephone and Electric Company, Meriden, Conn.—One of the neatest little devices at the show is this company's new steering wheel switch. The switch contacts are contained in a compact box about 1 1-2 inches in diameter and 1 inch thick, which is clamped to the under side of one of the spokes of the steering wheel. It is operated by a lever arm which projects in such a way that the driver can reach it with his thumb without taking his hand from the wheel. The connections are carried through a flexible metal tube running down the steering column.

Herz & Company, New York City.—The "Bougie Mercedes" plugs of this company are familiar to all automobile users. They are still made with their double insulation of unbreakable stone, and are especially recommended for use with high-tension magnetos. The Herz foot switch and a complete line of terminals of all varieties are also shown.

Kokomo Electric Company, Kokomo, Ind.—The insulation of the Kingston plug shown by this company is built up of mica with a special fireproof cement under high pressure and then baked. They are made in 1-2-inch standard and A. L. A. M. sizes only.

C. A. Mezger, New York City.—The Mezger soot-proof spark plug has a deep annular space between the body of the plug and the insulation, and between the insulation and the central electrode. In this way an extremely long insulating surface is formed.

A. R. Mosler & Company, New York City.—The distinguishing feature of the Mosler plugs is the deep chamber in the base, which on the compression stroke is filled with the mixture. When the spark comes, this mixture is fired first, and rushes out through the narrow opening of the chamber with considerable force, so that the plug may be said to "spit fire." There is also exhibited at this stand a signal called the "Ist," to be carried on the tail lamp for night driving. By means of a lever on the steering column the driver can cause the signals "slow" and "stop" to appear for the benefit of any vehicle behind him.

National Coil Company, Detroit, Mich.—This exhibit includes a plug made for use with the National coils, which is distinguished by its four sparking points. These consist of triangular extensions of the body of the plug bent inward toward the central electrode.

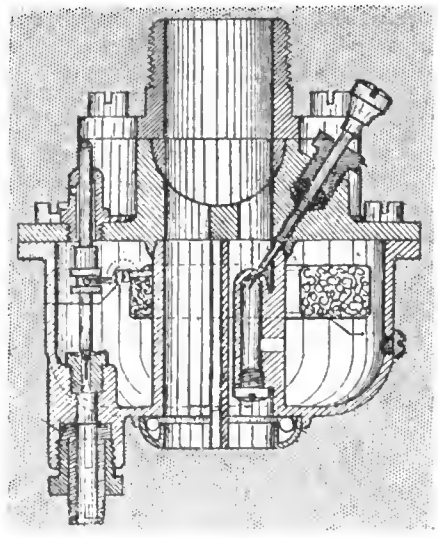
Stanley & Patterson, New York City.—This concern shows battery boxes made to hold various numbers and combinations of dry cells, the feature of which is that all connections are made automatically by the mere insertion of the cell into a socket in the box. All the boxes are strictly waterproof.

Witherbee Igniter Co., New York City.—The Wico spark plug is distinguished by its micrometer adjustment, by means of which the distance between the central electrode and the sparking points—here five in number—may be regulated to the thousandths of an inch. Another plug is also shown without this feature, at a somewhat lower price. The adjustable spark plug should find favor at the hands of autoists, in view of the ease with which it may be adjusted.

IN THE IMPORTANT FIELD OF THE CARBURETER

Albert E. Otto, New York City.—A novelty was shown in the imported Economy carbureter, manufactured by Adolf Saurer, of Switzerland, which has two spraying nozzles located side by side, the tip of one extending into a strangling tube of one diameter and the other extending into a tube of much larger diameter. The larger tube is normally closed at its upper end by a hinged flap valve held closed by dashpot and spring contrivance outside of the carbureter casing, so that until the suction of the motor reaches a certain limit, all of the mixture used passes by way of the small strangling tube, but above that the flap door opens and both tubes and both nozzles furnish the supply. In other respects the carbureter is a conventional construction.

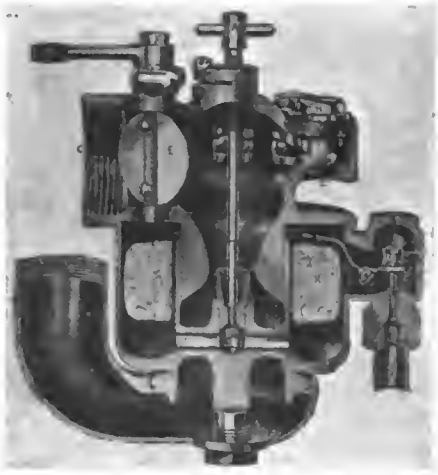
Allen Fire Department Supply Company, Providence.—This concern showed a two-port carbureter, the leading characteristic of which is that the vertical central air opening within the ring float is divided into halves by a vertical partition, and the spraying nozzle is located in one of the passages, and the other serves solely as an air entrance. The top of each passage is guarded by a sliding horizontal throttle having a circular opening equal in diameter to the combined area of the mixture and air passages. In this throttle also is an adjustable minimum air opening which prevents, if desired, shutting the motor off entirely when the normal throttle opening is completely closed. The needle valve regulating the gasoline entrance is operated by lever from the float. The only two adjustable parts about the carbureter are the minimum air passage controlled by screw and the needle valve in the spraying nozzle. Trouble of any sort is aborted by absence of loose parts.



Allen Two-Port Carbureter.

F. E. Bowers Company, New Haven, Conn.—The Bowers concentric-float carbureter has been improved by the addition of a peculiar type of auxiliary air valve in the form of three openings each guarded by a leaf spring, the suction having to overcome these springs before additional air enters. The air for these openings is taken through ports in the sides of an expansion of the mixing chamber, whereas the main air passage is a vertical one past the nozzle.

Breeze Carbureter Company, Newark, N. J.—The improvement in the Breeze carbureter is the control of the needle valve in the spraying nozzle, whereby with every opening or closing of the throttle there is a corresponding opening or closing of the needle valve, thus varying the gasoline flow in proportion with the amount of mixture required. This is accomplished by a cross track placed as a diameter of the vertical cylindrical throttle. The track is supported at one end by a high-speed adjusting button, and at the other end by a low-speed adjusting button. On the needle valve stem is a wheel which rides on this track and through which the throttle changes are transmitted to the needle valve. By means of the external high and low-speed adjusting buttons all carbureter adjustments can be quickly made from the outside.



Section View Kingston Carbureter.

Byrne, Kingston & Company, Kokomo, Ind.—The new Kingston carbureter differs from previous types, in that the auxiliary air valve takes the form of five air openings, each guarded by a metal ball which must be lifted from the seating in the air port before air enters. The five balls are all of the same diameter and weight, and are distributed in semi-circular form in the floor of the mixing chamber extension. The air entering by way of these ball-guarded ports does not pass the spraying nozzle, in which is an adjustable needle valve. This carbureter is made with the main air entrance in the form of a vertical passage within the ring float.

Stromberg Motor Devices Company, Chicago.—In addition to its regular 1908 carbureter, the Stromberg company exhibited its new concentric-float type, designed for air-cooled and small motor work. This carbureter uses the glass float chamber and the nozzle without a needle valve. A new principle in it is the method of raising or lowering the float level. The float is supported on the long end of a horizontal lever, with the needle valve regulating the gasoline entrance on the short arm. Ordinarily the float end of the lever

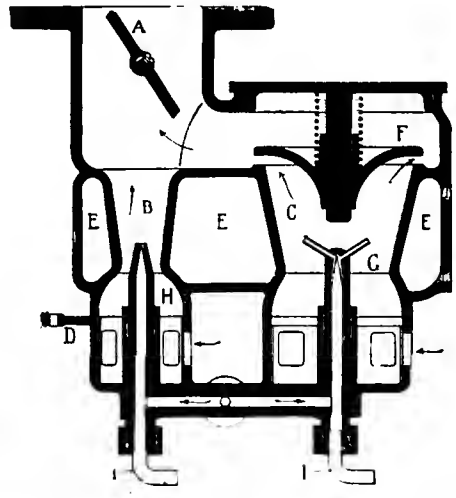
is down, but additional pressure can be placed on the needle valve end by changing the tension of a coil spring surrounding the needle valve. Increasing the spring tension makes the float easier to lift, and, consequently, the gasoline level in the float chamber is lowered, whereas lessening the tension makes the float harder to lift and raises the gasoline level. The spring is adjusted from an external lock nutting device. A retained feature in this carbureter is the double spring control of the auxiliary air valve, one of the springs coming into use immediately the valve begins opening, and termed the slow-speed spring, and the other coming into action only on further opening of the valve, and styled the high-speed spring. External means are provided for adjusting each spring from the outside.

Wheeler & Schebler, Indianapolis.—The feature of one new Schebler model is the control of the gasoline supply past the needle valve in the nozzle by the auxiliary air valve. This is accomplished by a linkage connected with the valve, which connects with a rocking piece carrying the needle valve. A flat adjusting spring determines the amount of lift given the needle, and acting behind this spring are two screws which change the spring contour, one changing it towards one end to give greater gasoline feed at low speeds, and the other acting at the other end to vary the feed on high speeds. By varying these two screws any desired mixture can be had. In order to prevent injuring the needle valve point by screwing it too tightly on its seating, the stem is made with a ball on its upper end resting in a socket holder to permit of universal movement, and behind the ball a spring is interposed between it and the adjusting screw, which spring compresses under too much movement of the screw, thereby saving the valve point. In some of the other Schebler models the gasoline is controlled by the throttle, which with more or less opening there is a proportionate raising or lowering of the needle valve. The amount of lift for a given opening of the throttle can be varied by two adjusting screws, and in addition to which is the regular screw adjustment of the valve. The auxiliary valve is spring controlled, and the main air opening is a central passage through the ring float.

Willet Engine & Carbureter Company, Buffalo, N. Y.—In connection with its two-cycle engine with rotary crank-case valve, this company has developed a new original and different type of carbureter. In a word, this consists of two carbureters in one, each with its own spray nozzle and adjustment.

This carbureter is of the double automatic type, using a small carbureter on the low speeds, and a second, cutting in automatically, for intermediate and high speeds. Each carburcter is adjusted by an individual needle valve, and both carbureters are entirely surrounded by a hot water jacket.

There is a throttle (marked "D" on the half-section drawing) which, when closed up, creates a strong vacuum on the spray nozzle, thus drawing a rich mixture to make easy starting possible. The valve is then opened to its normal position, which is wide open. Should the weather be cold and a richer mixture required, this valve may be closed somewhat. This may be done from the dash, while the car is running, without disturbing the needle valves; thus it is possible to change the mixture in the carbureter without disturbing the needle valve adjustment. Perfect mixture is obtained by this carbureter from very low speeds to extremely high speeds owing to the independent adjustments. The automatic valved (marked "F") has a slight spring tension back of it. This valve cuts in the second carbureter whenever necessary. The entire carbureter is controlled by a butterfly throttle valve (marked "A"). Ports in the intake chamber are lined with a fine mesh brass screen, which keeps all dirt



Details of the Willet Carbureter.

from entering. A strainer is also fitted in the coupling underneath the float chamber, which keeps dirt from getting into the float chamber through the gasoline intake pipe. Float is of weighted cork, suspending a ball valve on bottom of carbureter.

The needle valves (marked "H & G") can be readily removed for inspection, and replaced without losing their adjustment. A singular jet is used on the low speed in the small carbureter, and a series of four jets, controlled by one needle valve, is used on the second carbureter (or the one marked "C").

GASOLINE INDICATOR.

Randall-Faichney Company, Boston, Mass.—This company is handling the product of the Webster Mfg. Company, which consists of a gasoline indicator. In substance this is exceedingly simple, a float at the end of a metal arm turning one of a pair of gears, the other being on the bottom of the spindle, which carries the indicator hand, turns with it, thus indicating the amount of gasoline left in the tank.

MATERIALS USED IN AUTOMOBILES AND ACCESSORIES

STRIPPING the whole question of the glittering generalities that follow in the wake of the enthusiasts who cluster around the automobiles at the show from morning until the orchestra sounds the "retreat," taking into account a previous detailed knowledge of the practices and the incentives—even allowing that some of the things can be improved—it is possible to detail a story of the use of good materials and to show that they are available for service.

When a builder of automobiles says good materials are used, that die forgings are in the axles, that forgings are made in one piece—no welds—that the dynamic ability of the parts that have to sustain under under severe conditions of shock service is adequate, than it is time to look for the evidences of ability and the question is, Where did the quality grow?

If good materials are to be had, they must be on the surface, in plain sight; few, indeed, are the men who hide their light under a bushel. Look around the show, see the exhibitions of accessories, note the display of materials of every kind. The evolution of a half-score of years hangs to the show like a specter, steeped in the persistence which, like time, is dyed in the wool. Go down the line and every foot of the way will be contested by things that compel attention. View the whole situation with a critical eye and what will be the result?

The automobile industry is out of its knickerbockers, and it has conducted a "Cook's tour" of accessories along with it; it may be the conductor, but it is only one swallow; the accessories are as the rest of the flock. Along with the accessories will be found the "parts." Makers of automobiles use parts, and they get them—in the majority of cases—from the parts makers. The claim is frequently made that an automobile is not so good because parts are used, parts that are made outside of the assembling shop. Is a Waltham watch bad because the case is made in another shop?

All shops are divided into departments, and each department is under the guidance of separate men. Does the fact that the same "board of directors" controls the several departments account for the good work in them? The board of directors merely authorize the work. They do none of it. The same conclusion is that in which allowance can be made for good work in any shop, and if the products are all as per drawing, and the materials are all good, the sum will be a good automobile, watch, or whatnot. But if a company does not pay the price that will command good things, it is as sure as shooting they will not be good. This is the phase of the situation which leads to discussion along lines reflecting the bad qualities that can, and sometimes do, reside in assembled automobiles.

The makers of accessories and of parts are wise enough to know that the thing for them to do is to charge for good work, suitable material, and the finish that will reflect credit upon them. They know that purchasers will in the long run say what they will have, and refuse what they think is not worth the price. The result is, the makers of accessories and of parts are in a large measure responsible for the quality that resides in automobiles as displayed at the show; they made the low prices possible.

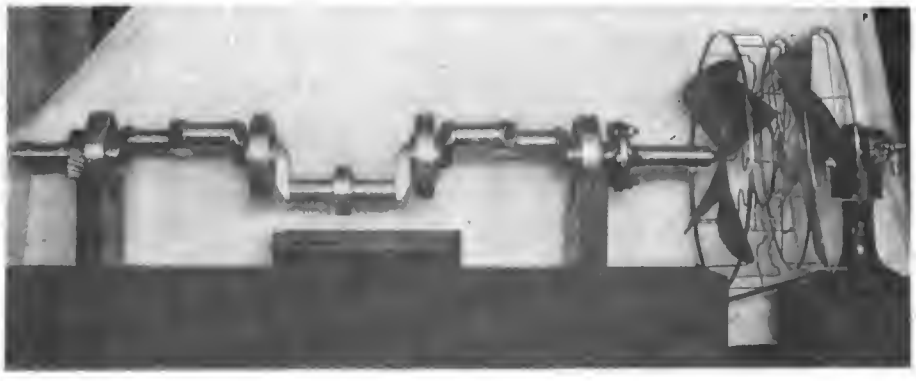
Specialists doing some one thing can do it well and quickly. These same specialists can quote a low price, and they can make it worth while to an assembler to use their product As a matter of fact there is no better sign of quality in many of the cars of the day than the fact that "so and so" furnishes the axles, or the ball bearings are of such a make, and so on all along the line. When it comes to certain parts of automobiles, as magnetos, spark coils, batteries, spark plugs, and, in fine, a wide range of the materials used, they are almost invariably the products of separate establishments.

That good cars are good because they are so made is assured: it is not because they are segregated from the parts to be had from available sources, nor because of a two-ring circus under one canvas. That good accessories and parts of great merit may be had, is proven by the fact that they are at the show, open to the light of day, or the critical inspection of any man who is looking for quality rather than trouble. They are there and the price is very reasonable, indeed.

AXLES AND BEARINGS

American Ball Bearing Co., Cleveland, O.—In the trade this company has a wide circle of acquaintance because of the vast number of high-grade balls turned out at the works. But if the company produces this product, it is also a fact that of ball and roller bearings a liberal quota comes from the Cleveland plant. Then, it is true as well that the American output of live rear and other axles and auto parts generally runs into a vast annual product. The class of work turned out by the company is best sized up by noting that American products are found in nearly all of the finest cars.

Hess-Bright Manufacturing Co., Philadelphia.—There "with the goods," the Hess-Bright Company is in supreme presence, with ball bearings (the H-B and D.W.F. kind) known in every land to which the automobile has traveled and returned without trouble in the bearings. This year the company is offering to the trade a "magneto," the qualities of which are assured by the endorsement of Henry Hess. This year sees this company with a line of "auto-hubs" of a distinctive character in which H-B ball bearings are used, and in which all possible means for safety are incorporated in the thorough manner to be expected under the guiding hand of engineers of such well-known skill. In the hubs the ball bearing spacers are also used, to take the responsibility should one of the ball bearings fail in service. History does not seem to know of a case of failure, and were it not for the fact that the spacers



Hess-Bright Ball Bearing Propelled by Air Fan.

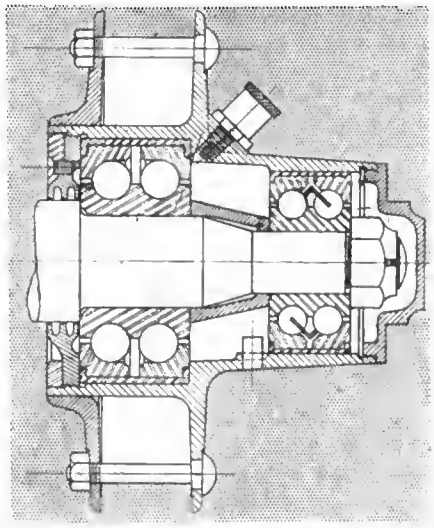
have to be used anyway, it would look like an addition without a compensation. At all events, it is a "safety" at no extra cost, and as "Bob" Clingen, of the "Hess staff" puts it: "Mr. Hess takes no chances." That H-B ball bearings are regarded as valuable is proven by the fact that, at the show, they are all nailed down to the show board. Otherwise they might make fine souvenirs.

Hyatt Roller Bearing Co., Newark, N. J.—If "ham" spells "pig," "Hyatt" should spell "success." Anti-friction bearings are looked upon as of the utmost importance in automobile work, and it was

Type of Hyatt Roller.

the privilege of the Hyatt Company that had as much to do as any one with the question of how the bearings shall be. Hyatt roller bearings are used in live rear axles, transmission gearsets, and, in fact, in all the places of responsibility which call for the use of an anti-friction type of bearing. The "improved cage" holds the flexible rollers in correct alignment. The company now has some fifty distinct sizes in such shape as to assure prompt delivery. In 1901 only two cars were fitted with Hyatt bearings; 1907 saw twelve times as many makes of cars rolling on Hyatts, with another big increase in 1908.

New Departure Manufacturing Co., Bristol, Conn.—In this age of sharp competition the idea of "waylaying the early bird" is rather bold, and to "get the drop" is a necessity, since the bird goes armed with merit, as a rule. The early bird is a clever chap, but the New Departure ball bearing will pull tail feathers if not well watched. In any case, the New Departure is out for its share of the glory, and it will be all right if the same is accompanied with a little profit, not only for the company, but for the users of the bearings as well. In a matter of this sort an advantage is—like the New Departure ball bearing—"two in one." This type of bearing takes thrust and radial loads, and its value has been tried out in "taxicabs" under conditions such as they obtain in New York City. D. F. Graham, in charge of sales for the company, who was formerly superintendent of the New York Taxicab

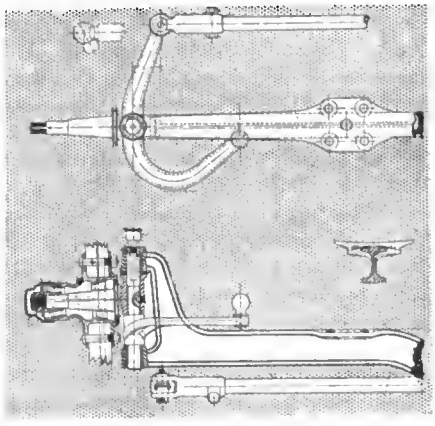


New Departure Ball Bearing.

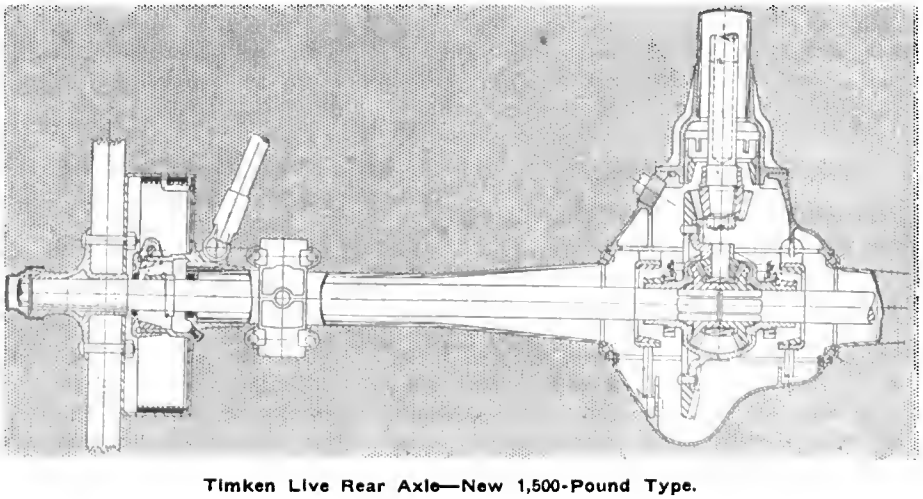
Company, sets forth the claims of the New Departure in convincing language, and his experience in this line gives him advantages which tell. The "two in one" idea is adequately illustrated at the show in that the bearings are placed to support a big flywheel that puts thrust and radial load on the bearings.

Standard Roller Bearings Company, Philadelphia.—This company offers ball or roller bearings in every place of any considerable responsibility. For standard journal work there is the well-known Standard roller bearing; then there is a line of shafting hanger bearings and thrust bearings in ball and roller types. Of annular ball bearings the Standard Company has a full line, and they are so much used that reiteration is a mere matter of form. When it comes to balls the Standard makes them from "tool steel" to the line, such as serves well the purpose in bearings for even "lawn mowers," and it is not too much to say that a Standard bearing can be had for every application under the sun.

Timken Roller Bearing Axle Co., Canton, O.—Roller bearings of this make are used in so many of the automobiles of worth that the company is known throughout the length and breadth of the land. The home of the "Timken" is worth going there to see. At the show, the "Timken" has a new 1,500-pound type of front and rear axles that draw the "magnates." The front axle is of the I section of the usual Timken shape and accuracy of design, while the rear axle is "live," light, strong and complete. The new line of Timken—"short"—taper roller bearings is so much of an advance in the industry that it cannot well go unnoticed. Then, there is the Timken truck front axles in one, three and



Timken Front Axle.



Timken Live Rear Axle—New 1,500-Pound Type.

five-ton sizes, with Timken roller bearings in the knuckles, which should go a long ways towards rendering steering pleasurable and safe.

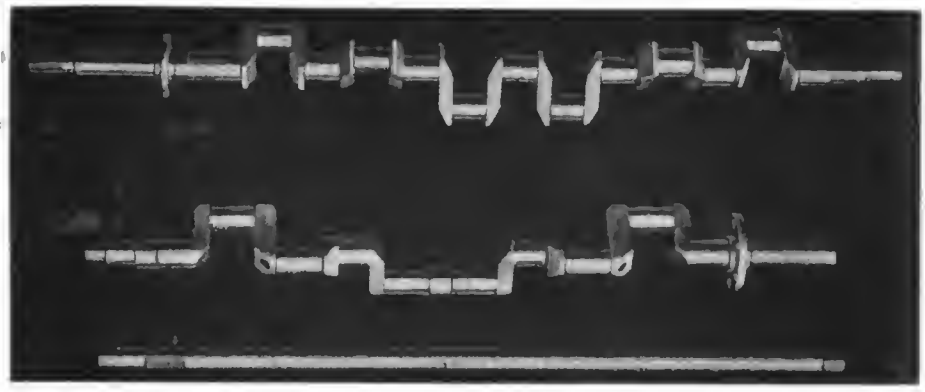
CASTINGS.

William Cramp & Sons Ship and Engine Building Co., Philadelphia.—Axles, motor cases, steering gear housings, side levers, motor arms, connecting rods, linkages, brackets and multitudinous small parts, all of Parsons manganese bronze, from the famous plant of the great ship builders, Wm. Cramp & Sons, are in splendid profusion at the show. It looks like gold, this bronze. In practice it is like gold, in that it does the work up to the standard of the highest expectations, and it lends itself to the task in a manner not to be imitated, since it can be cast in intricate shapes with no limit to size. "As strong as an ox," is an old and trite saying that fits the case, as the following record of a test of "Parsons" will indicate: Tensile strength per square inch, 79,800 pounds; elastic limit per square inch, 42,500 pounds; elongation in 2 inches, 40 per cent.; reduction of area, 40.6 per cent. "Think it over," is what the expositor says.

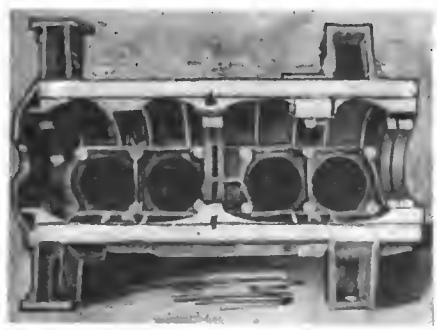
Henry Hess, Philadelphia.—German made steel castings will be a Hess specialty pending the time when Henry Hess, of Nineteenth Street and Hamilton Avenue, Philadelphia, will fit out a steel casting plant. The examples of steel castings to be seen at the show are of more than passing interest because the shapes are intricate and the castings are of fine appearance, thus indicating that the claims made for them are not without good ground. Mr. Hess contends that the process used eliminates all the old drawbacks that long stood in the way of steel castings for many purposes.

The United States McAdamite Metal Co., Brooklyn, N. Y.—McAdamite belongs to the aluminum genera. It came on the market a few years ago when aluminum was a little uncertain, but it has never shown any of the uncertainties of aluminum. It is used for every purpose that aluminum can be used, and its range of uses expands far beyond. Aluminum is light. McAdamite is light. Aluminum is strong; McAdamite is stronger. If aeronautics expand, it will be the metal of them all to do the work, and it is now largely used in this service, even for motor connecting rods. The price of this metal is low enough to enable it to be used in any place requiring light, strong metal, and as to the strength it is best disposed of by a record of a test as follows: Tensile strength per square inch, 44,250 pounds; compression per square inch, 126,000 pounds; torsion per square inch, 66,300 pounds; specific gravity, 3.20; fusing point, 1,040 deg. F.

Light Manufacturing Co., Pottstown, Pa.—The exhibition is of a "foundry product," comprising aluminum, manganese bronze, phosphor bronze, plastic bronze and babbitts. The best reason why the Light Manufacturing Co., of Pottstown, Pa., will be able to deliver satisfactory castings of the kind is as the company states: "We are machining them every day and this helps us to know what we are doing, instead of waiting to have our customers tell us." At all events, this company is doing a large share of aluminum casting work, and on the basis that "a customer is a partner" the situation is one without a loophole through which a flaw can meander in.



Dreggs-Seabury Alloy Steel Crankshaft Work Portrayed.



Light Mfg. Co. Aluminum Work.

Wetherell Finished Castings Co., Philadelphia.—The name spells finished castings all over, and there is no use to which castings can be put that this company will not undertake. The Wetherill Company is in a position to make everything by way of castings that can be used to advantage in automobile work, and a visit to the show will be incomplete without paying a visit to the Wetherill.

PRESSED STEEL

Dreggs-Seabury Ordnance Corp., Sharon, Pa.—The gunmakers of Sharon, Pa., with a plant, which on a war footing could supply the army with guns and ordnance a plenty, is well equipped to do automobile work, now that the automobile is up to the high level which was always essential when reference is had to ordnance. When the rush of the show is off, it will make fine reading; a story of how they do it at Sharon, those gunmakers, and in the meantime it will be well to call attention to the fact that the Dreggs-Seabury "pressed steel rear axle housing" is the acme of stability, and the weight is down where it belongs. Fine material and the process that is natural to a plant which does work for "Uncle Sam" must in the long run find its way into such important parts as the housings for live rear axles. But the Sharon plant is not confined to just these parts, for at the show there are "drop forgings" gears and chassis frames as well as crankshafts and such like. This company can make anything in pressed steel, forge hammered and forged in dies. The materials the company uses are so fine that it is only in a gun or an automobile that they would find a resting place. Indeed, the Sharon plant will furnish drop forgings in all the tough-hard grades of alloy steel, as well as the products in carbon steel, a matter of greatest importance.

A. O. Smith Company, Milwaukee, Wis.—Pressed steel is now used for many purposes besides chassis frames in automobiles and the A. O. Smith Co. is "on the job." When it comes to chassis frames this company has them in all the forms, from the latest "drop frame" to the big channel shapes for trucks that stretch from "here to there." In material the parts are made in all choice selections, as alloy steel, special carbon and mild steel. There are cross members in intricate shapes that would be considered out the question a couple of years ago, and from brake-drums to spring suspenders the display is well worth spending the time if only to speculate as to how they do it. Nor is it so much a question of the diversity in form, from the ponit of view of "pressed steel," as it is the fact that this is an enormous industry that the automobile gave birth to, and the A. O. Smith Co. had a large say in the making of it. It was not a question of nerve, so much as a matter of business acumen and courage that brought results.

CHAINS

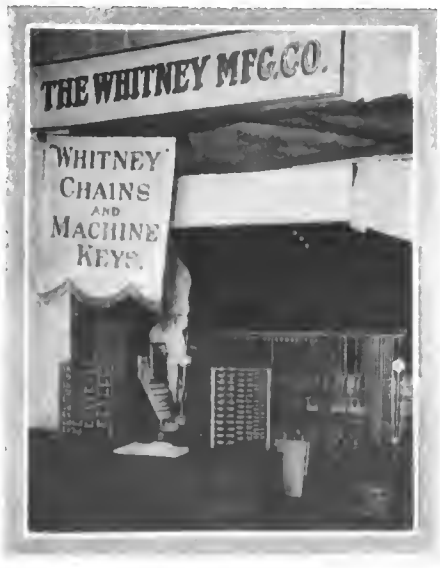
Baldwin Chain & Manufacturing Company, Worcester, Mass.—In addition to its regular line, Baldwin roller chains, sprockets, and the new Baldwin improved

detachable chains, especially designed for automobile use, this company is now placing on the market a new and improved type of automobile steering gear. This is designed along totally different lines from those now favored by current practise for this purpose and the result has been not only to greatly simplify the gear as a whole, but likewise to make it an extremely reliable device in which wear has been distributed over such a large surface as to be practically a negligible quantity. A detailed description of this new steering gear will be given in a later issue.

Charles E. Miller, New York City.—The space allotted to this accessory dealer is not equal to his importance, and the large line of goods handled, besides which, it is not well located, being hard to find and sandwiched in between two automobiles. The principal feature of an excellent exhibit is the English made "Brampton" chain, which may now be had in American sizes, as well as the former metric sizes. These celebrated driving chains are made throughout of self-hardening steel of superior quality, made accurately to gauge, and carefully assembled and polished so as to fit the sprocket with a minimum of friction. No provision is made for replacing the heavy chamfered side plate, because in the history of the company no torn, broken or sheared side plate has ever been brought to their attention. This fact in itself speaks volumes for the merit of the "Brampton" chain.

Diamond Chain & Manufacturing Company, Indianapolis, Ind.—One of the most interesting parts of the Diamond exhibit is something that the average visitor is not apt to realize the value of unless his attention is called to it, and that is "Pamphlet D," the mission of which is to describe "Diamond Chains, as Applied to Chain-Driven Automobiles." It is of more than ordinary interest for the owner of a chain-driven car of any type or model, since it not only gives the names of makers and the models on which they are now using chains, but every model of chain-driven car that has ever been made in this country. The width, length and number of chains used, i. e., whether single or double side chain-driven, is given in every instance so that the pamphlet is an aid in ordering a replacement for an old car. Attention is also called to the fact that Diamond chains are made to fit sprockets of any standard, and can be used on American chain-driven cars of any make. Nickel steel rivets are used in the manufacture of all Diamond auto chains.

Whitney Manufacturing Company, Hartford, Conn.—In addition to the "Wizard" chains and sprockets, rollers and block chains, made by the Whitney Company, and which are too familiar to call for extended mention, this concern also shows a number of specialties for automobile manufacturers, such as the Woodruff system key cutters, water tool grinders, hand and weight feed milling machines, "Presto" chucks, collects and friction tapping devices and the like. "Whitney Chains and the Cars They Drive" is the title of a booklet under date of July 1, 1908, detailing the dimensions of Whitney chains used on many of the leading makes of American cars, and attention is called to the fact that the Whitney Company is now preparing to furnish roller chains for all American chain-driven cars, whether the sprockets are cut to the Whitney standard or not, special attention being paid to odd sizes.



SPRINGS.

Burnet Compound Spring (Inc.), Newark, N. J.—The "Burnet" is there, and its non-shock qualities are being demonstrated in a manner intended to convince the interested spectators. The spring consists essentially of two superimposed elliptic springs so designed as to afford that flexibility so much desired, without the spring play that generally goes with it.

J. H. Sager Co., Rochester, N. Y.—A line of equalizing springs that promise immunity from the ills of road inequalities and the large cost of maintenance that follows. In action, the "Sager" type of spring works freely, and in reaction the violent upward tendency is checked without any undue rate of change of motion.

Perfection Spring Company, Cleveland.—The use of fine materials, such as "Krupp" steel for springs, renders it possible for the Perfection Spring Co. to hold the reputation for quality that its springs have made for it in automobile work. The "Perfection" is a special spring with easy riding qualities as a proven fact, and hundreds of testimonials to show for it. The company also makes springs after designs by the makers of cars, adding the knowledge due to a wide experience if the designers so indicate. On the other hand, if car builders have just what they want, the Perfection company sticks to the specifications.

FORGINGS, TUBINGS, JOINTS.

Anderson Forge and Machine Co., Detroit, Mich.—Located in the heart of the Michigan automobile industry, it is not to be wondered at that this company has progressed along lines such as ended in a line of "drop forgings" for automobiles, including crankshafts, connecting rods, and, in fine, everything that can be of any value in automobile work. The company is equipped to do a vast amount of the highest grade of drop-forging work, and the materials used by it are of the superior grades for the purpose.

Spicer Universal Joint Mfg. Co., Plainfield, N. J.—This concern shows by its line that it has fully realized the importance of universal joints as one of the vital parts of a complete car if the full power of the motor is to be properly applied to the rear wheels. For the coming season it is producing a line of these joints in about a dozen different varieties, from the simplest to the complete propeller shaft with double universal. Recognizing the fact that there is a change in the velocity between the driving shaft and the driven member where only one universal is used, models No. 26 and No. 30 are especially designed to overcome this. Spicer universal joints have a large bearing surface, are easy to take apart, and protection from "grit" is adequate.

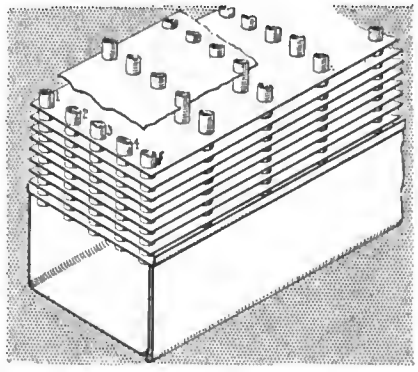
Standard Electric Welding Co., Cleveland, O.—This company turns out seamless steel tubing and steel rings, as well as axle housings in the same way, clincher rims and all the other things of steel electrically welded or in seamless form. The Standard exhibition is of the greatest interest, and the company probably plays a far more important part in the trade than the average designer of automobiles dreams of. The "parts makers" all claim the Standard as a twin brother, and when the Society of Automobile Engineers went to Cleveland last Summer they visited the plant of the Standard Welding Co., in which they were enabled to "see things."

Shelby Steel Tube Co., New York.—Shelby steel tubing is the subject, and the wide range of this material offered by the company is reflected at the show. This tubing is made in rounds, squares, and special shapes that have to be good to stand the process, which process, however, improves the quality of the material, in that "fabrication" when properly conducted always adds to the physical properties of steel, if the material is of a quality such as will stand the process. The "show board" of the Shelby is a picture to behold; upon it will be found all sorts of products, hubs for wire wheels, bicycle forks, pump barrels, taper tubes, gas engine cylinders, upset tubes, etc. What attracts much notice is a tube tied in a knot. This in itself demonstrates that the material is of fine character. Shelby steel tubing has a wide range of uses in automobile work, and it has always had the reputation of making good.

Shelby Steel Tube Upset at Both Ends, Showing Quality.

RADIATORS.

McCord & Co., Chicago.—For general appearance the radiators as made by this company are all that can be desired. The plan is one that results in great stability, and the efficiency of the radiator has been pronounced good by the many users of the type. It will be remembered that in the McCord the water tubes are vertical and flat plates, quite closely spaced, serve to radiate off the heat.



Section of McCord Radiator.

Briscoe Mfg. Co., Detroit, Mich., and Newark, N. J.—This concern has for this year tubular and cellular radiators. The horizontal tubular type contains flat tubes extending from right to left and arranged so that two tubes side by side alternate with one placed centrally. Cooling is by vertical metal plates whose edges face forwards. The Briscoe honeycomb radiator is made by taking lengths of seamless tubing almost one inch in diameter. By pressing in a form this tube is made into three diamond-shaped tubes, the ends being diamonded and the central parts slightly corrugated, so that when two or more sets of these three tubes are put together, a water place is left between them; but the regular diamond-shaped ends unite forming a containing wall. This allows of a vertical water flow and a horizontal flow between each two, three or five squares.

GEAR SETS, ETC.

Brown-Lipe Gear Company, Syracuse, N. Y.—The new transmission gearset of the Brown-Lipe make is styled after the same make of transmission as used on "Thomas" cars, exceping that the position of the "second" shaft is reversed. It is a neat piece of work, well up to this company's standard, with alloy steel gears and parts of responsibility. The case is of aluminum. The greatest advance, perhaps, lies in the methods of heat treatment this product is subjected to.

Merchant & Evans Co., Philadelphia.—The Hele-Shaw is the multiple disc clutch in which the discs "engage" on the grooved faces instead of on the flat. With ten sizes to choose from, the builders of automobiles are enabled to get what they want; for the little car with the "one lung" or for the ponderous racing car one will find a clutch to match. The Hele-Shaw idea came from abroad, as did many of the ideas which automobiles fell heir to, and it is one that has not been "messed up." The Merchants & Evans Co., report new converts to the swelling list.

SHIELDS, TOPS, BODY MOUNTINGS, SHOCK ABSORBERS

E. T. Burrowes Company, Portland, Me.—The Burrowes windshield made in halves differs from many others in that the lower half can be set at any angle to the car dash, and the upper half also mounted at any angle to the lower half. The shield is supported without forward extending brace rods, but by short brace rods extending from projecting brackets on the rear of the dash. The brace rods attach to the top of the lower half and into a bracket on the bottom of the lower half, which bracket hinges to that on the dash, and is held at the desired angle by a thumb screw in the lower half bracket working in a quadrant slot in the bracket on the dash. The top half hinges to the lower half by end hinges, each hinge being made in halves with serrated opposing surfaces, so that by loosening a locking nut on each hinge the serrated faces separate enough to let one be slipped past the other until the top half is at the required tilt, when tightening the locking nut bring the serrations into engagement, thus forming a positive lock.

C. Cowles & Co., New Haven, Conn.—This very old and well-known company is at the show with a fine line of brass fittings as used in automobile work, and among other things the limousine case in two styles attracts much attention. The case for ladies is a marvel of completeness. Besides a watch that will keep time without any question, the case holds all the requisites, among which is a hand-mirror, on the back of which is a slate. Then there is a card case and memorandum books, also a record book, not to mention a "puff." For men the case includes a cigar holder and a container for cigar ashes. These cases are not only of the greatest utility, but they are artistic and distinctive.

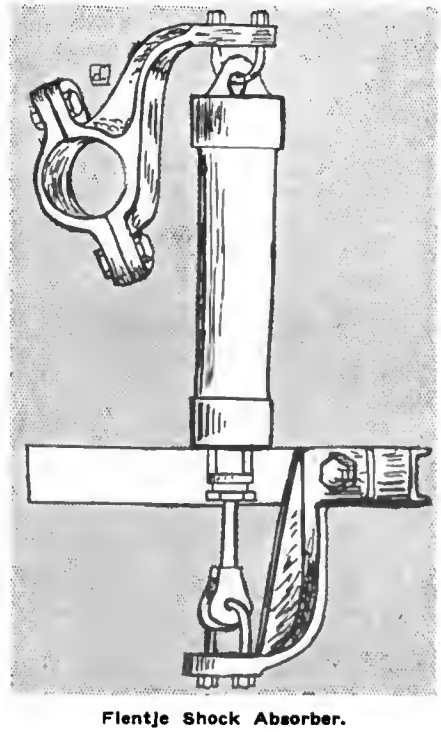
C. A. Mezger, New York City.—In the Mezger windshield the upper half hinges to the lower, and in lowering it nothing has to be done but pull it closed. This is made possible by a spiral spring so placed that it tends to hold it in the up or closed position. The shield is further locked in the up position by an inverted L-shaped hinged catch, the upper or horizontal part of which fits over a toe on the frame of the upper half and is held thereon by plunger and spring, a sudden jerk being sufficient to free the toe from the catch.

Sprague Umbrella Co., Norwalk, O.—The tops and windshields made by the Sprague company show that Col. Sprague has profited by his wide experience in this field of work. Besides the regular full line of tops and shields, this concern is offering for the coming season a top designed to meet the demands for runabout use. It is so arranged that the long front bows sometimes used have been done away with in order to facilitate entering and leaving the car. The forward bows on this top will slide down on the middle one, giving additional ease in lowering and raising. With its long front overhang and sharp turn it makes an ideal protection for either bad weather or hot sun.

Troy Carriage Sunshade Company, Troy, O.—The Troy windshield for runabouts with the angular lower half is fitted with a device to prevent the lower half from breaking when being folded forward to the horizontal position. This, in brief, is a telescopic brace rod, the inner member of which has a split end within which is an expanding nut controlled by a finger wheel at the end of the upper half and in easy reach of the driver from the seat. To lower the shield, it is but necessary to turn the finger wheel, after which the air cushion in the telescopic tube will prevent a too rapid fall.

Vanguard Mfg. Co., Joliet, Ill.—The display of the Vanguard at the show attracted much attention on account of the high character of the devices, notably the Vanguard windshield. Besides a certain desirable stability, this windshield is adjustable from the seat, is both light and strong, and moreover it will not rattle.

Pantasote Co., New York City.—As a substitute for leather, Pantasote is now so well known as not to require a long reiteration of its lasting qualities. As a matter of fact, Pantasote is superior for the several purposes to inferior grades of leather, and for that matter it is so well made that it looks quite as good as most grades of leather in upholstery work, once it is in place, if the workmanship is well executed. There are imitations of Pantasote that do not come up to the scratch, and it is these imitations that should not be used in any comparison to be made. Pantasote is made in all shades of colors and in the several weights.



Flentje Shock Absorber.

SHOCK ABSORBERS.

Ernst Flentje, Cambridge, Mass.—A certain amount of interest is centered around the shock preventer as exhibited by Ernst Flentje. Recourse has been made to the glycerine cylinder with a piston, which has a very simple valve arrangement allowing for compression of the springs without hindrance, but prevents the quick throw-back, as the area of the holes through which the liquid passes on the compression stroke is about five time what it is for the opening. The valve opening is very short and quick of action in both directions. No matter how sudden the closing of the spring, the recoil is smooth and easy, due to the slow passage of the glycerine through the restricted ports.

F. R. V. Auto Parts Company, New York City.—The F. R. V. shock absorber consists of a belt, which at one end is looped around the car axle, and at the other fits over a drum secured to the car frame and attaches to a radial arm carried on a stud, to which a coiled spring is secured. Normally the spring is under tension. When the frame drops as the wheel enters a depression, the strap slackens, but all of this slack is immediately taken up by the coil spring, the belt being wound on the drum. When the rebound starts, it is resisted by the spring tension as well as the friction of the two or three loops of belting on the drum. The principle is the same as when a rope is wound once or twice around a shaft in order to support a weight, or to lower it more easily. The only difference over last year's design is that the spring tension or adjustment of the absorber can be accomplished from the outside without removing the cover cap.

Hartford Suspension Co., Jersey City, N. J.—"Over twenty automobile companies now use them." Truffault-Hartfords are so well and favorably known as to require no further introduction, unless to run over to "old standbys" and to note that they are alive to the advances that time interjects into a "live" industry, which life the "Hartford" did its share—liberally—to interject. In the meantime it is interesting to note that the Hartford Suspension Co., at its plant in Jersey City, is running full capacity, with small chance of doing more than to keep above the orders that naturally are due.

ARTISTIC AND SCIENTIFICALLY DESIGNED LAMPS

Atwood-Castle Co., Amesbury, Mass.—The new double-drip generator of this company's make is well worth the close attention of the users of generators, and the "black-nickel finish" is certainly something to consider when lamps are being selected. In square shapes, the company's line is artistic, and as to utility, the lamps "stay lit." On the whole the Atwood-Castle line covers everything in lamps and generators for the automobile.

Badger Brass Co., Kenosha, Wis.—The exhibit of this company at the show represents an extensive line, with a style of lamp for every purpose in automobile work. The "Solarclipse" and the "Autoclipse" types are handsome and of greatest value in automobile work. Then, again, there is the patent-leather finish" in all the styles of Solar lamps and generators. A leader in the line is the new square carriage there is the "patent-leather finish" in all the Solar motorcycle lamp, in a headlight pattern, including a generator.

Gray & Davis, Amesbury, Mass.—Lamps and generators of this make are known in every nook and corner in the land. The display this year at the show is extensive, indeed. and the company proposes to maintain a lead its goods enjoy in certain quarters, which, however, is not to be the limit of the company's endeavor. In square effects the Gray & Davis oil lamps are of the greatest utility, and the general appearance is handsome. The lamps, with lenses, are of the class in which the lenses can be removed, and the old game of soldering and riveting is not present in Gray & Davis lamps. The generators of these lamps are of the class that commands attention.

C. T. Ham Mfg. Co., Rochester, N. Y.—These makers of the Ham "cold-blast" auto lamps are at the show with a full line, and visitors comment favorably upon the display. This company is furnishing lamps in the usual "bright" finish or in the "black nickel finish" so prone to be the feature of the year in lamp and generator finishes. In one other particular, the Ham lamps are worthy of more than a little attention: the oil lamps are so designed as to admit of the use of electric lights, or acetylene burners can be used instead. This is a feature that will be much appreciated by autoists in general.

Rushmore Dynamo Works, Plainfield, N. J.—In lamps and generators the Rushmore line is, as usual, so complete as to be up to every requirement of the autoist and the maker of automobiles, if quality *per se* is to be the guide. Rushmore also has the happy faculty of landing a surprise at regular intervals. This year the present from the Rushmore plant to the autoist by way of a generator will be "valveless." When this statement is made every autoist in the land will know what it means, and further comment is a waste of time. The new Rushmore idea is one that takes account of a perfectly even flow of the gas, at the required pressure, and it will be well worth a trip to the show to see how Rushmore accomplishes the trick. That he does make good is assured. The new multiplex non-flickering glass system of the Rushmore line is attracting much attention.

Edmond & Jones Mfg. Co., Detroit, Mich.—This company has on exhibition a splendid line of lamps and generators in the regular finish as well as in the "black nickel" finish. The originality of some of the designs is favorably commented upon by the spectators, and the company reports good business. In side oil lights the square effect is something to take a second look at, and the generators by this company are of the greatest utility.

George S. Sherman, Great Neck, N. Y.—The circular rotary light as made by this company is something for every autoist to consider. By means of the Sherman equipment it is possible to project the light in any direction before the car turns. In this way the chances of getting off the road or of colliding with an obstruction, out of the line of the usual fixed light, is avoided.

J. W. Brown Mfg. Co., Columbus, O.—This company is at the show with a fine line of automobile lamps in all the latest shapes and finishes. The generator is of an approved pattern, free from any tendency to clog up, and by its principle of design the gas is furnished at an even pressure, free from impurities and capable of making a pure white light of great intensity. The company is in a position to entertain any lamp proposition involving quality.

TELL-TALE SPEEDOMETERS IN VARIETY

Auto Improvement Company, Brooklyn, N. Y.—These manufacturers of the Ever-Ready centrifugal-force speedometers, with which are incorporated odometers "made in Germany," have made a great improvement in all of its instruments by the use of the new direct drive which is made without any springs. A new Universal model has a floating indicator supported from the periphery of the dial, rather than a pointer supported at the center like the hands of a watch. All instruments are fitted with the straight vertical shaft drive.

Hicks Speed Indicator Co., Brooklyn, N. Y.—The Hicks indicator, made in four models, is characteristic because of its square glass, beneath which is a crescent-shaped dial, a clock, season and trip odometers, according to the model. This speedometer operates on the centrifugal force principle, the two oppositely placed ball governor weights being carried on a vertical shaft, which is within the instrument. The regulation from the governor sleeve to the indicating needle is through a lever combination. One of the models is fitted with a maximum speed hand, while two others may be so fitted at an extra charge.

Hoffecker Company, Boston, Mass.—The Hoffecker for 1909 is made up of a combination speedometer and Chelsea clock with the total mileage and trip mileage indicators incorporated in the speedometer. To illustrate the steadiness of the hand

some ingenious person constructed a jolting apparatus on which the instrument is mounted and in operation at various speeds.

Jones Speedometer Company, New Rochelle, N. Y.—This old and well-established firm has met the demand for a more popular-priced instrument by placing upon the market, along with its regular line of about twenty different styles, three new models of the straight drive type. No. 27 and No. 28 indicate speeds up to 50 miles per hour and are fitted with odometers. No. 29 registers to 60 miles per hour.

Stewart & Clark Mfg. Co., Chicago, Ill.—Speedometers have come to be looked upon as almost a necessity in the equipment of a car, and this concern has constantly kept abreast of the times with a complete line. For 1909 it has added to its already long list of types working on the centrifugal force principle, a magnetic one, No. 11, with the indicating hand carried in the center of the dial, the scale forming almost a complete circle. The season and trip odometer, with the new resetting device, are all incorporated in this type. All sorts of combinations of speedometers and clocks are made, and at prices which are within the reach of every owner.

Veeder Manufacturing Company, Hartford, Conn.—The exhibit of this firm is complete with a full line of its liquid speedometers in operation at different speeds. The liquid used is either colored alcohol or kerosene, held in a small reservoir at the bottom of the instrument, under which is a centrifugal pump driven by the flexible shaft. The liquid is forced up into the calibrated vertical glass scale from the periphery of the pump, the height being relative to the speed. Both the odometers are held at the side of the vertical scale, where they may be easily read by the driver.

Warner Instrument Company, Beloit, Wis.—Although the outward appearance of the Warner instruments has been changed some for the coming season, the workmanship remains of the same high order as formerly. These recorders are of the magnetic type, furnished with 10,000-mile season and 1,000-mile trip registers, and an enclosed electric light. The Warner-Auto clock is mounted above the speed indicator if so desired. As an effective antidote for friction and wear, and to insure absolute accuracy of operation, the dial rides in sapphire jewel bearings.

INIMITABLE SIGNAL SYSTEMS EXHIBITED

Automobile Supply Mfg. Co., Brooklyn, N. Y.—In common with many other sundries and accessories made and sold by this concern, the full line of Nonpareil horns was exhibited with telling effect. A new line is being brought out for the coming season, which will appeal to the particular buyer. These horns are on a new patented line and have a rich, penetrating tone. The novelty, compactness of construction, and reasonable prices should make these horns leaders for 1909.

Comptoir d'Innovation Pour Automobiles, New York City.—This concern with the unpronouncable name show an air compressor with another jaw-breaking name, the Delpeuch. This is an excellent little water-jacketed single-cylinder compressor of very simple construction, with no packing or washers. The diameter is 2 3-8 inches, and the stroke 5 1-2. It will work in any position, can be driven by hand, chain, belt, or otherwise, and can be used anywhere that compressed air is useful. This size will produce a pressure of over 100 pounds in a 50-gallon tank in less than 10 minutes, while a smaller size of a similar type and construction, but without the water-jacket, will give 90 pounds pressure in any tire in less than a minute. The Delpeuch jack and the "Nightingale" horn were also displayed.

Gabriel Horn Mfg. Co., Cleveland, O.—The product of this company is too well known to require any detailed description. So, too, was their exhibit, which was just a showing of good horns. These were present in all sizes, and a human exhaust seemed to be ready at all times to show the tone of any fancied horn. The growth in the use of these pleasant announcers of one's approach has been so great that factory additions are contemplated to care for the additional business. Realizing, too, that an efficient muffler cut-out in conjunction with the horn relieves back pressure and increases the motor power, they have introduced a new design of muffler cut-out valve, which is so designed as to decrease the back pressure.

Garage Equipment Co., Milwaukee, Wis.—Malleable instead of cast iron is used in the construction of the Hux combination muffler and chime valve. There is a direct passage of the exhaust either to the horn or to the cut-out. While the latter is being used the horn generally is closed. The cut-out and horn valve are independent and both can be used separately, which does away with the necessity of having two valves. Butterflies are fitted and operate on brass pins.

Sireno Company, New York City.—This manufacturer of electric siren horns is showing, besides the older models, two new types for 1909. These, called respectively the "Sireno" and the "Sireno Junior," resemble in external appearance the ordinary searchlight. The former is for touring cars and the latter specially made for runabouts and other small cars. These two new additions to the Sireno family have embodied in their construction a number of improvements which make the horn more flexible, starting and stopping the instant the button is pushed. Both of these new types have ball-bearing motors and will operate on six volts. Interest displayed in these new horns must have been gratifying to the manufacturers, crowds surrounding the exhibit whenever observed.

OIL, GREASE, AND GRAPHITE LUBRICANTS

H. F. Alexander & Company, New York City.—The well-known Panhard cylinder oil, the oil in the checkerboard can, is shown by this firm, which manufactures it under a license. Grease made by these people was also shown. With the great interest displayed in all oiling devices this year, which cropped out in the form of oil or grease cups on every rotating part, it was not surprising to find a crowd before every oil and grease exhibit in the building. The Panhard oils attracted much attention.

Joseph Dixon Crucible Company, Jersey City, N. J.—The discussions in the trade papers during the past year on the relative merits of oil and graphite for lubrication purposes paved the way for the intense interest in the graphite exhibits. The largest of these was that of the Dixon Company, which showed flake graphite for mixture with oil to be used for crankcase lubrication, graphite cup grease, graphite wood-fiber grease for gear cases, chain compounds for chains, pipe-joint compounds for exhaust pipe joints, and many other forms of commercial graphite.

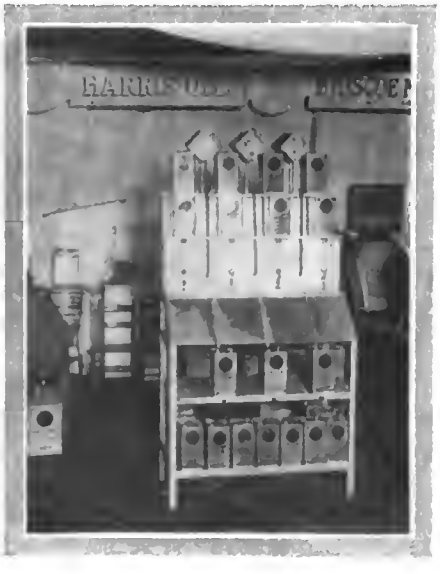
Duffy Grease Company, New York City.—A transmission in action, driven by an electric motor and packed with Duffy's grease, was a feature and attracted a lot of attention from the visitors to the gallery. This company specializes on greases not only for automobiles, but for all forms of machinery and all classes of moving and rotating mechanism. The grease showed that it is good stuff, as it had been running for over twenty-four hours when viewed. This long, hard use had not made it any more fluid than at the start, proving the truth of the company's motto, "Once a grease, always a grease."

A. W. Harris Oil Company, Providence, R. I.—This company adopted a most unusual and original method of displaying its lubricating oils. This consisted of a high, narrow stand on the top of which four slightly inclined cans were allowing oil of the four different grades to flow through a small capillary tube into a large glass standpipe, thus showing how the oil flowed and its even color. From the base of the standpipes, the oil rose to another series of cans, from which it was allowed to flow upward through a gauge glass drop by drop into a third series of cans. From these it was led out onto open inclined zinc troughs, where the oil could be examined and felt of. Four grades of oil were thus displayed, the light, medium preferred for cylinders, heavy and a new grade called superheated steam, which is of 700 deg. fire test. The whole exhibit was very interesting and instructive. In addition the company were giving away oil barrels—printed on heavy cardboard.

Havoline Oil Company, New York City.—These well-known makers of highest grade oils under the trade-mark Packard, showed small samples of their product, the idea being that the many well-distributed users were a better advertisement than a large space with many glittering lights, uniformed attendants, etc. A line of grease was also shown, including the Packard universal joint graphite grease, non-flowing gear compounds, etc. The exhibit which attracted the most attention, however, was the famous, but high-priced crystal oil, first manufactured regardless of price for the Locomobile racing car, but so good that quantities of it were sold at first at $2 per gallon. Later an increased demand allowed greater production, which in turn allowed a big reduction of price down to a figure but slightly above the regular price of other oils.

N. Y. and N. J. Lubricant Co., New York City.—The well-known brand of non-fluid oils formed the basis of this exhibit, but the most interesting feature was perhaps the showing of the new Motorol brand of cylinder oil, exhibited for the first time. This is made in four grades: extra light, light, medium and heavy. A special non-fluid oil is shown for use in water pumps. This is a special waterproof production with a high melting point.

Keystone Lubricating Company, Philadelphia, Pa.—Grease, grease everywhere, but not a drop to drink! It is to be hoped at least that no one tried to drink, eat or otherwise dispose of any of the Keystone greases, good as they are for an automobile. Two grades are made, and both were well shown at the Palace exhibit. The No. 1 grade is solid for use on grease cups, axles, pumps and other places where a solid lubricant is advantageous. No. 2 grade, on the other hand, is but semi-solid for transmission and differential cases, but is fluid enough to allow of its use in grease and oil guns. The quality of this grease cannot be shown in any exhibit, actual use being necessary only to prove their statement that a pound of it will outwear three or four pounds of a cheap grease or five gallons of an inferior oil. Grease cups in all commercial sizes completed the exhibit.



LUBRICATORS.

McCord & Co., Chicago.—Prominent on the stand of McCord & Co. is a recently developed device styled a class O lubricator, which is designed to give constant sight feeds on the dash, without the necessity of the oiler itself being located there, or the alternative of two lines of piping for each sight feed up to the dash and back to the lubricator. This design attaches to the engine side of the dash with the sight feed projecting through. It is driven by a vertical shaft connecting with the camshaft of the engine, which method of driving, however, can be varied to suit different requirements. Originally the company had intended to get this oiler to draw its supply from an auxiliary tank by means of the combined suction stroke of the small plungers. Experiments, however, demonstrated that this proposition was too delicate for general use.

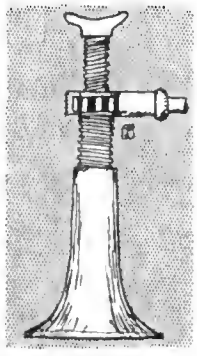
OIL GUNS, ETC.

Garage Equipment Co., Milwaukee, Wis.—The Perfect combination oil and grease gun is featured on this stand. The device is made of heavy seamless steel tubing with malleable iron top and bottom, while heavy leather washers are used in the plunger as a packing and on the pump between the cap and barrel. When the gun is used for grease it is operated by means of a crank. A gear on the crank is thrown in the mesh with a rack on the pump plunger, and it is operated by turning the crank, this securing a very high pressure. When it is used for oil the gear is slid out of mesh with the plunger rack and the plunger worked up and down in the usual manner. This gun also can handle gasoline.

Randall-Faichney Company, Boston.—Three new sizes of oil guns are ready for this year: a 5-ounce Broadway type, a 5-ounce Back Bay, and a 9-ounce Boulevard. The company is now making and marketing the Webster gasoline gauge, which consists of a hollow ball float resting on the top of the gasoline, and communicating with the dial through a miniature bevel gear on the opposite end of the float stem, meshing with a spur pinion on the lower end of the vertical shaft carrying the indicating needle. The gauge can now be attached without solder.

TOOLS FOR THE AUTOIST IN PROFUSION

W. M. Briggs, New York City.—As representative for a number of tool makers, W. M. Briggs has on exhibit a full line of jacks, tools, and garage equipment. The Joyce-Cridland telescoping jack has some features which single it out as worthy of



Joyce-Cridland Jack.

attention. It is designed on the double-screw principle, with both the right and left-hand screw working at the same time by the use of a ratchet handle. When down, the height is nine inches, and it has a capacity for three tons.

Coes Wrench Company, Worcester, Mass.—After seventy years of experience in the field of wrench making, the Coes company should be in a position to know something about how a serviceable wrench ought to be made, and the new line for 1909 clearly indicates that even if it is getting into a class ordinarily termed "has beens," where age counts, it will not apply to this firm. Good wrenches are an absolute necessity in the tool kit of an automobile, and the growing demand for those of Coes manufacture shows that they have withstood the hard usage to which wrenches are always subjected.

Elite Mfg. Company, Ashland, O.—"By all means get the best jack you can." Naturally working along these lines a very excellent product is the result. This, the "Reliable Jack," is simple, has very few parts, is strongly constructed, reverses readily, is clean to use, and has numerous other good features, which space will not allow mention or description of. This is a screw jack, the screw being turned by a bevel gear, and rotated by the hand lever which works like a ratchet. These jacks are made in every size and capacity up to 10 tons.

Perfection Wrench Co., Port Chester, N. Y.—The absence of "back lash" in the Perfection wrench is one of its advantages, but it has so many good features that it will be out of the question to do more than call attention to the fact that the wrench can be seen at the show. It will be remembered that this is the wrench which takes the place of a whole kit of wrenches because it is a combination wrench, including the features of a "monkey" and a "Stilson."

Quincy, Manchester, Sargent Co., Plainfield, N. J.—Tools which are designed to meet the various uses demanded in automobile construction are always a handy thing to have in the kit. This company hit the nail squarely on the head with its Auto Cle wrench, and now comes forth with a junior edition, the Titus Cle, which will probably prove just as useful. This smaller set is furnished complete with handle and set of sockets carried in a small, compact canvas case, which will well repay the initial expense.

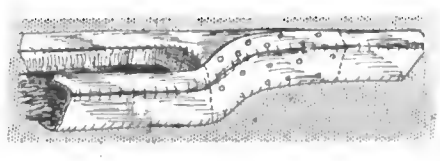
ACCESSORIES FOR EVERY POSSIBLE NEED

Austro-American Separator Co., Cleveland, O.—No-Shamy is the name given by the Austro-American company to its gasoline and water funnels, which are to be displayed. As its name indicates, this funnel may be used without chamois, it being claimed that this device separates all water and dirt from the gasoline and prevents it from going into the tank. This is accomplished by means of a double separating process. The automatic separator is installed in the gasoline line, under the footboard of the car between the tank and the carbureter, and it is said that even if the tank is full of water not a drop can reach the carbureter.

Brandenburg & Company, New York City.—This firm's large space is devoted to large things handled by them, as engines, metal bodies, lubricators, etc., so that one interested in wind shields had to look carefully to find it. However, the Ross & Browne shield, which the firm handles, is well worth the search. As shown, it is carefully made of mahogany, brass bound, with plate-glass, and divided just below the line of vision. An unusually stout construction held the upper part up in place, without rattle or jar, and yet was easily and quickly loosened when it was desired to have the glass dropped down, a pair of large milled head screws of brass being the whole operating mechanism, which in itself is simple and effective.

Caloris Mfg. Company, Philadelphia, Pa.—This caloris or vacuum bottle for retaining heat or cold, according to which is desired, has a new feature in that the construction is such as to be practically indestructible. This is secured by making the inner glass bottle separable from the metal case, the bottom of which screws out and carries a spring base. Besides this spring a pad or cushion is used, which rests upon the spring, the bottom of the bottle in turn setting on this. By that method the bottle may be handled very roughly without danger of breakage, in which unexpected and rare event the whole bottle need not be returned to the factory; simply write for a new interior glass portion. For those who prefer it, the bottle may be had with a wicker jacket, which is much lighter than the metal and not so fragile. The efficiency of these were being demonstrated by ice and hot water.

Gemmer Manufacturing Co., Detroit, Mich.—The importance of "steering gear" is well understood by all who may have given the matter a moment's thought. However faithful the pilot, it counts for



Reinforced Chadwick Frame.

naught if the "wheel" fails to command, and "lost motion," next to a wheel adrift, is the bane that leads to the "mahogany." The Gemmer is well represented, and the fitting qualities of the "Gemmer" are clearly portrayed. The double screw idea with means for adjusting to compensate for lost motion is of the greatest value, which, along with the fine materials used in the type, goes the greatest possible distance in the direction of safety.

Gloversville Auto Glove Company, Gloversville, N. Y.—The Ideal Separable glove, for instance, is a new idea, two gloves in one, normally fastened together, but separated at will. The outer is a hard service leather envelope with no opening in front, but fastened at the wrist by means of a strap and button. The inner real imported Angora glove is for warmth and has a double wristlet wrist of extra length. Either may be worn alone or when both are worn together if wet they may be separated and quickly dried. Besides, a full line of excellent gauntlets is displayed. All gloves have the seam on the side and not on the under part of the thumb, where the hand grasps the steering wheel. These gloves are all sewn with "C" silk, no thread being used, and they may be had in any of the popular colors. The cuffs—so important to the automobile driver—are all made of solid leather, on M. W. M. design.

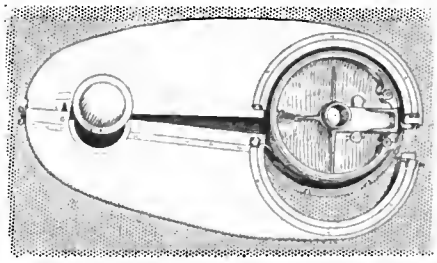
Hydraulic Oil Storage Co., New York City.—The garage system evolved by the Hydraulic Oil Storage Co., is designed to eliminate all gasoline valves. This system, known as the Snell Hydraulic, is based upon the difference in the specific gravity between gasoline and water, and the fact that they do not mix. The tank always is full of liquid, and the fact that there is no air to come into contact with the gasoline prevents a loss by evaporation and protects the tank from possible explosions by fire, electric spark, or lightning. In order to prevent water or dirt being drawn in, the clean oil is drawn from the top of the tank above the water head.

High Wheel Auto Parts Company, Muncie, Ind.—Of absorbing interest to manufacturers, or more particularly assemblers of high wheeled motor buggies or small runabouts, is the complete exhibit of this concern. The principal showing is of the "Wide Range" transmission jackshaft, which could be arranged to be used as a rear axle also. It consists of a two-speed planetary transmission arranged with a shaft encased in a tube. Intended for 10 to 18-horsepower, the sizes of the members, bearings, etc., are large enough to allow a proper margin of safety at the upper figure. Numerous other similar types are made, and the transmission and shaft can be had separately if so desired. In addition, brakes, differentials and other parts are shown.

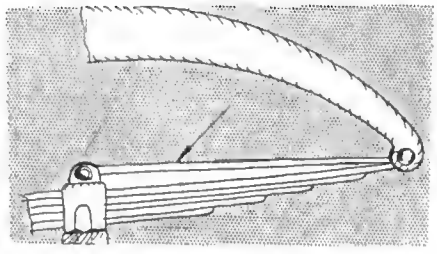
H. & C. Bottle Mfg. Company, New York City.—The comfort of the drinkers, hard, soft and otherwise, was carefully looked after by these manufacturers of the "Janus" vacuum bottle, when they provided a bottle that can stand an excess of hard usage without in the least endangering the glass interior. This safety is accomplished by the liberal use of rubber, the bottle proper resting upon a pad of it. The makers guarantee the strength, workmanship and durability of the "Janus" to the extent of replacing the whole or any part within sixty days of its purchase. This is the best evidence of its quality, for if it wasn't well made the makers couldn't afford to guarantee it.

Motor Accessories Co., New York City.—This company has on show a full line of accessories of the class now in brisk demand, and it is apparent from an inspection of the accessories offered that the wants of autoists will be well cared for in the hands of this well-known company. All the devices necessary to safely care for gasoline will be found in the list, and the M. & S. magneto is also handled by the company.

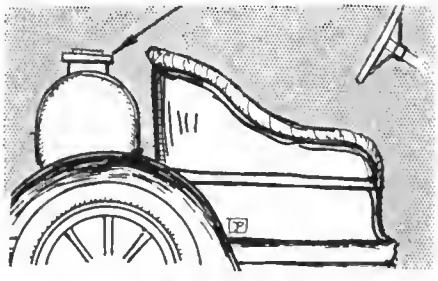
Motsinger Device Mfg. Co., Pendleton, Ind.—A new combination cut-out valve capable of cutting out the muffler and blowing a horn was exhibited by this concern. The housing containing it is a tubular cross, two opposite arms of which are equal in diameter to the exhaust pipe and threaded to be screwed into the exhaust pipe. The other arms are of different size, that for the whistle being the smaller. Guarding the entrance to these arms are sector-shaped valves rocked by two levers, permitting a separate cut-out and horn control, or both could be in operation at the same time. Also new is the switchboard used for battery charging from the Motsinger igniter. The switch has a three-fold control to allow for charging from the igniter, to run direct from the igniter, or to run from the battery.



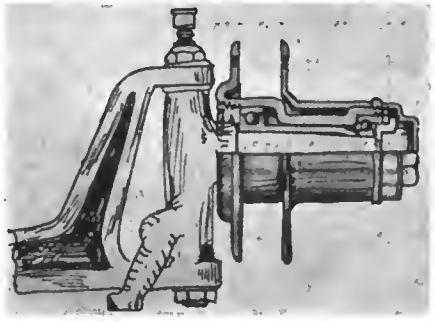
Chadwick Side Chain Boot.



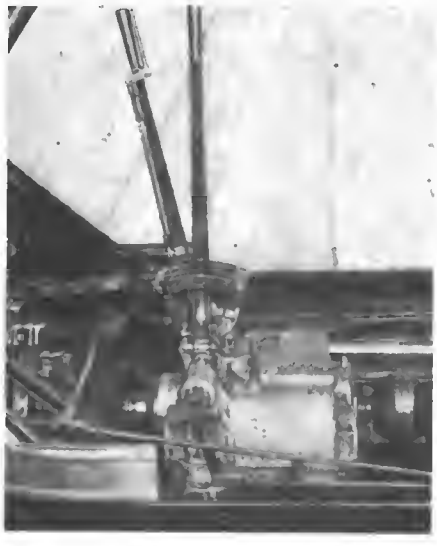
Chadwick Front Spring Spacer.



Chadwick Gasoline Tank Filler.



Hess-Bright Ball Bearing Hub.



Rockwell Removable Transmission

Raimes & Co., New York City.—The metal polish handled by Raines & Co. is displayed plenteously. In decorating its booth a huge fac-simile tin is used of its Globe liquid polish, five feet high and mounted on a pedestal surrounded by dummy tins of all sizes in both paste and liquid form.

Royal Equipment Co., Bridgeport, Conn.—Besides the well-known brakes for automobiles, this exhibit consists of brake linings. The principal one of these is that which is known by the trade name of "Raybestos," which consists of a wire-woven asbestos tape made from the highest quality asbestos. The belting, for it assumes that form, is made in one integral part or it may be had stamped out for disc clutches, the stamping in no way disintegrating the fabric because of the copper alloy wire freely used in the weaving. Its use is economical because it does not easily burn out or carbonize under the most intense heat. The coefficient of friction is high and it wears for thousands of miles.

John S. Wilkinson, Newburgh, N. Y.—To thoroughly enjoy the advantages which are afforded by owning an automobile, one should have the proper clothing, especially in winter and stormy weather. This company carries a complete line of fur coats, robes, gloves, etc., which are worth looking at. The double plush robe, 54x72 inches, with a rubber inter-lining, furnished with or without muffs, is particularly adapted to automobile use.

SPARE WHEELS

E. T. Burrowes Co., Portland, Me.—As a spare wheel proposition the Burrowes is one now much in use, and, contrary to the predictions of "wiseacres," the spare wheel scheme is spreading like "wildfire." The extra shoe and the tube within is protected while not in use, and when it does become necessary to change, the amount of work to be done is reduced to a minimum.

Spare Motor Wheel Co. of America, Chicago, Ill.—This concern, manufacturers of the well-known Stepney spare wheel, are almost too well known to need mention. This device for helping to save time, when the ever occurring tack or blow-out appears, is simply a standard clincher rim, without the hub or spokes, having four clamps for securing it to the rim holding the injured tire.

Annual Show Luncheon of the American Motor Car Manufacturers' Association, Held at the Hotel Manhattan, Tuesday Noon, January 5.

THE ANNUAL A. M. C. M. A. SHOW LUNCHEON

MOST successful yet of its annual show luncheons was the usual function of the A. M. C. M. A., held Tuesday noon at the Hotel Manhattan, with covers laid for some 200 participants. Benjamin Briscoe, chairman of the association's committee of management, and H. O. Smith, chairman of the show committee, flanked Job E. Hedges, the effervescent toastmaster of the occasion. R. M. Owen, S. H. Mora, E. R. Hollander and D. J. Post were other committeemen in evidence at the speaker's table, with Alfred Reeves, the general manager, modestly seated down the line. Others at the center board were Roger B. McMullen, the former general manager of the association; H. S. White, president, and Peter S. Steenstrup, secretary, of the Motor and Accessory Manufacturers; James Couzens, former chairman of the committee of management; Robert Lee Morrell, representing the Automobile Club of America; F. H. Elliott, secretary, American Automobile Association; Jefferson deMont Thompson, ex-chairman A. A. A. Racing Board; A. R. Pardington, general manager Long Island Motor Parkway; Henry Ford, R. E. Olds, J. D. Maxwell, W. C. Marmon, W. H. Van Dervoort, G. Vernon Rogers, R. A. Parker, J. B. Prindle, Horace DeLisser, Henry M. Duncan and Marcus Nathan. Scattered about the room were many notables of the trade and sport, F. B. Hower, chairman of the A. A. A. Contest Board, being one of these.

Following the facetious introduction of Toastmaster Hedges, Chairman Briscoe indulged in a little humor himself and then developed seriousness as herewith presented:

What Chairman Briscoe Had to Say.

I would, did it not appear vain, congratulate the entire automobile industry on the great success of this show, but just bear with me when I say, "they have got to go some to beat it." (Applause.) Surely it is, in attendance, in business interest manifested, in completeness of preparation, one of the greatest automobile shows ever held in this country. (Applause.)

Publicly I want to thank the Show Committee members, Messrs. Smith, Hollander, Post, Owen, and Mora, for the good work they have done.

I feel impelled also to voice the most universal thought held in connection with this show. I will lead up to it by saying that we all know that it is a more valuable attribute to be able to pick "good ones" than to be "good ones" yourselves, and by that token does the Committee of Management of our association shine in at least one particular, for it picked not only a "good one," but one that makes good anywhere you put him, a manager six and a half feet tall in sincerity, in judgment, in intuition, and in energy, and all else that goes to make a true, a noble, and an efficient man. Mr. Manager Reeves, on behalf of this association and on behalf of the exhibitors, I thank you most heartily.

I never participate in any gathering of men in this industry, representative of all its branches, but that I congratulate myself at being among them, and that together it has been our privilege to be the pioneers of the automobile. For this industry is even now but in its industry, and it is we who are having its early burdens to carry and who are making the experiments and the sacrifices of pioneership.

In time to come, say fifty or one hundred years from now, when the apex of its development will have been reached—when the automobile will then have been so long a universal thing that those generations will not even stop to think or to be concerned about where and how it came—when we who are here now will but exist only in the memories of the oldest inhabitants, and when whatever fame we may have been possessed of may rest only as it is chronicled in the dusty and brittle pages of those few copies of the trade papers which may have perchance survived the ravages of time—then, gentlemen, where'er our spirits dwell, they may be justly proud (were such a mortal attribute still possible with them) of having dwelt within our earthly selves, and that we helped according to our ability and our inspiration in these, the early stages of the development of the automobile.

For it is good work we are doing—a worth while mission to accomplish. 'Tis true we are but plain business men, yet this particular work has been given us to do: to pioneer one of the greatest complements of civilization. The greatest economizer of time since the telephone and the telegraph; the greatest lifter of man's burdens since the steam locomotive, for truly it is, as Macaulay says: "Of all inventions, the alphabet and the printing press alone excepted, those inventions which abridge distance have done most to advance civilization."

Busy as we are, then, gentlemen, it is well for us to stop often and consider the important part that has been given to us to play in the drama of life. The more we do, the broader and less selfish men we will be, and the more and more will we grow into an appreciation of our true responsibilities, and especially of the co-operative relationship we bear toward one another.

We must not allow ourselves to think loosely of the part our neighbor plays, nor to uncharitably criticize or gossip of his works or his errors, but we must push forward, shoulder to shoulder, as pioneers should, remembering that though various are our talents, yet have we all our own particular colors to brush upon the picture, and that as our hearts and our minds are, so will that picture be of our life's work, as perfectly and as beautifully done as we ourselves may make it, and as our inheritance to posterity.

Chairman Smith on the Show Question.

Next came H. O. Smith, chairman of the show committee, and among other things he said:

I cannot refrain from comparing this gathering with another held four years since at the Bresiin Hotel, with a total attendance of four. I refer to the first meeting which had to do with the forming of the American Motor Car Manufacturers' Association; and yet if we reflect, we will see that the growth of this association has been but a few years.

While this industry has already taken a position of prominence among the first in the country, who would attempt to predict its limitations five or ten years hence? The automobile shows have unquestionably supplied their part in the great march of progress. While it is a fact that most practices employed in the modern motor car are old mechanics, being merely put to new uses, yet experience was necessary to guide the builders in determining the conditions to be met and the best way to overcome the obstacles.

The shows have proved a clearing house for ideas, until to-day, with the wonderful fundamentals characterizing each type, we can agree that we have gone far toward standardization. The shows have also had the effect of not only interesting the public in motor cars, but impressing the importance and magnitude of the industry. May I add, in conclusion, that the management feels grateful to the exhibitors, the dealers, and patrons who have contributed to the success of the Ninth International Automobile Show and made it the greatest ever held in point of attendance, general interest, and actual business transactions?

S. H. Mora, another member of the show committee, interested his hearers and told of the unsought "honors" which come to a hard working member of the show committee.

Robert Lee Morrell spoke for the Automobile Club of America, he being one of its vice-presidents. He expressed the opinion that the show was the best one of its kind the city had ever seen, despite the fact that it was the first year in which the A. C. A. had not been identified with such an exhibition. He told of the efforts of the club in desiring to better automobile conditions generally.

Henry M. Duncan supplied humor which met with considerable success at the hands of his hearers.

All around, the affair was enjoyable, with just about enough talk to satisfy those present.

CROSBY NOW PRESIDENT A. A. C. OF N. J.

NEWARK, N. J., Jan. 4.—The Associated Automobile Clubs of New Jersey held their annual meeting Saturday night at the clubhouse of the New Jersey Automobile and Motor Club, the election of officers resulting as follows:

President, W. Clive Crosby, of Orange; first vice-president, Walter E. Edge, of Atlantic City; second vice-president, E. H. Radel, of New Brunswick; secretary and treasurer, Horace A. Bonnell, of East Orange.

There followed a conference on the legislative situation, though nothing was announced concerning it through the usual channels of publicity. The impression prevails that some modifications of the present unsatisfactory law will be obtained before the Winter session of the legislature is over.

Besides the "trapping" abuses, the lack of reciprocity with other States in registration is the particular phase of the present law which excites the greatest antagonism.

Members of the Society of Automobile Engineers Assembled in the Dynamometer Room of the Automobile Club of America.

AUTOMOBILE ENGINEERS MEET AND ELECT NEW OFFICERS

By CHARLES B. HAYWARD.

AT the fourth annual meeting of the Society of Automobile Engineers, held at the Automobile Club of America, Tuesday, the following officers were elected for the coming year:

President, Henry Hess, Hess-Bright Manufacturing Company, Philadelphia; first vice-president, Russell Huff, chief engineer of the Packard Motor Car Company, Detroit; second vice-president, B. D. Gray, chief engineer of the American Locomotive Company, Providence; treasurer, Allan H. Whiting, New York.

The two managers for the term of three years to fill the vacancies expiring at this meeting are David Fergusson, chief engineer of the George N. Pierce Company, Buffalo, and Prof. R. C. Carpenter, of Cornell.

Despite the unpleasant weather, the largest number of members of the society that has ever attended a meeting convened at 10 o'clock in the morning. It was the fourth annual gathering, and the prospect of having an opportunity of inspecting the club's fine dynamometer proved an attraction to many of the members from the West. By 10.30 there were 80 members on hand, and the morning session then began, with President Thos. J. Fay in the chair.

The first thing on the program was an inspection of the dynamometer, an explanation of its construction and workings being given by Henry Souther, a member of the society, and the chairman of the A. C. A. technical committee. After having detailed the operation of the various parts of the apparatus at length, a Pierce Great Arrow 6-60, 1909 model, was run upon the rollers, through the courtesy of Chief Engineer Fergusson, of the George N. Pierce Company.

Owing to the large number in attendance, which made it difficult for more than a small part of the members to observe the action of any one of the recording instruments, with the exception of the huge chart, it was deemed inadvisable to attempt to carry out a regulation test, so that after the car had been run at various speeds and loads simply to illustrate the operation of the dynamometer as a whole, a 10-minute test on the high speed was made, the car showing 44 horsepower at a speed of 46.2 miles, the drawbar pull of 355 pounds indicating that the load applied by the hydraulic brake on the drums gave the equivalent of a grade slightly in excess of 10 per cent. The members then adjourned to the floor below for an inspection of that part of the apparatus situated below the floor on which the recording instruments are placed. This consists of the drums, the hydraulic brake, and an electric motor, all mounted upon the same shaft, which is carried on large annular ball bearings to minimize the friction losses at that point, making the error in readings on that account practically a negligible factor. The electric motor is employed to run the drums when it is desired to measure the friction losses in a car.

Following this, the members adjourned to the reception room on the main floor of the club for an informal discussion of the dynamometer and its operation, as well as the value of its records. Numerous points were taken up, but the discussion chiefly bore upon the factor of power loss due to the tires alone. Not only tires of different makes, but different tires of the same make will be responsible for varying percentages of power loss at the driving wheels, while different types of tires of the same make, such as the round and flat tread, introduce a further variable, so that the tire factor in this connection was very aptly described by Mr. Souther as a "multiple variable." It has long been well known that tires were responsible for a difference in the mileage of an electric vehicle, frequently amounting to as much as 60 per cent., where a specially light, single-tube type was employed, as compared with what is known as the regulation "gasoline" type of tire, i.e., one consisting of a separate tube and a heavy outer shoe. The use of any form of non-skid device, such as studs of any nature, is responsible for a further

increase in the power loss at the road wheels, a series of tire tests now being carried on by Mr. Souther showing that the amount absorbed at this point ranges as high as 2.5 horsepower per wheel in some cases, and drops very low in others, although as yet there has not been sufficient time to test more than a limited number of types.

It was contended by some of the members that this extreme variation in the power loss due to different tires was likely to render the dynamometer readings of very uncertain value as records of the transmission losses in a chassis, and that the only way of overcoming this would be to mount the same tires successively on the rear wheels of the cars under test in order to obtain a constant. But a further difficulty crops up there in that the wheel diameters vary and that this introduces a further variable in that the loss is decreased with the increasing diameter of the wheel, besides being altered by differences in the cross section of the tire.

The discussion was very general, and during the course of an hour or more a great many points of interest were brought out in connection with tests on the club dynamometer, as well as with regard to tests generally. Owing to the temporarily enforced absence of Mr. Souther, his assistant, Mr. Chase, took his place in the discussion.

An adjournment was had for lunch about 1 P. M., which was served at the club, and immediately upon the conclusion of this the business meeting was called to order by President Fay. The report of the finance committee for the previous year was then read by the treasurer, Henry Hess. It showed the society to be in a most prosperous condition, its income for 1908 being close to $8,000, whereas for 1907 it was less than $1,500.

In the absence of the chairman of the membership committee, the report of the latter was read by Secretary Hayward, and it revealed a correspondingly great amount of progress, the membership having jumped from 116 at the end of 1907 to 280 at the close of the past year.

The report of Chairman P. M. Heldt, of the committee on professional papers, was also read by the secretary. During the past year no less than 19 papers have been prepared and read at the four quarterly meetings, but difficulty has frequently been experienced in getting them ready on time, due to members either not fulfilling their promises to supply copy and illustrations at a certain date, or, what has been equally frequent, not at all. This was followed by the report of the secretary, giving a general résumé of the activities of the society during the year just past, and dwelling particularly upon the establishment of the society's employment bureau. Considerable attention was also devoted to the matter of a more generous response to the call for papers than has hitherto been the case, the suggestion of Mr. Heldt that it be made a feature of the dinners held in connection with the society meetings to call for suggestions for new papers being heartily seconded. The reports of the various committees were approved as read, and it was decided that they be published in the following issue of the transactions.

President Fay then appointed Joseph Tracy chief teller of election, with Alexander Churchward, Henri G. Chatain, A. Bergman and J. G. Crowley as assistant tellers, to count the ballots cast for the nominees for offices falling vacant at the fourth annual meeting. Mr. Tracy announced that a total of 88 ballots was cast, of which five were void, the remainder being straight tickets, so that the election was unanimous.

President Hess then took the chair, and the paper on "The Modern Trend of Brake Design," by Lawrence Whitcomb and Thomas J. Fay, was read by Mr. Fay. A number of interesting points were brought out in the discussion, which lasted considerably more than an hour.

"What Constitutes Ignition Reliability," by A. Atwater Kent, was then read by the author, and during the course of the reading of his paper Mr. Kent illustrated, by means of an apparatus which he had constructed for the purpose, a number of the points dwelt upon in his paper, showing in a striking manner the contrast between the duration of the contact dwell of the ordinary form of roller timer and that of the Atwater Kent contact maker, as well as the lag at various speeds. A lively discussion ensued, and, as is always the case where the subject of ignition comes up, many questions of general interest apart from the subject as treated by the paper were brought up. Chief among these was that of the advantage of a fixed point of ignition, as compared with provision for advancing or retarding the time of ignition, a paper being promised on this subject for the first quarterly meeting of 1909 at Boston.

At 7 P. M. the members sat down to the annual dinner of the society, which was served by the Automobile Club, and upon the conclusion of this an adjournment was taken to Tuesday, January 19. A vote of thanks was tendered the club for its hospitality.

On that date members will again meet at the Automobile Club at 10 A. M. for a session with the club dynamometer, following which the technical sessions will be held in the Engineering Societies' Building, in Thirty-ninth street. The papers to be read are: "The Economics of Weight Reduction," by F. D. Howe; "An Improved Type of Compression Coupling," by W. S. Noyes; "Standardizing Motor Bearings," by S. P. Wetherill, Jr.: "Some Practical Considerations in Autogenous Welding," by Henry Cave, and "An Indicator with Continuously Rotating Drum," by S. W. Rushmore and H. L. Towle.

Among those present as shown by the register were: A. Atwater Kent, E. T. Birdsall, A. L. Riker, H. M. Swetland, David Fergusson, Thos. J. Fay, Lawrence Whitcomb, Henry Hess, Prof. R. C. Carpenter, Prof. F. R. Hutton, H. Vanderbeek, A. H. Raymond, Ernest L. Smith, René M. Petard, Amasa Trowbridge, Chester E. Clemens, Charles B. Kirkham, H. H. Brown, Louis M. Pawlett, Henri G. Chatain, H. F. Donaldson, Henry Souther, Alanson P. Brush, J. W. Bate, Joseph Tracy, J. A. Anglada, Alexander Churchward, H. L. Towle, Dempster M. Smith, Charles Cuno, George C. McMullen, Charles E. Reddig, W. R. Hudson, C. E. Davies, B. D. Gray, Lindley D. Hubbell, Julian Chase, M. R. Hutchinson, W. B. Hasselkus, Al C. Bergman, Frederick Charavay, E. S. Foljambe, Marcel de Jarny, E. W. Winans, B. G. von Rottweiler, A. L. McMurtry, Raymond Cilley, M. S. Young, Henry Cave, H. K. Holsman, R. E. Northway, Ernest Wilcox, W. G. Wall, W. T. Powers, William Herreshoff, Clarence E. Whitney, R. S. McLaughlin, P. M. Heldt, J. G. Crowley, M. C. Krarup, E. F. Schnuck, C. B. Hayward and a number of guests.

SILENT KNIGHT IS COMING HOME.

Within a fortnight it is expected that one of the new Daimler demonstrating automobiles will arrive in America, and the fraternity will have a chance to gaze upon the latest phase of the "Silent Knight" motor, as it is now being used in Daimler cars. One of the make is now in the country in the hands of a private owner. D. W. Whitford, until recently connected with Palmer & Singer Company, but now associated with K. Mandell, of K. Mandell & Company, exporters and importers, at 79 Worth street, New York City, is to manage the agency. While the Knight motor will be the "novelty" in the 1909 British Daimler, the fact that wire wheels are used will attract more than a little attention in this country. As respects the Knight motor, it will be remembered that it is an American invention that drifted across, after a trial here that did not seem to make a commercial go of it. Some changes have been made.

WRIGHT HOPES TO SAIL FOR FOUR HOURS.

LE MANS, France, Jan. 2.—Wilbur Wright gave his last airship demonstration here to-day, carrying with him in four different flights members of the Aero Club of Sarthe. Mr. Wright is preparing to proceed to Pau, where he will remain a month, giving instructions as to the handling of his machine. He then goes to the United States.

Mr. Wright said to-day that he expected at an early date to fly for more than four hours, and from 125 to 150 miles, by the use of new motors.

GENERAL GOSSIP OF THE PALACE SHOW

The First Automobile.—The old steamboat shown at the Maxwell-Briscoe commercial space caused many people to remark: "What is that old thing?" Now, it seems that the remark, particularly the "old" portion of it, was in good form, for this car was built in San Francisco in 1876 by a Mr. Wilkins. It is believed by the present owners, the Maxwell-Briscoe Motor Company, that this was the first gas-propelled vehicle ever built. As shown on another page, it will be seen to resemble closely the modern high-wheeler or motor buggy, with the exception perhaps of the "blinds" in front and the three seats.

Typographical Error.—In our large show issue of December 31, an error in the advertising of George A. Haws, manufacturer of the well-known Panhard oil, "put up in the checkerboard can," made it appear that this lubricant has been on the market since 1903, when the fact is that it was not produced until November, 1904.

Holsman Entertains Its Agents.—The Holsman agents in attendance at the show were entertained at a Sunday dinner at the Hotel Knickerbocker by the Holsman Company. Plans and policies for 1909 were outlined, and the new 26-horsepower, four-cylinder, all ball and bearing motor, was thoroughly discussed. This motor has aroused a remarkable interest among visiting agents and prospective purchasers.

Moon Very Busy.—The press of business at the Moon Motor Car Company's factory, at St. Louis, was so great that Stewart McDonald, vice-president and general manager, was unable to get away for the Palace show. New agencies, particularly in the Southwest, are so urgent that the factory must be pressed to its fullest capacity, and "Mac" had to stay home and do the pressing.

The A. A. A. Tour to Be in July.—Chairman F. B. Hower, of the contest committee of the American Automobile Association, announced Tuesday that the entry list for the 1909 A. A. A. tour, which includes the contests for the Glidden and Hower trophies, is now open and that the date of the start would be some time during the week beginning July 5. Chairman Hower and Secretary D. H. Lewis were visitors at the A. M. C. M. A. show in the Palace, but would give no information concerning the route or any further particulars of the tour. A fee of $200 will be charged for cars entered prior to May 15, and $300 thereafter until June 15, when the entry list will be closed. The temporary blank calls upon the entrant to state whether his machine is a touring or roadster type and the style of body, also whether it is entered for the trophy certificate or in the non-contestant class. An inventory of all parts carried must be furnished in addition.

Cork Inserts on the Job.—The Premier Century car, of which so much has been heard in the past half year, is at the show, and from all appearances and reports is ready at a moment's notice to repeat its 1908 century and other performances. This car's brakes are fitted with the cork inserts of the National Brake & Clutch Company, Boston, and it was the verdict of the judges who examined the car at the end of the century-a-day-for-a-hundred-days' performance that these brakes merely showed that they had been in use, so little did the cork inserts show the evidences of that furious test.

American Automobile Association, 437 Fifth Avenue, New York.—The booth of the A. A. A. was a rendezvous for visiting autoists from all parts of the country, the information sought in the majority of instances naturally being that concerning the holding of the annual "three A" tour for the Glidden and Hower trophies this Summer. Secretary Elliott was in charge to answer questions regarding the advantages of being an A. A. A. member, and numerous applications were received. Numerous pamphlets detailing the varied activities of the association were distributed.

Automobile Club of America, West Fifty-fourth Street, New York.—The club devoted its exhibit at the show, which is the first in which it has not participated in a managerial capacity, to the work of its touring bureau, of which Waldron Williams is the chairman. The bureau is actually in charge of A. L. Westgard.

National Retail Automobile Dealers' Association, Oshkosh, Wis.—One of the meetings held during the course of the show was that of the new organization of retail automobile dealers, which first came into existence during the Chicago show last year. The objects of the association are to better the conditions of its members generally and to place them on a better footing with the manufacturers, and the subjects discussed at the meeting were entirely on lines such as discounts, methods of selling, demonstrating cars, and the like.

International School of Aeronautics, Morris Park, N. Y.—There have been few shows which have not been productive of some entirely new form of exhibit as the result of developments either in automobiling or in lines associated with it, and the show at the Palace proved no exception, as may be seen from the present instance. Naturally such a school would not have a great deal to exhibit, apart from apparatus and photos of ascensions, but it was an interesting spot for a large number of visitors.

Big Smoker at the A. C. A.—Probably what was the largest crowd ever assembled in the home of the Automobile Club of America was that which attended the show smoker of Saturday evening last. The big assembly hall was filled to suffocation, and the smoke was so thick that it could be cut with a dull knife. Chairman Orrel A. Parker, of the club's entertainment committee, provided satisfactory enjoyment for those present.

The Assistant of the General Manager.—First the A. M. C. M. A. had to find a good general manager. Alfred Reeves got the job. Then the general manager needed a good right-hand man. Lee Myron Bradley secured the place. That he fills it exceptionally well has been apparent to all those who have come in contact with him before and during the show. Once upon a time he lived in Providence, and he is an ex-newspaper man.

Humphreys, Editor "The Missing Spark."—There's a very conservative and excellent paper called the New York *Evening Post*. It doesn't give its automobile expert any vast amount of space for his gossip of the industry and sport. Therefore, Major Humphreys periodically issues *The Missing Spark*, wherein he gives personal attention to his friends in scintillating paragraphs.

FRANCE WILL NOT HAVE ITS GRAND PRIX.

According to private information received this week from the Automobile Club of France, a sufficient number of entries have not been secured for the Grand Prix, scheduled to be run in the Château country in July. Only nine actual entries were made when the minimum required by the club was placed at thirty. Therefore, there will be no Grand Prix, and probably no Circuit des Ardennes and no Florio Cup race. Exactly what will happen now in foreign automobile racing remains to be seen.

FINAL PLANS FOR BUFFALO SHOW.

BUFFALO, Jan. 6.—The 1909 directors of the Automobile Club of Buffalo held a meeting yesterday afternoon, at which the 1909 Buffalo Automobile Show question was definitely settled. It is to be run by the Automobile Club of Buffalo, the week of March 1. The Buffalo Automobile Trade Association has been given the privilege of appointing one of its members, the trade interests outside to appoint another one, and the two to appoint a third person to form a committee of three.

Duryea Gasoline Buggy of 1893.
Single-cylinder friction transmission, electric ignition, spray carbureter, one-hand central control.

Winner Chicago "Times-Herald" Contest.
Two-cylinder, double gear drive, individual clutches, three speeds forward and reverse, artillery wheels.

Duryea Buggyabout, 1909 Pattern.
Two-cylinder, two-cycle, air-cooled, fitted with Duryea grooved roller drive.

AS IT WAS IN THE BEGINNING

By CHARLES E. DURYEA.

"WHAT started the demand for automobiles, and who first attempted to fill it?" Quite a natural question, but it is based on a misapprehension. Radical things are never demanded. Improvements are sometimes asked for, but the really great steps in advance are usually so far ahead of the public that they decry rather than ask for them. The first Jacquard looms were destroyed; harvesting machines burned in the fields; the telephone was laughed at as a funny toy; and the power vehicle, "Pooh! I prefer to drive something with life."

Such was the feeling of the public toward a self-propelled buggy during the '80s, when I was considering it most carefully. The idea was not a new one. It ran back beyond the dawn of history. Homer describes Vulcan's work for one day as "a full score of wheeled tripods, spirit moved." Many a modern factory would be proud of such an output. Time and again the problem was essayed by some venturesome mechanic or engineer, only to end in ridicule and failure.

About a century ago, when the new steam engine was being developed, many attempts at self-propulsion were made, and from 1820 to 1844 motor passenger vehicles and stage coaches were much used in England and carried thousands of passengers. The advent of the locomotive and restrictive laws drove the auto out of existence there, and left it for Germany, France and America to revive 50 years later.

With the expiration of the Otto patents on the four-cycle engine in 1886 there began a great advance in this type, and some very light ones were produced by Daimler and Benz in Germany and taken up by French makers in the early '90s and pushed so vigorously that all the world took notice.

About this same time I concluded the public would be ready to accept a power buggy by the time one could be perfected, and in 1891 I began work on a simple design, which followed horse buggy lines as closely as possible. It was my thought that a buggy which ate no oats and caused no expense when not in use could be sold to people unable to afford horses, and that the more closely it copied the horse buggy the better. A driver of horses during all my early life, I too, felt the love of the animal and did not believe that any one able to have the horse-drawn vehicle would care to use the machine. But I expected the low price and maintenance cost to go far toward creating a demand.

The first one, finished in 1892, was, like all first attempts, underpowered and given very little service; and so careful was I to avoid any more charges of lunacy than necessary, that it was not shown to many and was not photographed. It was partly rebuilt, and then abandoned to build an entire new rig, which was completed in September, 1893. This is shown in the accompanying photo and was finished before the product of any other present-day American maker had been begun. It ran many miles and opened a new era. It demonstrated that the power vehicle was superior to a horse-drawn one and that the market desired could be created among the wealthy if the product was superior. It was entered for exhibition at the Chicago World's Fair, but not exhibited because it was not the future immediate type.

Its successor, begun in the winter of 1893-4, was finished in the Fall of 1894 and was a modern automobile in that it had multiple cylinders, three speeds forward and reverse, transmission by gears, pneumatic tires, artillery hubs, water tank in front, engine shaft lengthwise the vehicle, throttle control, spray carbureter, electric ignition and many similar features, some of which its predecessor did not have. After a successful service during the summer of 1895, it was entered in the first auto event in America, the *Times-Herald* race at Chicago, on Thanksgiving Day, November 25, 1895.

This contest was an attempt to duplicate over the vile roads of America the splendid successes which the power vehicles of France had shown in a French race in June of the same year. Prizes amounting to $5,000 were offered and 83 entries secured. But the American winter was perverse and an unusual blizzard had buried the roads beneath 18 inches of snow, which on the morning of the race was covered with a frozen crust on which pedestrians walked and sleighs glided, while horses and heavier vehicles cut through. No wonder that but seven started in the face of this, and it is great wonder that any got through; but the Duryea won (first prize $2,000) and was the only vehicle to finish without being pushed or towed and the only one to leave and return to its garage under its own power.

The best German and French vehicles were entered, but only one, a Benz, was able to get through, winning the second prize. The prize winner was used for a year or so as a demonstrator, and then sold for $1,000 at second-hand and gave its buyer good service, a clear proof of the superiority of American autos even at that date. Its neat and graceful lines, as shown in the photo herewith, would not make it look out of place among some of the high-grade electrics of to-day.

But skeptical buyers could see no good at home. The faults of the foreign cars were not visible. And the gasoline car could not win popularity on its own soil. Foreign makers said, "We were beaten by the weather."

So when the first British run was announced, a Duryea rig took its position well to the rear of nearly thirty entries, including the three leading vehicles in the great French race of 1896 and the drivers that had run them to victory. The distance to Brighton was 52 miles, and the Duryea covered this so quickly

that it was ahead of the judges and assumed not to be in the race, having beaten the next vehicle by about an hour. This happaned November 14, 1896, in the "Liberty day Run," held to celebrate the legal victory which undid the oppressive law of 1844.

For years this unique victory of an American auto over foreigners on their own soil was the only instance of its kind, but not till American buyers and makers had gotten their fill of toy steamers and such follies could the gasoline vehicle come into its own. And even then it was necessary to go abroad for designs. Such is the peculiarity of human nature.

And the end is not yet. That vehicle which meets the needs of wealthy tourists in Europe is not the one for the great American masses. Thousands of small copies well made and very capable are being sold, but slowly the American public are learning by experience that their daily needs can be better served by reversion to the original type. The prejudice against power vehicles has been largely broken, the sanction of the leading classes has been gained, the auto has won its spurs and proven its ability at all seasons of the year.

The 34-inch and 38-inch wheels of the "London to Brighton" winner find their counterparts on nearly all the better autos at the 1909 auto shows, and one really wonders, "Why the small wheels of five years ago?" The absence of single cylinders suggests that the Chicago winner and its successors ought to have been followed. Other features could be mentioned, but the question is, "What is the lesson?" Simply this: The needs of the masses who could not afford horse-drawn vehicles in 1891 are still unsupplied in 1909. The masses to-day are rapidly beginning to demand the motor buggy or some power vehicle which will take the place of the horse vehicle so largely used. The conventional auto has required the most expensive selling machinery ever utilized to market any product, but as the public become convinced of the economy of the motor buggy, the demand will rapidly grow and the foresight of the prophets of 15 years ago will be fully vindicated in the very near future.

The number of motor buggies now being offered is rapidly increasing, some of them are exteremely simple and therefore almost certainly free from trouble. They are light in weight, economical in fuel, easy on tires and for speeds below 20 miles per hour are extremely satisfactory. They may be accepted as a very proper reversion to the original type in mind when the first autos were constructed.

CONCERNING NOISE AND ITS AVOIDANCE

By C. H. TANGEMAN.

"KNOWLEDGE" applied to automobile construction is the ability to design a chassis in which those features of construction that tend to noise are ingeniously dealt with, and the ability to assemble the parts of the motor and transmission in a manner which tends to produce the least noise.

In a car where construction details include the elimination of noise, as in the case of such cars as the Lancia, which we happen to handle, there are practically only two details to be considered: First, the motor; second, the transmission. In the motor are the valve lifts, which, actuated by camshafts, strike and then lift the valve from its seat. It can readily be understood how this process of striking of the valve stem, as with a hammer, produces noise. This can be eradicated only by reducing the blow to a minimum. In the Lancia this is accomplished by timing the valve lifts so that there is virtually no lost motion between the lift and valve stem. In a chassis recently arrived from Europe we found that even the thickness of a single sheet of cigarette (tissue) paper cannot be introduced between these two parts. When the lift, therefore, rises and strikes the valve stem, it has not as yet attained a great speed, as the cam is only commencing its lift; the blow is therefore very light and the noise consequently reduced to a minimum. As an illustration of the foregoing, try striking a nail with a hammer. When the hammer is held only an inch from the head of the nail less noise will result upon striking than when held a foot or more away and the nail then struck from that distance.

The only other noise connected with the motor is that of the exhaust gas. This subject, which must be carefully considered in designing the exhaust piping and muffler, is one which in the Lancia has been very satisfactorily treated, resulting in an exhaust pipe of unusually large size in a muffler much larger than has heretofore been considered necessary for a motor of the dimensions employed. The gas, therefore, expands freely and rapidly, and by the time it is discharged into the atmosphere the noise has been muffled or deadened by its extreme expansion. I do not believe that in any motor the noise caused by the explosion within the cylinders is heard by the riders in the car, or even by people passed along the road, except the motor is of very high compression and then it can only be heard when the car is at a standstill and the bonnet opened.

Taking up the transmission of the car, which is the only remaining source of noise, I contend that it is merely a matter of proper design, assembly and finish to overcome all noise.

There is no "trick" employed in attaining this most sought-for feature. It is merely knowledge of the causes of noise and then the ability to reduce it to a minimum. Absolute silence is an impossibility in the present practice of the art, but each year we acquire more knowledge and greater ability.

COL. CLIFTON ON THE RECENT PARIS SALON

"AS a demonstration of the discrimination of the American automobile buyer, the Salon was a marked success," in the opinion of Charles Clifton, of the George N. Pierce Company, Buffalo. Col. Clifton attended the annual exhibition at Paris and has just returned home.

"Ever since automobiles were first manufactured in Europe," Col. Clifton says, "the makers of France particularly, and Germany and Italy to a great extent, have depended on England and the United States for a market for a large part of their product. This foreign trade has encouraged them to make advances in construction and bring out new ideas. But this country and England have progressed now to a point where our practices are, at least, on a par with continental Europe. Discriminating buyers have come to realize that the car built in this country is suited best to the needs of this country. He realizes, too, that his American-made car answers his purpose in Europe as well as any European-made car. The consequence is that the encouragement they received formerly has been taken from the makers of France, Germany and Italy. Little has been done by way of improving their cars and bringing out new models.

"It would not have paid the automobile enthusiast to visit the Salon this year with the sole view of seeing new models. There have been no radical or even pronounced changes in construction. The automobile designer would have found less to interest him than at any previous Salon, although there were matters that would have caught his attention. These were principally in the way of new materials for certain parts and improvements in accessories.

"Altogether the Paris Salon gave the impression of being a striking illustration of the trend of American buying—the fact that the people of the United States are now buying cars made in their own country."

Matheson Gets Three Out of Four in Quaker Club Run

BY G. M. SCHELL

PHILADELPHIA, Jan. 4.—If Friday's and Saturday's performance of the contenders in the third annual New Year's run of the Quaker City Motor Club means anything, 1909 will be a Matheson year. Under conditions which precluded the possibility of all-round clean scores, the three Matheson entries finished 1-3-4; the Franklin "28," driven by C. S. Carris, capturing second place. A pair of Cadillac "30's," driven respectively by Edward Burnshaw and William Crawford, finished fifth and sixth—noteworthy performances, both of them.

The last-named car was the winner of the $500 side wager with the Class B Maxwell 24-28, driven by William Longstreth, the terms of the bet being that any car listed at $2,000 or under that would have a lower score than the Maxwell should scoop the pot. The Cadillackers called the defi, put up their $500, and suffered but 139 demerits, as against the 528 chalked up against the Maxwell. The winning car was F. M. Kirby's 45-50 Matheson, and the 11 points penalty was made up of one observer's demerit and 10 inflicted by the technical committee. Aside from this one point, which was garnered on the second day, the road work of the Matheson trio was perfect, the other demerits being made up of faults found by Chairman Swain's technical sharps.

Class B honors went to "Bill" Reuss's Peerless "30," a private car, as was also the winning machine in Class A.

The high totals in the checkers' penalty column are due entirely to Pennsylvania's icy mountains, and the bulk of them were accumulated almost before the contestants had a chance to warm up after the start from Wilkes-Barre. It was the famous old Giant's Despair which claimed victim after victim, and put them so far behind that each succeeding control only added to the totals of points. Some of the contestants, disgusted with their positions, failed to turn in cards, and came right through regardless of schedules. Others played the game out to the limit, took their medicine like little men, letting the points pile up as they might. Giant's Despair certainly took a cruel revenge for its Memorial Day buffetings of past years. Some of the cars unloaded their passengers to reach the top, and were disqualified therefor. Others hunted up block and tackle, or made a path of robes to secure traction on the slippery surface.

First - Matheson Tourer

Second - Franklin Tourer

First - Peerless Runabout

Second - Maxwell Runabout

But one car submitted to the technical committee came out unscathed—the Premier, driven by Roy McNamara. It is understood that the failure to consider that car's performance was due to the unloading of the car in order to reach the top of Giant's Despair. The Studebaker, the Franklin, the Oldsmobiles were among other cars which were penalized but lightly by the technical committee. The Stoddard Dayton's road and observer's penalties were due entirely to running shy of water in the radiator and the consequent delay in procuring the necessary aqueous in a houseless mountain district. The hot engine was responsible for some of the technical demerits. A succession of exasperating tire troubles was responsible for the accumulation of 648 checker's penalties by Frank Yerger's Studebaker "30," which had the fewest technical penalties of any of the cars which officially finished.

Considering the difficulties of the route, and the exceptionally adverse conditions, the almost utter absence of vital breaks—apart from those resulting from collisions—was little short of wonderful. Without exception, all the spills and collisions were due to the coating of ice which covered the hills, and which made the negotiation of turns at even medium speed a dangerous proceeding. The result can only be considered a triumph for American automobiles, for never were conditions worse for an endurance contest. Men and cars suffered alike. "Whisker coats" in many cases failed to keep their wearers warm in the frigid air and with a 20-mile head wind from the northwest, and on the last control of the first day a sharp snowstorm for an hour or so. Frozen cheeks and toes—not to mention bad cases of "cold feet" when cars began to slide backward on the mountain roads—were complained of here and there. It was a sure endurance run.

On the theory that "misery loves company," the colossus after whom

Senator Morgan named the Wilkes-Barre mountain road must have chuckled to himself as he witnessed the difficulties encountered by the 25 contestants remaining from the original field of 31 starters shortly after the start of the second day's trip. The surface of the steep and winding way was a sheet of hard, glassy ice, into which chains and anti-skids could not penetrate sufficiently deep to afford a firm hold for traction. The Wilkes-Barre Automobile Club had caused a few barrels of ashes to be scattered here and there on the turns. The straights were allowed to remain as the combination of a stiff grade, a six-inch snowfall followed by a thawing rain and then by a hard freeze had made them when the contestants tobogganned down the mountain the previous afternoon—perhaps that exhilarating sleigh ride had made Giant's Despair a trifle slippier, if possible.

The route out of Wilkes-Barre toward Hazleton, the first control, led directly up the mountain, and the first indication of what was coming to them was given the contestants when they heard that "Doc" Overpeck, in the Mitchell pilot car, finding he was ripping the chains off his wheels, and that his load of confetti was not sufficiently heavy to give his car traction, sidestepped the hill and sped Hazletonward over the much more practicable boulevard route. The contestants, however, could not follow the pilot's example; they were compelled to adhere to the official route or suffer disqualification. Cadillacs Nos. 2 and 3 had a slight advantage, and by picking the rough places here and there managed to reach the top after much difficulty. No. 4, a six-cylinder 45-horsepower Acme, was driven by Al. McCormick, and he had figured it out that his best chance lay in "rushing" the hill. His plan was working to perfection until, when two-thirds of the way up, he overtook Cadillac No. 3, which was creeping up as best it could, picking the rough going on either side of the road. Of course, McCormick had to slow down, for there was no room to pass. As the Acme lost way the rear wheels began to slip, and in a few moments the car was sliding backwards down the hill. Quickly a sprag was dropped, which held the car, but at each attempt to go forward the chains did nothing more than wear a pair of polished grooves in the hard ice as they whirred around. The crews of the Matheson, Nos. 6 and 7, immediately behind the Acme, knew the mountain thoroughly, and after sizing up the situation figured it out that they could just squeeze past the panting Acme by taking a chance; they took it, and won out. Shirk, in Stoddard-Dayton, No. 8, tried the same trick, but couldn't get around, and dropped back. Then a collection of robes was taken up from the string of stalled cars, and by pushing and pulling, and filling up the tonneau of the Acme with bystanders to put weight on the rear of the car, in order to make the chains "bite," the road was finally cleared. Those cars which were blocked on the stiffest grade were compelled to drop back to a place where they could get a chance to get up a little headway. It was a good hour and a half before the last car had mastered the icy slope. Despite the 15-degree temperature, the air was kept warm with imprecations, and it will be many a long day ere the memory of that early morning struggle with the slopes of Giant's Despair and Jack Frost fades from the memory of the participants.

In this connection it is proper to point out that the contest committee, a few days before the run, had inserted a new rule in the regulations governing the contest, allowing time to any car which might be compelled to stop owing to being blocked on a narrow road by another car in distress. The Acmeites claim that they were so blocked by the Cadillacs; that they had ample power, as witness the overloading of the tonneau to get traction. Those behind the Acme claim the latter was stalled, and some of the latter, when they tried to go forward, found it impossible to do so for awhile, and they came in for blame from those behind them. It was a case of "every fellow could have gone up easily if the fellow ahead of him hadn't stalled." The shower of protests hurled at the contest committee at the finish gave that body many hours of earnest discussion, which lasted well over into Sunday, and a decision was not made in time for the morning papers to publish the results.

Another knotty problem that the committee was compelled to solve was whether in case of a tie an engine stop of 30 seconds should be given a win over a similar stop of 45 seconds—observers' reports turned in at the end of the first day brought up the question. The rules say that a one-point penalty shall be inflicted for each such stop or fraction of a minute it continues. Another mix-up came as a result of the adoption of a schedule wherein the 20-mile-an-hour basis was reckoned out in the hours, minutes and seconds. The Cram and Freitag Mitchells, Nos. 9 and 10, claimed to have lost clean scores the first day by adhering to the printed schedule, while the finish officials were ignoring the odd seconds. No. 10 was given one demerit for crossing the finish line the fraction of a minute to the bad, whereas if they had been allowed the odd seconds the Mitchellites claim they would have finished clean.

A combination of unforeseen circumstances resulted in a dearth of accommodations for pressmen on the run, and as a result there was a rush for the 8:30 express as soon as the last Class B car had been sent away from the Hotel Walton at 8:02 A. M. The officials and the Fourth Estate men quite filled the only Pullman, and on arriving at Wilkes-Barre at 10 o'clock "The Automobile" representative and a photographer stole a march on the others by securing a Matheson tester and beating it for the Mountain House to snap the cars coming down Giant's Despair. After the pilots the first two to strike the toboggan were the Matheson duo, Nos. 6A and 7A. From the porch of the Mountain House could be heard the cannon shots which welcomed their arrival at the hotel a few minutes later. Wilkes-Barre is certainly loyal to its own.

The tenderness with which most of the drivers tackled the descent of the crack hill-climing course was remarked upon by the dozen shivering enthusiasts gathered at the windy lookout. The Mathesonites evidently knew their ground, for confidence was written on their frozen faces as they swung and skidded around the turns at a fair rate of speed. Out-of-towners felt their way cautiously. The observer in Mitchell No. 9, which slid down toward the Mountain House with wheels locked, lost his nerve and jumped from the car, and a couple of minutes were lost before he could be induced to get aboard again and continue the journey. No. 9 was penalized about that much at the finish for late arrival. Rambler No. 19 (Class A) began to coast with rear wheels set, all hands meanwhile looking as if they were prepared to jump. At the same time the car began to swing round, and, after making a full revolution and a half, stopped with front wheels in the ditch, completely blocking the road for the following car, which came within an ace of ramming the Rambler. Berger's 42-inch-wheeled Oldsmobile No. 23 (Class A) next in order took to the ditch to avoid a collision, and got into such a bad position that fully 15 minutes were lost getting the car back onto the toboggan again. Some of the rear cars came down the mountain after dark, but just how they did it they couldn't tell themselves. Joe Keir, who followed the run in an 18-horsepower Autocar truck loaded with Ajax tires, declares it came down sidewise and backward. It was 9:30 at night, and the only things to be seen were the lights of Wilkes-Barre down below.

Following is the schedule, showing the distances between controls and the time allowances:

FIRST DAY.

	Miles.	Time.	Total Miles.	Total Time.
Philadelphia to Sellersville	33.3	1:39:54		
Sellersville to Allentown	21.0	1:03:00	54.3	2:42:54
Allentown to Stroudsburg	49.9	2:29:42	104.2	5:12:36
Stroudsburg to Wilkes-Barre	50.1	2:30:18	154.3	7:42:54

SECOND DAY.

	Miles.	Time.	Total Miles.	Total Time.
Wilkes-Barre to Hazelton	36.9	1:50:42		
Hazelton to Hamburg	35.0	1:45:00	71.9	3:35:42
Hamburg to Reading	16.2	:48:36	88.1	4:24:18
Reading to Pottstown	16.7	:50:06	104.8	5:14:24
Pottstown to Norristown	19.3	:57:54	124.1	6:12:18
Norristown to Philadelphia	22.3	1:06:54	146.4	7:19:12

It was plain sailing on the first control, few of the cars failing to arrive at Sellersville with at least 15 minutes to spare. On the second control several stiff foot hills of the Alleghanics are en-

countered, and then began the series of accidents which gradually mowed down the list of competitors. At Centre Valley "Dan" Webster, driving an Oldsmobile "35" Class B roadster, skidded at the turn from the Bethlehem pike into the Allentown road, and came to close quarters with a telegraph pole, with the usual result, as far as the car was concerned, but with, fortunately, only a few bruises for his mechanician and a beautiful black eye for "Dan." The glasses which the latter wore at the time were not broken; neither were his goggles.

On Lehigh Mountain—one of the above-mentioned foothills—Bert Maucher's Peerless No. 1 (Class A) came to grief by skidding across the icy road and into a deep ditch, breaking a wheel and topsy-turvying the car. Apart from a severe shaking up for all hands, there were no ill effects suffered by the occupants.

After checking out of Allentown, Frank Hardart, Jr.'s, Elmore (Class A) was making excellent weather of it when in the outskirts of Bethlehem the chains failed to hold the car on the icy road at a sharp turn and the outfit rammed a house close to the roadside; it chopped off a portion of its porch as clean as a whistle. Again the car was put out of action and the passengers escaped without injury.

Five miles below Allentown, Franklin, No. 16 (Class A), driven by Ed. Luckenbach, turned turtle as the result of a skid on the ice, throwing all hands out and clear of the car. The result was a broken wheel and the destruction of the car's chances, but, again, fortunately, the hospital failed to corral a solitary victim.

The experience of J. A. Depew in his Winton (No. 11, Class A) gives a body blow to the pessimist who claims that the existence of the milk of human kindness is an ancient fallacy, and that it is not to be found in the market these days. In Easton, in order to avoid a woman, who suddenly stepped into the street directly in the path of his car, Depew chose to drive into the curb rather than hit her. The result was a smashed front wheel. Nearby was another Winton, belonging to an Eastonian, who insisted that Depew should take one of his wheels and continue, saying he could himself borrow a wheel in town and move along somehow until Depew could express him his wheel on his return to Philadelphia. Later, however, it developed that the collision with the curb had shaken up the car rather badly, for while tobogganning down Giant's Despair his shaft broke between the clutch and the transmission.

Another Winton, No. 17 (Class A), driven by Joseph H. Schenck, Jr., so strained its transmission in getting out of a deep ditch into which it had skidded at an icy turn that the last two-thirds of the journey to Wilkes-Barre had to be covered with the low gear, the result being 170 points penalty for being the same number of minutes behind its schedule at the finish.

Thus the completion of the first day's run saw only 12 of the 23 Class A starters remaining with clean road scores, and two of the eight Class B contingent—and of the 17 derelicts, six were entirely down and out of the running, the remaining 11 having suffered various penalizations for lateness at controls. For reasons best known to themselves, the committeemen refused to make known the technical penalties imposed upon the contestants.

The Wilkes-Barreans fairly outdid themselves in entertaining their guests. Besides an all-day lunch, there was a reception and smoker in the ballroom of the Hotel Sterling, with solid and liquid refreshments galore. Even the chauffeurs of the town took a hand. The drivers recently formed a club and established quarters at No. 45 Simon Long Building. Here they entertained visiting chauffeurs, clubmen and newspaper men, setting out a tasty lunch and smoke goods all the afternoon and evening. There are about 25 members in the Wilkes-Barre Chauffeurs' Club, and every man of them was on the job. President George P. Kessler was assiduous in his attentions to the many visitors.

How Latest Official Standing Was Arrived At.

PHILADELPHIA, Jan. 4.—The final standing of the contestants in the Philadelphia-Wilkes-Barre endurance run, as officially announced early Sunday morning, underwent a shake-up this afternoon, when a protest filed in behalf of the Oldsmobile (Class A) cars, driven by Folberth and Berger, and which were originally placed in eighth and tenth places, had the bulk of their road penalties lifted, and as a result moved up into second and third places, with 13 and 15 demerits, respectively. This dims the glory of the Matheson victory somewhat, although Miller, with but 11 bad marks, still heads the list. The Anderson and Dietrich Mathesons, as a result of the decision, are fifth and sixth, respectively, with Carris' Franklin fourth.

When Folberth reached the impasse on Giant's Despair he refused to take a chance of crippling his car by taking to the ditch in an effort to get around the stranded Acme. An eleventh-hour amendment of the rules had covered this contingency; it provided for the lifting of any penalties inflicted upon a car held up by a narrow road being blocked by a stalled machine.

The Oldsmobile case was reinforced by positive testimony of observers and passengers, and was such a strong one that the contest committee upheld the protest after but a few minutes' deliberation. Final result:

OFFICIAL STANDING ACCORDING TO REVISED REPORT OF QUAKER CITY MOTOR CLUB'S CONTEST COMMITTEE

CLASS A—TOURING CARS

FOREIGN SUBSCRIPTION AGENTS:
ENGLAND:—W. H. Smith & Sons, Ltd., 186 Strand, London, W. C., and all their railroad bookstalls and agencies throughout Great Britain; also in Paris at 248 Rue de Rivoli.
FRANCE:—L. Baudry de Saunier, offices of "Omnia," 20 Rue Duret, Avenue de la Grande Armee, Paris.
GERMANY:—A. Seydel, Mohrenstrasse 9, Berlin.

Entered at New York, N. Y., as second-class matter.
The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

ANENT THE PASSING SHOW

To say that the Grand Central Palace show indicates progress is both trite and commonplace. But this progress is noted in the mechanical features and in the body work which the individual prospective purchaser can see, appreciate, and willingly pay for.

A large amount of substantial growth is apparent in the commercial vehicle section, which seems to grow every year. A year or two more and an entirely separate show for the power wagons will be a necessity.

A fine lot of taxicabs of vastly improved appearance and superior mechanically are to be seen, many of the newcomers being in this group.

The high-wheel section, to the partisan of that type, is numerous and. beyond mere numbers, are worthy of very close attention.

The constant ramification of the industry is shown by the exhibition of a well worked out children's car along simple lines, small and compact, but complete in every minor detail.

But the delightful part of the show to any real optimist is the touring section. This individual with the roseate views of life wants no sombre matter of fact commercial vehicle, no homely but useful motor buggy, nothing but the high-powered high-grade distance traveler. And it is present in force, too.

To the cheerful optimist, the show really is an expression of optimism: Talk of big outputs, factory enlargements, doubling the working force, etc. On every hand you meet it. Every one is cheerful, confident, smiling, sure of a pleasant and profitable future. Manufacturers are unwilling to talk of conservatism, or to croak or discredit the present outlook for the biggest year the industry has ever known. Agents who had sold their allotment came begging, imploring, demanding more cars. They are sure they can sell them; regardless of the section of the country, the car or the price, they can sell anything. Of this they are confident.

Back of all this can be but one thing, the biggest and the most cheerful optimist of them all, the great American public, which has shown that it wants American cars and wants them badly. Not only do they want them now, but they are going to continue to do so, to-morrow and the next day, and a year from now. It is the manufacturer who sees and appreciates this that is building the big three-story additions. The numerous garage buildings all over the country is but a straw in the wind which promises soon to be a gale. The vast extension of the accessory business is another indication of it. On every hand, signs are not lacking to show that any optimistic view of the automobile situation, no matter how roseate, is not without a solid foundation.

* * *

PLANS OF CARRIAGE BUILDERS INDICATED

Doubtless the average automobile builder looks upon the buggy type as the carriage builders' concession in recognition of the growth of the automobile industry and the fear that the tide is waxing strong, so strong in fact, as to sound the death knell of the horse as an animal of traction; hence the carriage that the horse made possible. A canvass of the situation as it is reflected at the show would seem to indicate that the carriage man has gone a little farther, in that he has evoluted the buggy type quite a little. In other words, the crude power buggy of a year ago is rapidly reducing itself to a machine, with higher wheels than the wheels as they obtain on automobiles, and the question arises if it is not really a reduction to practice of the "solid tire" in the buggy type as against the pneumatic tire in automobiles. True, the buggy types have held to what the automobile builder calls crude methods, many of which were cast aside several years ago by the builders of automobiles. On the other hand, it is easy enough to prove that the very automobile designers who see no good in the buggy have been increasing the diameters of their wheels year after year as the cost of pneumatics fell away. And who will deny that they will not continue the process for some time to come, as the cost of the tires is reduced? On the whole, then, is it not a fair indication of the drift to take into account the desires rather than the products? That a half loaf is better than no bread is assured, and that the pneumatics were held to a low diameter for several years was because none could afford to pay for more. In the meantime, solid tires made slow but sure progress, and the carriage makers were compelled to use them—or build automobiles. They struck the trail with solids, and used the carriage type of car in the process. The end is, as might have been predicted, the buggy type of mechanical car, which has simmered down to a proposition in which the advantages of resilient high wheels coupled with solid tires produced a situation of more than passing interest; and the end is not yet in sight.

AUTO ANGLES OF THE RECENT TARIFF HEARINGS

WASHINGTON, D. C., Jan. 3.—The recent tariff hearings before the Ways and Means Committee have developed the interesting news that the Fiat Automobile Co., of Turin, Italy, is contemplating the establishment of a factory in this country. This fact was conveyed to the committee by Henry B. Joy, of the Packard Motor Car Co., in the following to Chairman Payne:

"I take the liberty of advising you that in the brief of the motor car manufacturers, which we are struggling to get ready, we suggest that the Fiat Automobile Co. in New York is connected so closely with the Fiat Automobile Co. of Turin, Italy, that the sales prices of cars between the factory and the New York store for the purposes of custom-house valuation may not be exactly on the level. In support of this I have seen the original letter of the Fiat Automobile Co. of New York to the Mayor of Detroit, a copy of which I enclose to you, in which the Fiat Automobile Co., being the New York company, speaks constantly throughout the letter of its relationship to the parent factory in Turin, Italy, which may be of interest to your committee. It is also worthy of note that the tariff laws as they now exist have produced an intent in the minds of the Turin company to remove its major part to America."

The letter to the Mayor of Detroit, referred to by Mr. Joy, is dated New York, December 15, 1908, and is signed by The Fiat Automobile Co., E. R. Hollander, vice-president. It follows:

"Owing to the strong probability that there will be no relief for imported cars in any customs revision that may be made under the new administration, we have decided to establish a large factory in this country for the manufacture of our cars and to remove to it a large portion of our manufacturing machinery, as well as our organization from Turin. We are therefore looking about for a suitable place to locate this new factory, which will be of very large proportions, and are writing you with the hope that you will do us the courtesy of bringing this question before the proper persons or organization in your city, with the idea that we may ascertain what inducements would be made, if any, for the establishment of such a plant in Detroit. We would guarantee to employ 500 skilled mechanics to begin and within a year employ 2,000. One of the officers of this company expects to sail for Europe about the middle of January, and any proposition that we might receive from your city will be submitted to our directors in Italy, upon his arrival, when the matter will be definitely settled.

In connection with the duty on antifriction ball bearings, the Packard Motor Car Co. sends the following communication to the Ways and Means Committee:

"Relative to duty on ball bearings, I would like to register with the Ways and Means Committee the attitude of this company toward the duty on ball bearings. This company favors the retention of the existing duty, namely, 45 per cent., on ball bearings. We are now large importers of ball bearings, importing over $100,000 worth from Germany and other European countries each year, on which we pay 45 per cent. duty. We do this because there are no ball bearings made in America of the same quality and durability as those which we import. We feel that with the existing tariff the American ball-bearing manufacturers may learn to make better bearings, as good as those in Germany, in the course of time. In this event the American competition would naturally reduce the price. American ball-bearing manufacturers have not yet gotten to a competitive basis. They have all been so busy supplying a new trade that it was more of a question to get the stuff out than it was as to price or quality, but the whole situation is rapidly shaking itself down to a competitive basis."

The various automobile manufacturers, including the Diamond Chain & Mfg. Co., Indianapolis; Whitney Mfg. Co., Hartford; Baldwin Chain & Mfg. Co., Springfield; Lefever Arms Co., Syracuse, and Link Belt Co., Indianapolis, have joined in asking the Ways and Means Committee that no reduction be made in the present tariff of 45 per cent. ad. valorem on their product. They presented reasons why the present duty should be retained.

NEW YORK'S GOVERNOR ASKS FOR MOTOR LAW REVISION

ALBANY, N. Y., Jan. 6.—Governor Hughes in his message to the Legislature, read in both Senate and Assembly at noon to-day, has a recommendation which will interest all automobile owners. The Governor recommends a heavier tax on motor vehicles, the proceeds to be used for the repair of highways, and also drastic legislation and penalties for the protection of those whose lives he now seems to believe are imperiled by the reckless driving of automobiles. The Governor combines his good roads and motor vehicle recommendations under the same sub-head of "Highways and Motor Vehicles," and says:

There have been 809 miles of State roads completed during the past year. The new Highway law is now in effect and provides for an improved system of administration designed to perfect methods and secure proper continuity of organization and policy. It is of little purpose to build new roads unless the roads which are constructed are also properly maintained. And in no department of the State's work are there more serious problems and greater need of the utmost efficiency. It is believed that these necessities are fully appreciated by the people and that in response to their demand we shall be able to secure a system of improved highways worthy of the State.

The difficult of maintaining our highways has been so largely increased by the use of motor vehicles that I recommend for your consideration the advisability of imposing a substantial license tax for the privilege of operating motor vehicles within the State, the proceeds to be devoted to highway repair. It is desirable that such license fees should be uniform in our State and in the States with which we are in contact, and in advance of legislation opportunity should be offered for prompt interchange of opinion and for securing an agreed basis of action. This, it would seem, might be accomplished through the Commissioners on Uniform Laws.

The reckless disregard of human life that is so frequently manifested in the driving of automobiles calls for drastic measures of protection, both with regard to means of identifying vehicles and in providing an increased punishment where those guilty of criminal conduct seek to escape arrest. And I invite your attention to this matter.

HOUPT IN THE ROLE OF MAKER.

Several unofficial reports dealing with the relations between the Harry S. Houpt Company and the E. R. Thomas Motor Company have indicated a severance of these relations in the near future. Mr. Houpt will handle the new Herreshoff car as a private venture and not as the Harry S. Houpt Company, because of the contract which the latter company has with the Thomas people. This is in force at present, and will continue until next August, Houpt energy to be devoted to the same line as before.

Upon the expiration of this contract, however, a switch will be made to a new line of cars, including the Herreshoff in the "fifteen-hundred class," and a new big car to bear the Houpt name. The details of this new one and of its manufacture have not been made public.

A. B. TUCKER DIES VERY SUDDENLY.

A. B. Tucker, well known in automobile circles, succumbed to heart disease early Monday morning of this week at his home in New York City. Mr. Tucker had many friends in automobiling, and had been a prominent figure in the promoting line for several years, though his first important position was that of secretary of the National Association of Automobile Manufacturers. Subsequently he served as secretary of the special A. A. A. touring committee having in charge the annual tour for the Glidden trophy. Later Mr. Tucker became secretary of the New York Motor Club, and later was identified with the New York Automobile Club. During the past two years he has looked after publicity matters for several concerns, at which work he was exceptionally successful.

CLUBS PREPARE FOR WORK OF NEW YEAR

DENVER AUTOISTS TO HAVE LIVE SEASON.

DENVER, COLO., Jan. 2.—There promises to be considerable activity in automobiling circles in Denver during the coming year, according to the strenuous program being mapped out by the Denver Motor Club. It is proposed by the club that every man, woman, and child in Denver, the people of Colorado, and the whole country in general, shall know that the club is living up to its motto of "Do Something." The membership is now climbing rapidly toward the 400 mark, and it is expected to have double that number enrolled when the A. A. A. tourists arrive in Denver next July.

The most conspicuous event now on the Club's calendar is the automobile show, which will be held February 16 to 18 at the Auditorium. This show promises to surpass any exhibition of the kind ever held west of Chicago. The local dealers have entered enthusiastically into the project, and are urging the Eastern manufacturers to come to the front and send exhibits here. The show committee is in receipt of assurances from Eastern manufacturers who have no representatives here in which they say they will send exhibits to the Denver show.

Some time in April it is planned to have an illuminated parade. The principal streets will be decorated and the cars will be illuminated with electric lights in the club colors. Handsome prizes will be given to stimulate interest in the event.

In May there will be a gymkhana. There will be obstacle races, slow races, balancing the cars on a teeter board, spearing Greeley potatoes suspended on a string, and other interesting events.

Orphans' Day will be observed early in June. On this day every member of the club is expected to furnish his car and aid in giving the fatherless and motherless boys and girls of Denver a good long automobile ride. The various institutions of the city will be called upon to furnish the children and there will be plenty of cars to accommodate them all.

In July the A. A. A. Tour will hold the boards. When the army of Eastern motorists swoop down on Denver after their long journey across the continent, the Denver Motor Club will be prepared to give them a genuine, old-fashioned Western welcome. The city will be decorated in their honor and for a week at least there will be a continuous round of motoring entertainment such as the Glidden tourists of former years have never before witnessed. There will be a road race, a hill climb, and other attractions, so that the tourists will not have an idle time on their hands during their stay in Colorado.

Sandwiched in between these events, the club is arranging for week-end runs to various towns and mountain resorts where splendid dinners and various mild sorts of entertainment will be given. The club is now fairly settled in its new quarters, 1407 Cleveland place, where the members and their guests find all the comforts of home.

OHIO AUTO LAW DEVELOPS AN IMPERFECTION.

COLUMBUS, O., Jan. 5.—A queer freak has developed in the State Motor Vehicle Law, for there is no provision to compel the changing of colors on the tags each year. Consequently this feature of the law received considerable attention at the meeting of the directors of the State Automobile Association in the rooms of the Columbus Automobile Club last week. An attempt will be made to secure the passage of such an amendment, and also one which shall provide that all licenses must expire at a certain time of year, say January 1, in order that the task of renewing them may be made much lighter. A number of other amendments were suggested, but because of the opposition by some of the members of the Legislature to anything pertaining to automobiles it was thought better not to go too far, for fear the entire bill might be declared unconstitutional. In the meantime all the interested ones are working for the amendment:

SPEARE AGAIN BAY STATE PRESIDENT.

BOSTON, Jan. 4.—The annual meeting of the Bay State Automobile Association was held to-day in the clubrooms in the Hotel Carlton, and Lewis R. Speare, former president of the association, was again chosen president, succeeding Elliott C. Lee in that office. Harlan W. Whipple was reelected vice-president. J. S. Hathaway, manager of the White Company branch in this city, is the new treasurer. Secretary James Fortescue was reelected secretary.

The new directors are George W. McNear, Dr. Julius F. Hovestadt, F. A. Hinchcliffe, manager of the Winton branch; K. M. Blake, manager of the Locomobile branch, and C. F. Whitney, manager of the Park Square Auto Station and agent for the Alco and the Stoddard-Dayton. The efforts of the retiring officers to free the association from debt were successful, and the report of the treasurer showed that the association no longer was encumbered by a debt, and that it was in excellent condition financially.

BRONXVILLE CLUB HOLDS ANNUAL MEETING.

BRONXVILLE, N. Y., Jan. 5.—At the second annual meeting of the Bronxville Automobile Club, held at the Hotel Gramatan, the following board of governors was chosen for the ensuing year: H. Ward Leonard, Arthur W. Lawrence, H. R. Burt, Frederick Ackerman, Frederick H. Elliott, W. K. Fertig, Eugene Southhack. In executive session the board elected the following officers: President, H. Ward Leonard; vice-president, Frederick Ackerman; secretary-treasurer, H. R. Burt.

The club has been very active in the erection of road signs, and has held several successful runs during the past year. It has been suggested that a new modern garage should be erected to care for the large number of cars now owned in Bronxville, and it is quite probable that the local club officers will assist in the selection of a site which would be convenient to all, especially the visiting autoists, many of whom are patrons of the Hotel Gramatan.

LOUISIANA MOTOR LEAGUE JOINS A. A. A.

NEW ORLEANS, Jan. 4.—The State Automobile Association, the Louisiana Motor League, has made application for admittance to the American Automobile Association, and has announced that it will hold weekly meetings hereafter. The league is interested in the establishment of good roads in the South, and is planning a steady campaign in that direction. It will work in unison with the New Orleans Automobile Club.

Extensive preparations are being made for the races during Mardi Gras week, February 20-22, at the fair grounds track. These races are under the auspices of the New Orleans Automobile Club, and will be one of the chief attractions for Mardi Gras visitors. Fred J. Wagner, of New York, has been engaged to act as referee and starter and general manager for the New Orleans races. He has already assumed charge of the preliminaries.

WILLIMANTIC CLUB VOTED FOR LINCOLN.

WILLIMANTIC, CONN., Jan. 4.—At the annual meeting of the Willimantic Automobile Club the following officers were elected: President, Louis B. Lincoln; vice-president, Walter B. Knight; secretary, Frank H. Elmore; treasurer, Edward F. Whitmore; board of governors, the officers and Ernest P. Chesbro, Arthur B. Small, Frank L. Powell; directors, Connecticut State Automobile Association, Edward F. Whitmore and Harry J. Cotter; member Good Roads Committee, E. P. Chesbro. The treasurer reported money in the treasury and the expenditure of other funds for good road work. The club then adjourned until after the holidays, when the work for the new year will be mapped out.

Reos Being Towed from D. L. & W. R. R. Ferry to R. M. Owen & Co., 1759 Broadway, New York.

Maxim Invents Novel Tire Pump.—The demand for mechanical tire pumps has produced many of these, but one of the latest to come out bids fair to be the simplest, and, therefore, the best of all this line of labor saving devices. In this new device the exhaust from the motor is used instead of atmospheric air. H. P. Maxim has introduced this new and novel tire pump, which is readily attached to any gas engine and which is actuated by the exhaust. The inflator is carried along the sides or tops of the cylinders and will fit any car with slight alterations. It consists of a copper tube and series of coils permanently attached to the relief cock, by which the exhaust gas is cooled and forced into the tires. It is claimed that the exhaust gas is a better inflating agent than air, for the reason that it is non-oxidizing. In place of the conventional relief cock, there is inserted the connection of the pump, which is nothing more or less than a long copper tube containing several coils with a cock at each end. One of these cocks is inserted in the place of the relief cock and contains a small steel ball. The long copper tube is carried out to the dash convenient to the driver's seat. When it is desired to utilize the pump, the exhaust gas is permitted to pass through the copper tube and the coils tend to cool it as well as care for foreign matter. A pressure gauge is attached to the dash. It requires about two minutes and a half to inflate a tire with the device.

Duluth Wants a Motor Patrol.—Bids will be opened December 30 for an automobile patrol wagon which must be delivered within two months. Power is required to climb any of the city's big hills, but the speeds specified are low, 20 m.h.p. maximum, 4 m.h.p. minimum. A seating capacity of ten is called for, as well as stretchers. The successful bidder must operate for thirty days at his own expense and guarantee the machine for a year. In addition, the cost must not exceed $2,500.

Autos Popular with Kansas Farmers.—To demonstrate the extent of the adoption of the automobile in the rural districts, some enthusiast has collected figures which show that over 600 farmers in Central Kansas alone own cars, with orders of Spring delivery of 100 more.

Advance Show.—An interesting little exhibit is the advance showing of the Winton Motor Carriage Company at its Broadway salesrooms, New York City. This includes all of its Garden Show cars, and the Winton phaeton sold to Robert Allison, of Port Carbon, Pa., in 1898, said to be the first bona-fide sale of an American made gasoline car. The "six," which won the first prize in the upkeep contest, is also on display.

Nitro-glycerine Automobile.—Probably nothing during the past year has indicated more clearly the advance automobile construction, carrying with it the total absence of vibration, than the announcement of the recent use of an ordinary car to carry 40 quarts of nitroglycerine a distance of 100 miles over roads not particularly good. This was done by W. D. Tracy, an oil well shooter of Bolivar, N. Y., and the trip was from that town to Bristol, where Mr. Tracy shot a gas well for the Ontario Gas Company.

Automobile Service for Municipality.—An American consul in Western Europe reports that a company has been organized for the purpose of establishing automobile service for the city in which he is located. It is proposed to increase the stock of the company as business grows. The consul has forwarded the company such catalogues of American cars as he had on file, and suggests that manufacturers write direct to the director of the company, whose address is given in the report. In writing for this report, refer to No. 2,903.

Firestone Jollification.—To celebrate the completion of a four-story building, the officials and employees of the Firestone Tire & Rubber Company joined in a jollification supper and dance Tuesday evening, December 29. Nearly a thousand guests were present, filling the whole fourth floor, and all voted it the best time ever. This new building will be exclusively for the manufacturing equipment of the new non-skid tire.

Auto Stages for Florida Resorts.—A regular line of automobile service between Ormond, Daytona and Palm Beach is about to be inaugurated by the Florida East Coast Hotel Company, for the benefit of the guests at the hotels of those resorts. The service will be furnished by three forty-horsepower "A. L. Co." cars, which were shopped a few days ago by the American Locomotive Company.

Big Demand for Anti-Skid Tires.—Due to the great run on the staggard tread tires, the Republic Rubber Company, of New York, has been obliged to move to larger quarters. Their new home will be at 229 West Fifty-eighth street, where a four-story building will triple their floor space afforded by the present building across the street.

Benefit Association for Firestone Company.—The factory and office employees of the Firestone Tire & Rubber Company have organized the Firestone Mutual Benefit Association, for the purpose of providing a benefit fund. The aim will be to furnish both sick and death benefits for all members by a series of social gatherings to strengthen the relations between them.

More Fire Wagons.—The White Garage Company has been awarded the contract to furnish the fire department of Baltimore with two White steamers. The company's bid was $4,194. The cars will be used in responding to alarms by Chief Horton and Deputy Chief Emrich.

Speedwell Building Again.—The Speedwell Motor Car Company, of Dayton, O., will soon begin work on another new building. This will be used for chassis painting only. They are also erecting a 12,000-gallon water tower, being outside of the city fire limits.

Truck Company Moving.—The Reliance Motor Truck Company is now busy moving from Detroit to their new and extensive plant in Owosso, Mich., where the full line of Reliance trucks with two-cycle motors will hereafter be built.

IN AND ABOUT THE AGENCIES.

The Pierce Arrow Again Stands the Strain.—The builders of the Pierce Arrow have just been notified of an incident which happened to a California owner of a Pierce, the results of which make them feel that they have again been justified in their policy of refusing to sacrifice strength for light weight. A. A. Busey, of Oakland, Cal., with a party of eight in his six-cylinder Pierce, was compelled to drive his car over an eight-foot embankment to avoid collision with a railroad train. According to the story, the car turned over three times before coming to a stop, with the result that the occupants received a severe shaking up with a few bruises. The top, glass front, and radiator were smashed, but on righting the car no serious damage was found and it left the scene under its own power.

Ramblers Long-Lived.—The statement was recently made that the average life of an automobile was about five years. Figures given out by Thomas B. Jeffery & Company, relative to Rambler cars, would seem to indicate that this was a very conservative estimate. The statement is made that 13,800 Ramblers have been built and are now running, of which 400 are seven years old, 1,500 are six years old, 2,100 admit to five years, 2,300 are no less than four years, while the remaining 5,000 have been built in the past two years. Another similar significant fact is that the repair parts in the past year amounted to but $213,438.86, an average of $15.25 per car.

Goodyear, Boston.—Owing to the increase of business, the Goodyear Tire & Rubber Company has acquired new quarters at 669 Boylston street, and is tearing down the old building now standing on that lot and erecting a new five-story building, with all modern improvements and fully equipped for business. The new building will contain over 10,000 square feet of floor space. An up-to-date repair shop is included, with all the latest improvements. The branch expects to be in the new quarters about May 1.

Speedwell.—These cars will we handled in Pittsburg during the coming year by the Speedwell Automobile Company, with salesrooms and garage at 5986 Center avenue; in Philadelphia by the Standard Motor Car Company, 616 North Broad street, and in Chicago by the Speedwell Motor Car Company, with of-

fices and salesrooms at 1355 Michigan avenue. The Speedwell Motor Car Company, Dayton, O., are the makers.

Stevens-Duryea, New York City and Philadelphia.—The A. G. Spalding & Bros. announce the enlargement of their New York and Philadelphia salesrooms, the latter including a new building at 202-204 North Broad street, which is considered one of the handsomest in the row. The Stevens-Duryea line for the coming year will be a continuance of the successful "fours" and "sixes" of the past season.

Franklin.—The H. H. Franklin Mfg. Company has appointed the following additional agents for 1909: Springfield, O., William Gaitter; Cherokee, Ia., William R. Johnson; Coffeyville, Kan., Brown Brokerage Company at Coffman's Auto Garage; Pierre, S. D., Gas Belt Land and Abstract Company; Aberdeen, S. D., F. W. Boettcher; Columbus, Ga., C. E. Shultz.

Winton, Baltimore.—The Winton Motor Carriage Company has secured more extensive location on Liberty street, near Lexington. This is in the business district. The new store will be ready for occupancy January 15. The local branch house has been at North avenue and St. Paul street since it was established a little more than a year ago.

Changed Their Name.—The Marion-Overland Auto Company, of 1875 Broadway, New York City, sales agent for both the Marion and Overland cars, has obtained the consent of the Supreme Court to change its name to the Overland Company, of New York. This will be adopted January 7 without any change in the personnel of the company.

Velie, Chicago.—The new Chicago branch of the Velie Motor Vehicle Company, of Moline, Ill., will occupy the building at 1615-1617 Michigan avenue, now tenanted by the Packard agency, which will move in the Spring. H. G. Moore, former secretary of the McDuffie Automobile Company, will have charge.

Pope-Waverley, Oakland, Cal.—The Western Electric Vehicle Company has now located in their new building at Thirty-fourth and Telegraph avenue. Besides maintaining an ambulance service, they will conduct a garage and handle the Pope-Waverley, Baker and Detroit electrics.

Packard, Providence.—The Flint Motor Car Company, agents for the Packard, has been obliged to double their floor space. The large store adjacent to the present agency has been leased and the partition walls are now being torn out.

Winton, Baltimore.—The Baltimore branch house of the Winton Motor Carriage Company has removed to Liberty street at Lexington avenue, where fine new quarters have been secured.

Elmore, Utica, N. Y.—I. R. Gardiner, with offices in the Commercial Travelers' Building, has been appointed agent for the Elmore car in Oneida and Herkimer counties.

Renault, Brooklyn, N. Y.—Alexandre Clement, the well-known racing driver, has taken over the Plaza Garage, 920-922 Union street. He is the agent for the Renault car.

Maxwell, Trenton, N. J.—Thoman Bros., agents in this city for the Maxwell car, has placed a sub-agency in Bordentown. Bernard H. Adams is to be in charge.

Franklin, Kalamazoo.—The E. J. Dayton Motor Company, who will handle the Oldsmobile and Franklin, has opened headquarters on Water street.

R. and L. Electric, Pittsburg.—C. P. Bowdion, of the Mutual Motor Car Company has taken the agency for the Rauch and Lang electric car.

Thomas, Wilkes-Barre, Pa.—The Coward & Long Company has taken a subagency for the Thomas in this vicinity.

Oldsmobile, Newark.—Sanford J. Wise will have charge of the new branch at 81 Washington street, Newark.

Reo, Trenton, N. J.—Dr. A. H. Boice has been appointed agent for the Reo car.

PERSONAL TRADE MENTION.

Wallace L'Hommedieu, formerly with the Autocar Company, Ardmore, Pa., and the Electric Vehicle Company, Hartford, Conn., has just joined the sales forces of the Apperson Brothers' Automobile Company, Kokomo, Ind.

John B. Guthrie will represent the Carpenter Steel Company after January 1 in the Pittsburg district, with offices in the Columbia Bank building, Fourth avenue and Wood street, Pittsburg.

F. A. Brezina, formerly with the Electric Vehicle Company as purchasing agent, is now connected with the Locomobile Company of America, Bridgeport, Conn.

Emory Carhart, salesman for the Denver branch of the Studebaker Company, tendered his resignation, which took effect January 1.

Elliott S. Church is now connected with the sales force of the George H. Dunham Company, Boston.

Robert W. Blake has joined the local force of salesmen for the Pullman car in Philadelphia.

RECENT INCORPORATIONS.

MotoBloc Import Company, New York City, with a capital of $5,000, will manufacture, deal in and rent automobiles. Incorporators: H. M. Brown, F. W. Mills, and E. J. Forham, 154 Nassau street.

Garwood Electric Company, Garwood, N. J., capital $250,000. Incorporators: E. A. Keegan, A. K. Westerdahl, G. N. Williams and G. W. Archinson.

F. & D. Mfg. Co., Portland, Me., capital $400,000, will do a general automobile business. C. E. Eaton is president and T. L. Croken, clerk.

Fritz Bros. Automobile Company, Oklahoma City, capital $40,000. Incorporators: C. D. Fritz, E. J. Fritz and R. W. Yantis.

F. S. Hoaglin Automobile Company, Oshkosh, Wis., capital $10,000. Incorporators: F. S. Hoaglin, A. E. Badger and L. O. Chase.

Read Garage and Machine Company, Belfast, Me., capital $10,000, will work a garage and machine shop.

Star Garage Company, Londonville, N. Y., capital $25,000, to do a general garage business.

Hitchcock Banks Motor Car Company, of Providence, R. I., with capital stock of $25,000.

Norris Motor Company, Cambridge, Mass., capital $50,000. President, W. S. Young.

Pioneer Motor Car Company, of Muskogee, Mich., with capital stock of $10,000.

Farmobile Manufacturing Company, of Columbus, O., with capital of $200,000.

Markle-Light Motor Car Company, of Pottstown, with capital of $150,000.

Jewel Motor Car Company, of New York, with capital stock of $10,000.

Automobile Coaching Company, of Boston, with capital of $20,000.

M. F. D. Motor Parts Company, Dover, Del., capital $25,000.

Pierson Garage Company, Janesville, Wis., capital $1,000.

RECENT PUBLICATIONS.

The Girl and the Motor, by Hilda Ward; 120 pp., cloth, illustrated; the Gas Engine Publishing Company, Cincinnati, O.; price, $1. It is not often that a girl writes a book on gas engine troubles, and a good, readable book at that, but that is the fact of this case. There is no plot, but quite a little romance, some good descriptions of beautiful Long Island scenery, and a touch of the eternally feminine to take the subject, the real subject of the book, completely out of one's mind. The story deals with the unusual, or, perhaps, a better word would be unique experiences of a young lady who, without previous experience in that line, buys first a small motor boat, later a small 6-horsepower machine, and finally a 20-horsepower automobile. Some of her experiences call for feminine remedies, which are described in language that is truly feminine, as, for instance, "gaskets with buttonholes for the bolts to go through"; a commutator, "the under side of which consisted of a piece of brass set in a fiber bracelet around its shaft," etc. It is a pleasant, readable little book, gotten up in the style of a gift edition, on heavy book paper, with wide margins, pretty type face, and a good binding. The novice and some "experts" will learn much from the troubles experienced by the author and their solutions.

Standard Roller Bearing Company, Philadelphia.—Engineers and others interested in ball or roller bearings should send for No. 24 catalogue of the Standard Roller Bearing Company. This 200-page booklet in pocket size not only contains pictures taken in the various shops showing the manufacturing processes, but many diagrammatical applications, efficiency, power and friction curves, together with a full description and prices of all S. R. B. products. These include ball and roller bearings, complete front and rear axles, gray iron, brass and crucible steel castings, drop forgings and machine work on particular duplicate parts, which can be handled in automatic machinery.

National Brake & Electric Company, Milwaukee, Wis.—Under the title, "Air Compressors for Industrial Service," this concern has issued a little pamphlet that will greatly interest garagemen and others having necessity for compressed air. Besides a regular line varying from a single-cylinder, 2 1-2 by 4 1-2 machine up to three-cylinder, 11 1-8 by 15 1-2, the company is now turning out a portable outfit in several styles. This consists of a small compressor and motive power mounted on a hand truck, the whole being made narrow enough to go through ordinary doors. Dimensions, capacity and other dsta are given in tabular form.

Premier Motor Mfg. Co., Indianapolis.—The frontispiece of the early catalogue of the Premier Motor Mfg. Co. shows an interesting photo of the 100-miles-for-100-days car passing the 5,000-mile mark on the second day of the Glidden Tour. This leaflet is a brief description of the mechanical details of this Indianapolis product. The changes indicated are very few and far between, being refinements rather than changes. The low-tension make and break ignition is now regular on both the four and six-cylinder models. This compsny may be fairly numbered among the American advocates of this type of ignition.

Hart-Kraft Motor Wagons, York, Pa.—Catalogue B, describing the commercial power wagons recently placed on the market. These include four types of body on the same chassis, all of 1,000 pounds capacity. The feature is an interchangeable self-contained unit power plant which may be removed at very short notice by the simple removal of five bolts. This allows the withdrawal of the complete power plant and the immediste substitution of another with a minimum amount of lost time.

A. S. Noonan Tool & Machine Works, Rome, N. Y.—Catslogue showing automobile, motorcycle and bicycle tools manufactured by this firm. These include valve spring lifters, tire holders, muffler cutouts, spark plug terminals, etc.

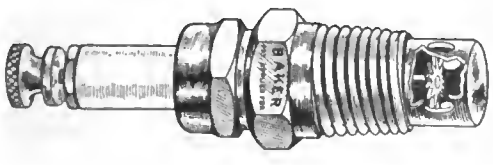
Construction of a Gasoline Motor Vehicle

By C. C. BRAMWELL. Contains 150 pages, 6 x 9; one hundred illustrations and diagrams. Publisher's price, $2.00; our price, 50 cents. Address, The Automobile, 231-241 West 39th Street, New York.



"BAKER" SPARK PLUG A permanent fixture to your engine. You do not have to take it out and clean it—it cannot foul or short circuit under the severest conditions. Enclosed ignition chamber and the multiple sparking points insure positive ignition, and the highest degree of efficiency is obtained regardless of conditions imposed. Sparks in oil, and never fails to ignite under the least electromotive force. You never saw anything half so good as this. Order one to-day and try it.

The Baker Mfg. Co., (Inc.) **Cor. East & Chapel Sts. NEW HAVEN, CT.**
See our Exhibit, Space No. 433, 3d Tier, Garden Show

"ALL STEEL"

The B & S "All Steel" Screw Driver—new and improved—complete in one piece—drop forged of steel throughout with carefully tempered point. Specially designed handle for insuring positive and easy grip.

Nothing to get out of order—SIMPLE, LIGHT, EFFECTIVE and DURABLE. Made in eleven sizes—including two of heavier model, with square shank for the application of a wrench. Write for prices. **THE BILLINGS & SPENCER CO.**, Mfrs., Hartford Conn.

LAMBERT FRICTION DRIVE CARS

The Economical Lambert

THE LAMBERT is a simple car—correct in principle and design, sturdy in construction. It is as reliable, as **sure-going** as a car can be made.

There is just one thing that makes possible the manufacture of so good a car as the Lambert Car at a cost permitting us to sell it at the **low price** we do.

This one thing is the **Lambert Friction Drive** transmission. The cost of producing this **most** efficient (**proven**) transmission is so much lower than the cost of **any** type of the complicated gear transmission that we can—and do—put more real automobile worth into every Lambert Car than the manufacturer of **any** gear-transmission car can give for the same money.

The Lambert Car—each of our six models—has a full dollar's worth of power, speed, endurance, style and finished for every dollar of the price—and more too—if judged by ordinary standards. Each Lambert model—from the $800 Runabout Model A-I up to the big roomy 7-passenger Lambert at $2000—is a positive leader in its class—the choice of people who "find out" **before** they buy.

Our 1909 Proposition to Agents

We offer an exceptional proposition to agents and dealers in territory not now occupied by Lambert representatives. The demand for **good** automobiles at a low price cannot be denied.

We want the right kind of men to represent the **best** low-priced car—the Lambert Car.

In writing for full details please state what cars you are now handling and what your facilities are for taking care of our interests.

THE PERFECT ELECTRIC COUPE

Perfect in every department—as cozy and luxurious as any woman would have it—as able and efficient as any man would demand it to be.

Nothing is skimped in this car.

It is by far the handsomest coupe on the market to-day.

Write for our catalog describing mechanical features that will at once convince you that it's the soundest and strongest car of its kind in America.

See our exhibits at the New York and Chicago Shows. See if you know of a car half so good.

Model "G" Special

Glide

$2500

You Know Automobiles

READ THESE GLIDE SPECIFICATIONS

THE Glide is the first car perfect in size, in mechanism and in action that has ever been offered to the public at a correct price.

Many years of automobile building are back of every Glide—years of fruitful experience that have added to the merits and popularity of GLIDE cars.

The power plant is a 4-cylinder (cast separately) 45 actual H.P. motor. The crank shaft has 5 bearings—as it should have.

A constant level oiling system, eliminating piping and automatically maintaining the proper level of oil in the crank case at all times.

An improved form of selective type of transmission, located just forward of the rear axle, reducing the angularity of the propeller shaft.

A rear axle with liberally proportioned parts, and of a construction that gives an absolute assurance of perfect work.

A multiple disc clutch with discs of large diameter.

Double set of brakes—internal expanding and external contracting. Brake drums are 16 inches diameter, 3-inch face—will hold the car on a mountain grade. Absolute confidence in ability to slow down or halt at will is established when Glide brake equipment is examined. No brake system on any American or Foreign car has ever before been so comprehensively treated.

One Universal Joint only in GLIDE cars, located between the motor and the transmission. Remember, there are not two joints or three joints, or even four, as in other constructions. Timken Roller Bearing throughout—all gears of the best Alloy steel.

34 x 4½-inch tires all around—Wheel base 120 inches. Remember, tires are all alike, not 34 x 4-inches in front and 34 x 4½ inches in the rear, thus obviating the ridiculous necessity of carrying two sizes of spare casings and tubes.

The GLIDE is not an assembled car. It is built in our own shops, the motor excepted.

The GLIDE cars are sold before dealers buy them.

Buyers know that Glide cars at $2,000 and $2,500 are better cars than they can get for the same money anywhere else.

They know not only because of our extensive Glide advertising, but also because of Glide demonstrations and widely increasing sales.

Our advertising helps you sell Glide cars—and every sale brings another sale to you.

Our position is the one all manufacturers must take sooner or later—giving full value for the price.

We have open territory for live progressive dealers who want a permanent business built on the growing popularity of the Glide.

Write to-day for 1909 agency contracts and proof that the Glide agency is the best proposition you were ever offered.

Glide Roadster Model "R"—same chassis—Wheel base—36 x 4-inch tires all around, with either close coupled body seating 4, or Runabout body seating 2—$2,000.

Glide cars will be exhibited at the Chicago Show. Floor space H-I, immediately at the right of the main entrance—Wabash Ave.

The Bartholomew Co., Standard Manufacturers A. M. C. M. A. 235 Glide St., Peoria, Ill.

Get a Magneto You Can Depend on

The Wheeler & Schebler MAGNETO

Never Fails—Dependable Always

Side View

The greatest invention of the age for automobilists. Its use gives you positive assurance that all your ignition troubles are over.

You never know when you are going to have a breakdown with the old battery system; it's liable to happen any time—anywhere—in town or on tour—but when it does, that's when you appreciate the value of the dependable "Wheeler & Schebler" Magneto.

Why Take Chances When Certainty Is at Hand?

Equip your cars with "W & S" Magneto and you have absolutely the best, most perfect and economical system.

End View

The only wearing parts are a pair of imported annular Ball Bearings, we having done away with the commutator and brushes common on other makes. It has no wound rotators to burn out. It requires no governor, thus avoiding any trouble to which that part would be subject. It furnishes alternating current, making it impossible to burn out the coil. It does not pitt nor wear away the vibrator points. It is the only magneto which will give sparks each revolution at the shaft. It increases the power at the engine from ten to twenty per cent. over batteries.

Price $35

It excels any ignition system on the market to-day, and we can prove it. WRITE TO-DAY.

WHEELER & SCHEBLER

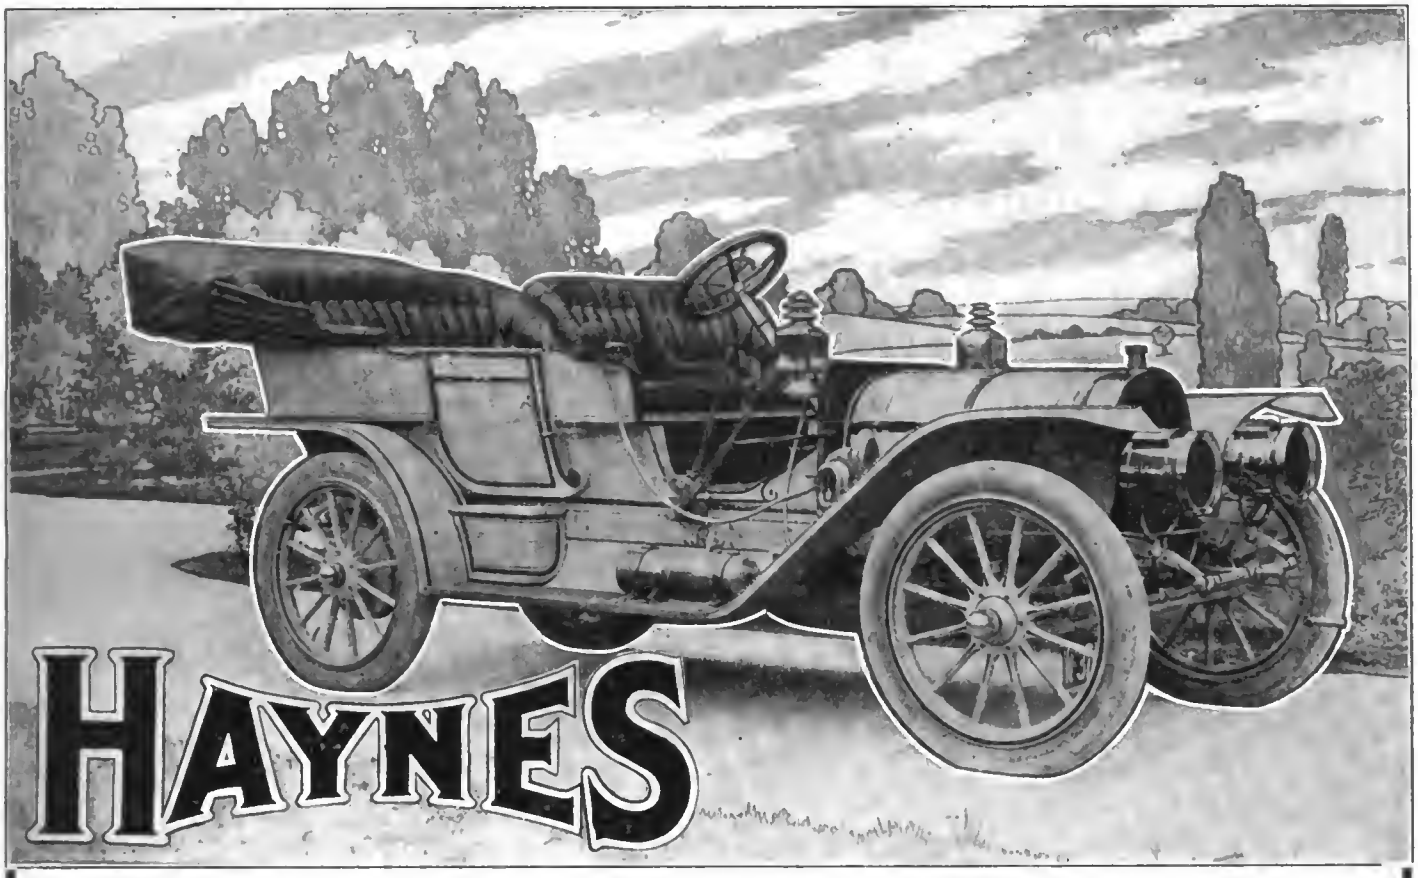
INDIANAPOLIS, IND.



The Haynes for 1909—40 H P., $3,000

The Car to Buy—And Why

Haynes Cars are built for strength. We use more different kinds of steel alloy than any other makers. We spend more money for the services of expert metallurgists. Everything about the Haynes is *big, solid, substantial.*

The results show in Reliability Runs. "The Haynes always makes a perfect score." Last year it won the only perfect score that was awarded in the big Chicago Motor Club Run. This year there were two Haynes entries. They both were among the five that won Perfect Scores.

We have been making cars since 1893. We sincerely believe that our experts (who have been with us from the beginning) know more about making automobiles that run than any other makers. The results prove it.

The loyalty of Haynes owners to us is a big asset to an agent. Some of our friends who started automobiling in the nineties, when we were lone pioneers in the industry, are now owners of a fifth or sixth generation of Haynes Cars. We have an established clientele all over the country.

We want to place a few more good, hustling agencies. Write for particulars.

Distributing Agency
GREAT WESTERN AUTOMOBILE CO.
1706-8 Main Street
KANSAS CITY, MO.

MODEL AUTOMOBILE COMPANY

97 Smith Street, PERU, INDIANA, U. S. A.

The past two years the showing of our 50-H. P., 7-passenger car has been so much better that in at least one of the larger cities we are leading all other manufacturers of this type of car in point of sales, and that, too, with little advertising. With the most powerful and durable motor for the weight ever produced in this country and by following the same construction throughout the car it is easy to show advantages over the heavy and cumbersome cars of same capacity and horsepower. The remarkable success of this car has induced us to duplicate it in two smaller sizes, and today we have the only line in which the lower price cars are of the same construction, except as to size. These smaller cars, No. 20 and No. 21, can be had with detachable tonneau, making an ideal car for doctors and contractors with comfortable space between front seat and dash. With such a line any good live dealer can go to the front and stay there if he is trying to build up a permanent business.

A visit to our factory where the adjacent country affords material for a thorough test of cars, will convince you that we have a line of better hill climbers and speedier cars than anything on the market today.

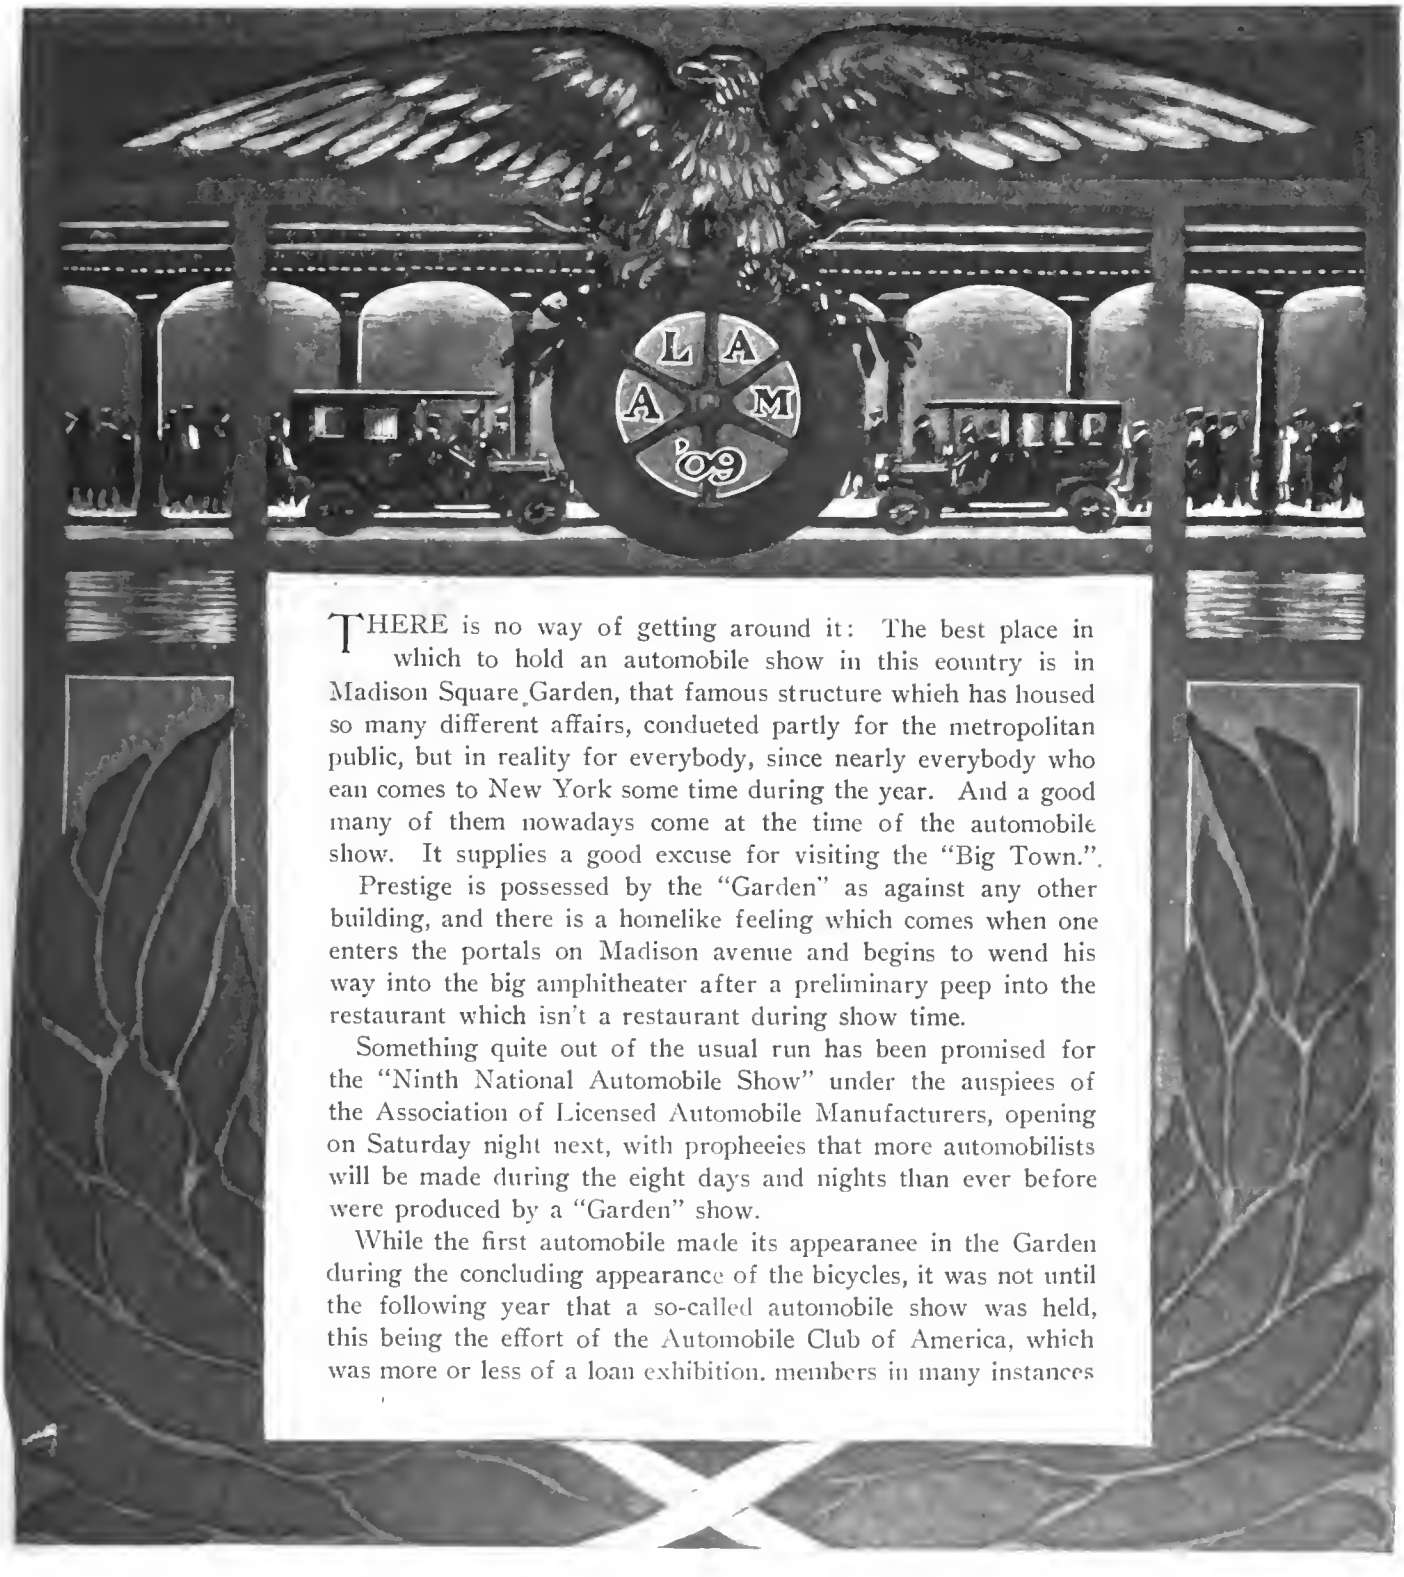
Members of Association Licensed Automobile Manufacturers.

VOL. XX NEW YORK—THURSDAY, JANUARY 14, 1909—CHICAGO No. 2

THE AUTOMOBILE



THERE is no way of getting around it: The best place in which to hold an automobile show in this country is in Madison Square Garden, that famous structure which has housed so many different affairs, conducted partly for the metropolitan public, but in reality for everybody, since nearly everybody who can comes to New York some time during the year. And a good many of them nowadays come at the time of the automobile show. It supplies a good excuse for visiting the "Big Town."

Prestige is possessed by the "Garden" as against any other building, and there is a homelike feeling which comes when one enters the portals on Madison avenue and begins to wend his way into the big amphitheater after a preliminary peep into the restaurant which isn't a restaurant during show time.

Something quite out of the usual run has been promised for the "Ninth National Automobile Show" under the auspices of the Association of Licensed Automobile Manufacturers, opening on Saturday night next, with prophecies that more automobilists will be made during the eight days and nights than ever before were produced by a "Garden" show.

While the first automobile made its appearance in the Garden during the concluding appearance of the bicycles, it was not until the following year that a so-called automobile show was held, this being the effort of the Automobile Club of America, which was more or less of a loan exhibition, members in many instances

loaning their cars, and the grand total of exhibitors, including accessory manufacturers, being sixty in number.

Incidentally, it should be mentioned that Secretary James C. Young had a good deal to do with the promoting of this show; in fact, if it had not been for his successful talk with Frank W. Sanger, who died several years ago, there would not have been any beginning in the Garden at all, at least not at that time. The show of December, 1901, also had a substantial loan account, with 93 actual exhibitors and none from abroad. Next came the display of January, 1903, with the National Association of Automobile Manufacturers promoting the show in conjunction with the A. C. A. and the Garden management. The list of exhibitors totaled 150, and the first foreign exhibitor was the Paris Automobile Company, represented by Henry Fournier. In 1904 under the same management there were over 200 exhibitors.

A year later it was plainly apparent that no one building could house the industry properly for exhibition purposes. Hence the 1906 show was that of the Association of Licensed Automobile Manufacturers, while the A. C. A. held an independent show at the same time in an armory not far away. Since then each year the A. L. A. M. show has continued to demonstrate progress and prosperity, and what is designated as the "Ninth Annual" bids fair to excel all of its predecessors.

'Tis promised that the decorative features will be artistically satisfying, with exhibits placed without undue crowding, and the comfort of those who attend well considered in the general conduct of the exhibition.

The Famous Firm of George B. Selden and Son.

This year the color scheme of the show is brown and white, with green carpet on the floor of the exhibition spaces. By the use of the decorative lamp-posts bearing the names of the exhibitors, and the manner in which the entrance way will be treated, it will be possible to get a comprehensive view of the whole main floor, the exhibits being represented panoramically. Mirrors at certain points deepen the perspective. The A. L. A. M. "Old Abe" emblem will be conspicuous—an eagle with outspread wings perched on an automobile wheel.

A triumphal arch, 87 by 48 feet, at the rear of the Garden, will be the *piece de resistance* of the decorative scheme. It is the most massive and ambitious piece of ornamentation ever undertaken for an indoor exhibition.

This year the show is one of American-built cars only—truly a national event.

In the date fixed for the ninth show there is a tacit recognition by the makers of the changed character and new commercial value of automobile shows. The previous show in the Garden was held during the first week in November, and the present exhibition marks the second time that the show date has been moved along from the Fall to January. It is now accepted that the show is for the public, the individual enthusiast, the buyer and user, although it is still conducted by the manufacturers and not by the retailers. "This is the essential difference," states the press agent, "between the two national shows in New York and Chicago, and those of Boston, Philadelphia, and elsewhere. In former years it was considered that the show was a trade event, one arranged by the manufacturers for the dealer. Then the dealers waited till show time before making their commitments as to the exact cars they would handle during the ensuing year. At the show the manufacturer expected to book his agents and close his contracts with them for the number of cars they would handle. The business done direct with users was deemed of secondary consequence. This condition was largely a theory always. It was more or less a fact during the first two or three shows, but the January date was too late for agents. They began to close their deals with the manufacturers early in the Fall, and by show time most of the big makers had no interest in making new agents, and the show was merely a public educator and stimulus, at which a fair amount of retail orders were booked. Still, the theory held that the manufacturers ran the shows for the benefit of agents, and its influence was noticed when, after two shows in the Fall and five in January, the eighth show was set back to the 1st of November. The result demonstrated that the show is now an exposition for the public."

In view of all that has happened since the first real exhibition in the Garden, it might be interesting to read again the list of those who participated. Here they are:

Electric Vehicle Co., Riker Vehicle Co., Locomobile Company of America, National Automobile & Electric Co., De Dion-Bouton Motorette Co., Waltham Mfg. Co., American Bicycle Co., Winton Motor Carriage Co., Mobile Company of America, Baker Motor Vehicle Co., Autocar Co., Foster Automobile Manufacturing Co., Automobile Company of America, Woods Motor Vehicle Co., Stanley Manufacturing Co., Canda Manufacturing Co., Buffalo Electric Carriage Co., Daimler Manufacturing Co., Holyoke Automobile Co., Knox Automobile Co., Overman Automobile Co., International Motor Carriage Co., Trinity Cycle Manufacturing Co., John T. Miller, New Process Rawhide Co., New York Belting & Packing Co., Pennsylvania Automobile & Gear Co., C. F. Splitdorf, Veeder Manufacturing Co., and Ware Brothers.

Charles Clifton - President A.L.A.M.

Col. George Pope - Chairman Show Committee

E. P. Chalfant - General Manager A.L.A.M.

The Show Committee of the A. L. A. M.

M. L. Downs - Secretary

Coker F. Clarkson - - - A. L. A. M. Publicity.

NATURALLY the first thing to do in order to conduct successfully an automobile exhibition is to get a show committee. Experience counts for much in affairs of this kind where innumerable details require prompt and skilful attention, or otherwise an avalanche of little things accumulates and sadly interferes with the perfect lubrication so essential in satisfying first the exhibitors and ultimately the public itself.

In the contingent which has direct charge of the "Ninth National Automobile Show" in Madison Square Garden are men well qualified for the work and who have demonstrated the fact on previous occasions. The A. L. A. M. only requires four members for its committee, including President Charles Clifton, ex-officio. There is one new face on the committee this year and a second new one prominent in connection with the show work. The new member of the committee is E. P. Chalfant, the new general manager of the Association of Licensed Automobile Manufacturers, and the new man associated with the committee work is Coker F. Clarkson, the new head of the A. L. A. M. publicity department. The others of the committee are the same as last year: Col. George Pope, chairman; Charles Clifton, and M. L. Downs, secretary.

To the ability of these men is due the success and magnificence of the "Garden" show. Charles Clifton is as prominent a figure as any in the industry, he being treasurer of the George N. Pierce Company and president of the Association of Licensed Automobile Manufacturers, with all the affiliations and activities those positions imply.

Col. George Pope is a landmark in the industry, having been for years the treasurer of the Pope Manufacturing Company. He has been chairman of the A. L. A. M. show committee for three successive years.

Edward P. Chalfant has been identified with the automobile industry since January 1, 1905, although he was previously in the tire business. He was sales manager and a director of the Waltham Manufacturing Company until he was called to the post of general manager of the A. L. A. M.

M. L. Downs, secretary of the committee, has been identified with the automobile industry since its inception and has been in every branch of it, even to managing some big runs. For the last five years he has been with the A. L. A. M. and has attended to the detail work in connection with all the licensed shows.

Coker F. Clarkson, the new head of the A. L. A. M. publicity department, is a lawyer who found a greater interest in engineering matters, and from electrical experimenting he stepped into the A. L. A. M. as secretary of its mechanical branch, which post he retains with his new one. Mr. Clarkson in his younger days did newspaper work. He is a former president of the Y. M. C. A. Motor Club, being a graduate of the first Y. M. C. A. motor class. He is the compiler of the A. L. A. M. mechanical digests and handbooks, and the general statistician of the association.

In speaking of the preparations for the show, Col. George Pope, chairman, tells of the work in these words:

"In the preliminary stages of the show preparation, engineers measure up the building to make use of all available area for exhibition purposes, considering the comfort and safety of the public as to passageways and regular and emergency exits.

"Then the architect studies the building, to get from artistic standpoints an harmonious decorative scheme, in keeping with the floor plans of the engineers; lending itself to the practical side of a trade exhibition.

"Then follow the constructing builders, to overhaul the building, to bring about the required result. Then the work of preparation divides itself into two great divisions, one of which involves almost endless communications with the trade regarding space, the preparation of thoroughly indexed rules for the conduct of the show, just to the large and small exhibitors and the management.

"Above all, a high standard is maintained. Exhibits which could reasonably be considered freakish or of negligible interest, or irrelevant to the needs of the motorist, are prohibited."

M. L. Downs, secretary of the show committee, calls attention to the pessimism which existed in the early days of the automobile and how many people regarded the first exhibition which took place in the Garden. While they looked at the meager supply of cars they expressed the belief that the "fad" would not last as long as the bicycle, but they could not foresee the marvelous advances in manufacturing methods. Here is what Mr. Downs says:

"In the early days when automobiles were first struggling for recognition in this country, one of the pioneer companies took a small space in a corner of a bicycle exhibition and showed two cars therein. They excited a great deal of curiosity, yet at the same time were laughed at by the majority of the public as being impractical and simply a dream and toy of the rich that never would be of any use for ordinary purposes.

"Not many years have rolled by since that day, and many of the scoffers of that period are now enthusiastic automobilists.

"Instead of the man dressed in sweater and knee-breeches, bending low over the handle-bar of his bicycle, working hard for every foot of ground that he covers, we now find him taking his ease, sitting in a luxuriously upholstered car, going here and there at will, covering long distances that in bicycle days were looked upon as impossible. The automobile has made possible the pleasures of a country home, with all that it means, and yet allows a man to conduct his business in the city."

In the running of a show it is always a mighty good plan to have a good press agent, and here's a sample of what A. N. Jervis recently supplied in the way of word painting:

"The hoisting of the circus tent and installation of the animals, to watch which the small boy plays hookey from school, is no more interesting to him than would be to an adult a similar exhibition of complicated activity in the work of preparation that is now in progress at Madison Square Garden. The annual automobile show, which opens at the Garden next Saturday night, has come to be the particular event for which the big amphitheater is most elaborately decorated and generally transformed. The show managers of the Association of Licensed Automobile Manufacturers are now in possession of the Garden, and the carpenters, decorators, electricians and painters, with their assistants, to the number of ten score, are overrunning the place from cellar to rafters, all as busy as sailors getting a ship under way. At first glance it looks like a terribly confused activity, but a little observation shows organization in half a dozen different directions and orderly coherent co-operation that will quickly bring the scheme to completeness and beauty. The show is to have more exhibitors than ever this time, about 325, and the wits of the planners have been taxed to provide for them, but it will all seem to have been easily done when the big crowd surges in on the opening night."

ROSTER OF THE A. L. A. M. FOR 1909.

Herewith is given the latest complete list of officers, committeemen and others officially connected with the Association of Licensed Automobile Manufacturers. The list is a formidable one and contains many men who are pioneers of the automobile industry:

The A. L. A. M. has headquarters at No. 7 East Forty-second street, where the regular monthly meetings of the association are always held. Messrs. Chalfant, Downs, Clarkson and Cuntz are invariably in attendance at the New York offices.

WHERE THE EXHIBITORS ARE LOCATED

VISITORS to the Garden show will be most agreeably surprised at the neat, clean layout and distribution of exhibitors, which is in marked contrast with some previous exhibitions. The distribution is such as to give the impression of a vast space not uncomfortably filled with cars, thus allowing plenty of room for visitors. This is so cleverly done that in reality the effective floor space is very little less than last year. The tables below will show where the exhibits may be found in which the following key will be found useful. The letters in every case are an abbreviation of the words: M.F., Main Floor; E.P., Elevated Platform; E.H., Exhibition Hall; B., Basement; Bal., Balcony; S.T.B., Second Tier Boxes; T.T.B., Third Tier Boxes. The very small number of exhibitors upon the main floor, namely, twenty-three, will be noted as bearing out the idea of plenty of floor space.

ACTUAL CARS ON EXHIBITION AT THE GARDEN

STANDARDIZED automobiles, in so far as the word can be made to apply to any industry that expects to keep step with time, is the proper phraseology to apply to the cars for the Garden. Even a cursory examination of the tabulation given in conjunction with this discussion will be enough to convince anyone who may have been at all familiar with the situation that the A. L. A. M. has gone into the matter on a basis which has for its underlying strata the standardization of the parts, and, to the extent possible, the standardization of the types of cars.

In some respects it is quite out of the question to gain headway in the matter of fixing upon standards, especially if reference is had to certain special applications along lines in which deviations have to be made to suit local conditions. On the other hand, it is better to try to crystallize the cars than to go on making things different year after year, with the full assurance that all the changes cannot possibly be right, any more than it is a fact that every man who goes into business will make a go of it.

In car building it has long been the custom to follow standards, and the M. C. B. (Master Car Builders) rule is followed in the design of all the devices that can with safety be reduced to a standard, without throttling the progress that is so important in any industry. The argument has been advanced to the effect that standardizing will tie the hands of designers and throttle genius. In this connection it would not be out of order to say that the designer who could be so easily flagged would scarcely be capable of evolving anything that an autoist would want to pay money for. Then, there is the success of the M. C. B. to be noted. Certainly, railroad cars were not reduced to anything but quality as the result of standardizing, and it is not easy to show anything but advantage from the process. Indeed, not only the quality of the work and the cost, but the progress made can be directly traced to the fact that the M. C. B. did regulate in so far as standards can be fixed and up to the limit of the ability of a body of representative men to agree.

The Garden cars will show the result of the several years of careful consideration that they have received at the hands of the engineers, who met on occasions, and in converse exchanged ideas and arrived at conclusions. It is not to be supposed that they agreed on every point, nor can it be said that they used all the ideas that went the rounds. What they did do was to talk it over, and in doing so it is assured that each was the better able to cope with his own problem after he listened to the objections as they were put before him at the hands of able critics of no mean ability.

Garden Show Cars Tried Out.

Of course there are the builders of devices, even automobiles, who prefer to try their product out in public, and even on the public. One might ask, Does it pay? On the other hand, it is rather an advantage of the cars at the Garden that they are tried out. The public does not have to consider this phase of the problem; the same public is in possession of much definite information in relation to the performance of the cars. There is one other phase of the subject that will stand mention in this connection. Take, for illustration, the companies that do bring out new models for the first time; they should be able to avoid mistakes if they have a source of reliable information such as is the case with the companies at the Garden.

On the whole, then, the cars as they will follow do represent the accumulated knowledge of half a decade, pyramided and placed at the disposal of the men behind the automobiles on exhibition. This may be the reason why they look more or less alike. In a word, they are alike in all the standard features on which the engineers could agree in every case in which the cars are for a given class of service. This is not to say that the touring cars, for illustration, are prototypes of each other, though they all have chassis frames of the channel section, with one or two notable exceptions, as Franklin, using the laminated wood frame. All use ball or roller bearings in the hubs of the road wheels, and all follow out certain safe practices in this regard.

Likewise, crankshaft work is on a basis which differs but little between the cars, even if all the cars do not have motors with crankshafts of the same dimensions, although it is possible that all may have limiting values of the extreme fiber strain and all may have kinetic ability parallel to the kinetic work. These are the matters which make the differences in the long run, and unfortunately they are the questions that will be the hardest to put before the buyers of cars in a manner to be convincing.

It will be quite easy to lay bare the body work of the cars of the year, since in this important part of the cars good common sense has taken charge, and the straight line effect in the body work is but a fitting indication of the straightforward work that will be found in about every case under the handsome finish. As a general rule the wheelbase in the 1909 cars is longer than formerly, and this is turn indicates more room in the cars. The lengthening has been in all the types of cars, from the little runabout to the big touring car, with the exception of the town car and taxicab types, where they have been kept short, to give a good turning radius in the congested streets of the cities.

Good Representation of "Sixes."

The power plants in the 1909 cars are well divided, in that there is a fair sprinkling of the "sixes," and the "fours" are in profusion, with the usual number of the "double opposed" and just as many single-cylinder motors as last year. As to the power of the motors, some say the big power plants are on the wane; but it is a case of more of the small-power plants than formerly, not less of the plants of the larger rating. In other words, it may be true that there is a big demand for cars of medium power, to some extent taking the place of the demand for runabout types of cars, but it is also a fact that the users of the cars with the large power plants are in great presence, and they are demanding more, not less, power.

As respects transmissions, the selective type seems to be in the majority, and direct high is the most used combination. Some hold to the progressive; there is at least one semi-progressive; and planetary gears are as before used in certain classes of work. The workmanship is on a high plane, using alloy steel or special grades of steel in about every case. The levers and linkages are well designed, and the materials are good. There are examples of the "left-hand steer" to be seen, and it may be the plan will grow to very wide proportions.

There is a decided tendency to use better wheels, and the rims are largely of the "demountable" or other "quick detach" plan. Spare wheels are used, some with rims only. In other cases the entire wheel is furnished.

THE GENERAL SITUATION IN RELATION TO COMMERCIAL VEHICLES.

A cursory examination of the commercial vehicles at the Garden may lead to the hasty conclusion that the commercial situation is a relatively small compass. Let account be taken of the circumstances under which the commercials are compelled to labor, consider the fact that the exhibition is primarily one for the purpose of displaying pleasure vehicles, and the fact will dawn upon the mind of the observer that the commercials in this instance are merely as a tail to a kite. But if any one thinks the tail is lacking in length, then let it be understood that an indoor show of commercials is rather restricting, and also take heed of the fact that the display of commercials at the Garden is incidental to the "big show."

The commercial situation is vast in its spread and it covers a car for every purpose under the sun. The cars as above listed merely serve as an index of the situation in a general way. If a car is desired for any given purpose it is only necessary to make the want known, and a dozen companies will be able to show vehicles in actual service, doing the work in a manner to leave nothing to be desired. Nor does it matter if the service is something special, something to be considered for the first time; the same companies will give the details of the proposed service the benefit of their experience, and if it presents anything of practical value cars will be fitted out for the work, and the results will be all that reason will demand. Under the circumstances it will not be fair to judge of the extent of the commercial situation based upon the cars in the Garden show, or from the number of commercials as shown in the data sheet here afforded.

The reports emanating from responsible sources in relation to the performance of commercial cars has been very encouraging of late; the extent to which the business is expanding is far more comprehensive than most merchants realize and the old line of strictures will find no resting place in the literature of the day.

MECHANICAL ADVANCE OF THE INDUSTRY

By THOS. J. FAY.

SPACIOUS as the Garden is, and broad, the room is insufficient. The A. L. A. M. comes to town, heralded only by confidence in its ability to display automobiles the qualities of which are not to be spoken of in aught but glowing terms. Not that the cars look any better than the superior types of a time ago, dressed as they were in body work of a quality—if color counts—too good even to last; and there were those who were willing to proclaim a short life for some of them at any rate. If this is the year of the moderate price—and the evidence is at hand to make out a fairly good case—it is also the year of accentuated quality.

In other words, this is the year when all the cars have moved up to a higher level, although there probably is a relation between the respective cars that has not changed so much as one would like. The medium-priced cars as they will be seen at the Garden will represent good value indeed.

The time was, and it was not a long time ago, when all attention was paid to the body work, because the purchasers did not know how to judge of the quality of the machinery, and they thought they could tell a good looking body. The body work certainly did cover a multitude of very grievous sins in many cases, and it would not be wide of the mark to predict that the makers of some of the automobiles knew not so very much more, or they would not have had the nerve to show the cars, even if they were covered up by the bodies, which hid the machinery from the eye of any over-critical purchaser. In these little diversions there was little or no attempt at actual deception, since the builders of cars were doing quite well for the time; nor had the patrons, who stood the brunt of it, any great cause to complain.

It is always the privilege of the public at large to take the experiments of an industry, or an art, and by trying the plans out lend the product of their keen observation to the industry. On occasions, when the public is thus put to work—and made to pay the bill besides—they grumble, and it is not uncommon to hear them say that they are being imposed upon, and some of them go so far as to say they are being robbed. This is all nonsense, since it is necessary to experiment to be able to do things right, in time, and no matter how it is done, it is assured that the public must pay the score in the long run. This same public would have a right to complain were it not allowed to work besides. Of course it is nothing but work to try to make a car run, when, as a matter of fact, there is no run in it. Certainly the men who struggled with some of the automobiles of the past will not deny that the cars at the Garden are positively good!

What the Pioneer Buyer Can Observe.

Is it not now a great honor for any man to be able to say: "I paid good money for a car, and it was one of the first, the quality of which was so stubborn that it would not run, despite the price and the labor I lavished upon it"?

A pioneer who can say this can now go to the Garden, and he will get his money's worth in just a look at the automobiles that will run with the same steadiness as the reverse was true of the cars of not-so-long-ago. A pioneer, in such a position, has something to live for, and he can rest assured that the cars of to-day are the direct result of his bravery, and his blood and money.

It is a wide difference between an automobile in which the respective parts are related to each other in such a way that each will perform its respective part, and an automobile in which it is assured that fully five score of the parts are weak, and that the balance of the members have to struggle with the overload. There is all the difference possible between a car in which each one of the 2,400 parts is stressed in exact accord with its kinetic ability in such a way that they will all fag out at the same day and hour. It will be many a long day ere this will be so. The fact that automobiles look very much alike and have wheels that go around in very much the same way is small indication of the competence of them severally or collectively. There probably is not one absolutely right automobile in the world, and it will be no crime if the next century slips into oblivion without feasting its eyes on perfection by way of an automobile.

This search after kinetic perfection will be a long hunt; it will be up and down the highways and the byways of knowledge, and it will be a "still hunt." In the meantime it is pleasing to note that a certain practical perfection is present in the cars at the Garden, and the men who made the show a possibility should think kindly of the earlier patrons of the industry who paid the bill and kicked so hard about the shame of it. It was the kicks that did so much to advance the industry, and it was the men who paid attention to the kicks that are to be at the Garden with the finest display of cars that the A. L. A. M. ever mustered to the call of the patrons. The call is certain to be answered, too; the patrons are fearing a shortage in number of the cars which command respect.

It would be a fine thing if it were possible so to paint a picture of the situation that all would understand, and it would be possible were the painter of sufficient competence. It is not that the audience is obtuse; it is that the painter has not the skill. Depending, then, upon desire rather than upon skill, it will be to point out a few of the aims for perfection, and the inroads made, in so far as it will be possible to discern them.

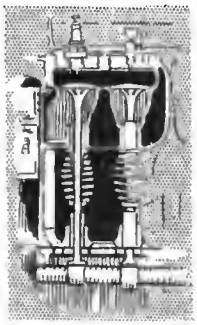
The Relation of Materials to Design.

It was long known that steel, and, in fine, all materials had life; that the life is long or short, depending upon the manner in which they are used. When automobiles first came into vogue it was soon learned that the service was of such a character as to "kill" the steel quickly, if the same was of the ordinary grades to be had for the asking in the marts of commerce. It was learned that materials would survive in service, long or short, depending upon the manner in which they were fashioned, and if the extreme fiber strain was maintained within certain relations.

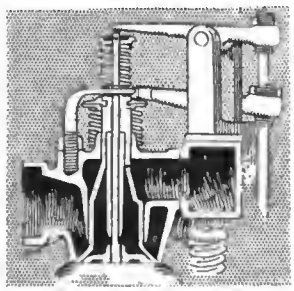
As the industry advanced it was a hunt for materials of a suitable quality on the one hand and a hunt after knowledge of their proper use on the other. Each increment of gain in the direction of better materials was met by an increment of gain of knowledge of their proper use. The result was a gain as the square, or, in accordance with the square law. Each combination of the increments of gain in quality of material, and of knowledge of the proper use of the same, was in

turn put through the same evolution, and the result is a "pyramid" made up of increments of knowledge of the use of materials and of gains in point of quality of same.

Simultaneously there was the elimination of the fallacies—of which there were carloads to spare in the earlier



E.M.F. Valves.



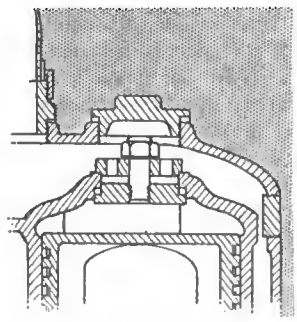
Franklin Valves.

days—and there are a few left. At all events, of fallacies the most bold have been set aside for use by some new industry; nor do they seem to be perishable property. Most of the fallacies came in as a result of the application of "the logic of events." Logic is said to be the chairman of the Ananias Club. Anyway, it is plain that a certain class of logic failed in the automobile business, just as it failed when Col. Sellers tried it on the "Orientals"; there were millions of them, but they were all of precisely the same density, and they all failed to see the point.

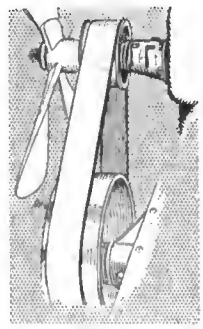
The A. L. A. M. Mechanical Branch.

It is just so with the materials; they failed to work on many occasions, possibly for the very reason that they were the logical conclusions. Equally there were a crop of designs that for result did but fittingly illustrate the application of what is sometimes called a zero equation. The A. L. A. M. must have foreseen much of this when the mechanical branch was organized, for in that act is to be seen an attempt to pyramid knowledge, to be accomplished by the discussion of current events, and the concise compilation of the facts resultant from the combined knowledge of the engineers of the several associated companies. The natural result was that materials were improved, and the proper use of the same followed.

In the cars at the show will be found the product of thus pyramiding the knowledge of men, and the materials



Pierce Cylinder.



Haynes Fan Belt.

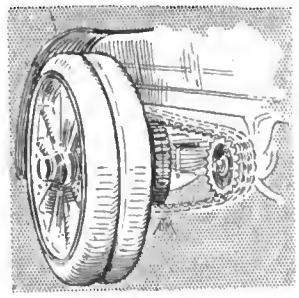
are far more capable than ever before. Even without the great improvements in materials it would be possible to foresee that great gains would be the result of thus combining effort, for then harmony in design is bound to follow, and this is a matter of far more importance than the improvements in the qualities that do, in materials, reside. It is possible to conclude that an harmonious design, even if the materials are bad, will result in a prolonged life, since, if harmony is a phenomenon, each part will bear its own burden and none will be destroyed in the process of doing its neighbor's work.

In a sense it is a great misfortune that materials cannot talk in a language that can be readily understood by men of ordinary skill and understanding. On the other hand, these same materials have a language of their own, and it is the business of the engineer to understand that language. It was one of the ideas of the Mechanical Branch of the A. L. A. M. to interpret the language of the materials used in automobiles, in order that, when the materials would complain of a killing burden, something would be done to relieve the situation.

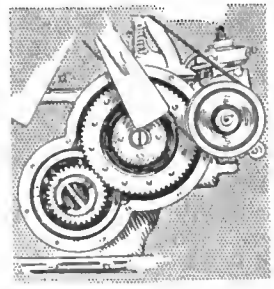
The Language that Materials Speak.

In this way the situation has been relieved to a vast extent and the cars so treated have advanced until it is a moral certainty that ten years of cut and try would not have done a quarter of the good, that is but the finished task of less than five years of pyramiding on the part of the designers of the cars as they are to be seen at the Garden. As it is to-day, the complaints of materials are comparatively few, and it happens to be the case that users of cars are stilled by the very process that rendered the burden fair.

Formerly it was the practice to consider that materials could be sized up on a basis of certain conventional physical



Silent Chain.



Chalmers Time Gears.

properties, as tensile strength, elastic limit, elongation and reduction of area. True, it was the practice to take into account the compressibility and one or two other phenomena under certain conditions, but the point to be made is, that it was a static basis of fact that received the most, if not all, the consideration, in nearly every case, to the entire neglect, one might say, of the life of the steel, or such other material as may be used on a basis of kinetic loading.

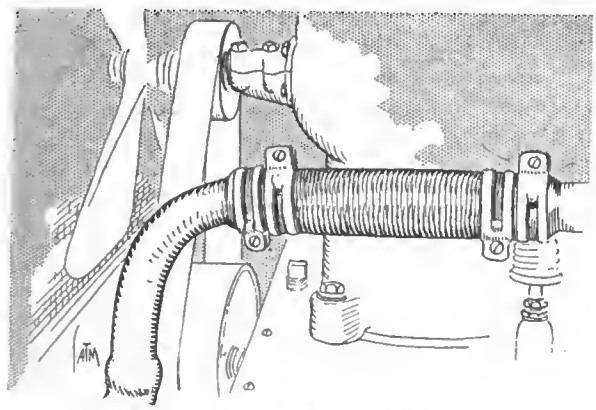
When the Mechanical Branch took hold of the matter it was at a time, just after independent investigators had conclusively shown that the American makers of automobiles were under a handicap, due to the use of inferior materials. It was slowly brought to the notice of the builders of cars that the foreigners had it largely their own way, due to the fact that the foreign steel makers were in the habit of co-operating with the users, on a basis to bring about the best result, while in America it was the practice of the steel makers to "hoot" for quantity and let the quality follow as best it might.

When the A. L. A. M. began to look into the matter it was quickly found that a laboratory was as necessary as the materials, and the diversity of thought that found expression had to be classified even to the extent of culling out much that may have been of abstract value, which could not, for certain reasons, be taken into account in

connection with automobile work. The laboratory was established, and that it was fairly well fitted out is apparent from the results attained in being able to talk to the materials, as it were, thereby to ascertain their wishes (ability), with a view of locating them in the places they might serve to the greatest advantage.

It was soon found that materials could not be used to advantage on a basis of the static tests, nor was it determined that the steel makers were so much interested in the quality of the material as they were in the price and in the quantity that they could get on order. It was a case of quantity taking precedence with them, and quality was at a low ebb. Having fitted out to be able to fix upon the qualities of the materials from the point of view of their kinetic ability, the next step was by way of culling out the materials that were so very inferior as not to be given consideration at all. From this point to the time when the laboratory was enabled to state with fair certainty what could be used in automobile work was at the expense of a long series of tests, and of uncertainties there were many, to be reduced only as the product of repeated tests.

When the materials that would serve the purpose were arrived at, then came the question of finding the mills that would furnish them. This may look like a simple matter, but it can scarcely be regarded as such in view of the experiences that followed attempts. That the mills



Haynes Flexible Water Hose Joint.

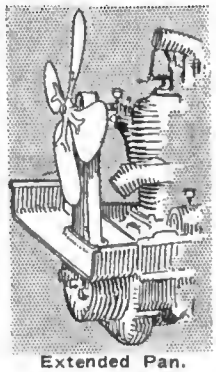
regarded themselves as the sole judge of quality is assured, and in a sense they were right, for in many cases the materials were so inferior that none but the fabricators could unravel the tangle.

Sending orders abroad was the only expedient for a time, and this was the process to bring the mills to a sense of the uselessness of trying to dam up the situation with materials not stout enough to accomplish the purpose. Once the makers of materials found that the foreigners were hungry for business, it was as an appetizer for them, and they did respond in a manner that prevented the whole business of furnishing automobile materials from falling into the hands of the mills in France, Germany, and England.

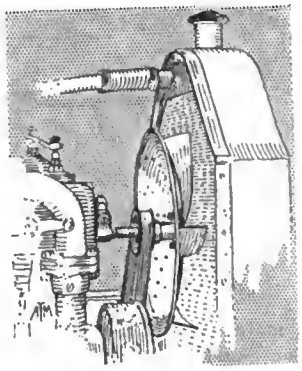
The Standardization of Parts.

With the question of the materials in a fair way to be disposed of—in time, at any rate—the next question was one in which an attempt was made to arrive at stadnards, more particularly in relation to parts, hoping that in time standards of units might be fixed upon as well. Certain of the drop forgings, and bolts and nuts were handled in this way, and the industry was benefited marvelously by the results of efforts along these lines. In relation to the standardization of units, it is enough to say the problem is formidable, and it may take even years to bring about anything like a standard. On the other hand, it was possible to establish a horsepower formula that did serve the purpose, in that it put all the motors of the same general type on a common footing, and enabled the makers of cars as well as the patrons of the industry to decide with more or less certainty as to the fairness of the ratings of motors and the power for weight of cars.

Then it will not be too much to say that the cars at the



Extended Pan.

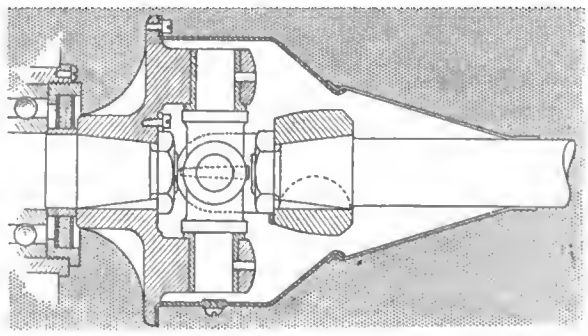


Fan-Blades on Shield.

show do represent, in a most substantial manner, all that has gone before, including the work of the mechanical branch, in the endeavor to arrive at a fitting standard of the materials used in the cars, and the way the parts should be whittled out for the work to be done. Purchasers will be enabled to see in the cars at the show all the concentrated effort of the designers, not only as individuals but collectively. As individuals, the designers were enabled to show the individuality which is never destroyed, even when it is lashed down to conventional standards born of experience.

The elimination of traces of the old buggy idea and the overhang in front was in process last year. There were evidences of short wheelbase to be disposed of, which in the earlier days indicated a desire to make the most of it, resulting in a cramped design, while the saving in cost was small, if such there was. In other words, it was difficult to cut loose from environs of the past, and it was not until the 1909 cars were put out that the up-to-date automobile was an assured fact.

As it is, the radiator starts at the front axle, and the body relates to the chassis in a manner to accord with the most approved ideas on the subject in all lands. In former times one could not be sure that the hood covered a motor at all, and even in cases in which the motor was under the hood it was frequently that the hood was far in excess of the needs. In a word, there was not the fine regard



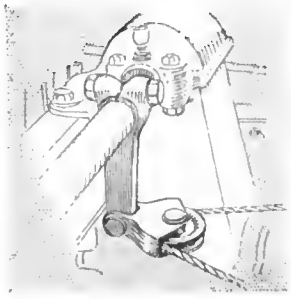
Grease Tight Pierce Universal Joint.

for truth and simplicity such as will be found in the cars at the Garden at the present time.

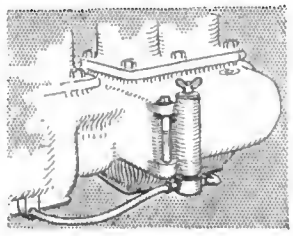
As respects the motors of the year, it is to note a grade of workmanship the quality of which is head and neck over the efforts of former times. Take the cylinders, for illustration; it matters not what may be the type, the

design is free from the minor errors which were once regarded as too trifling to be eliminated at the expense of a set of patterns, the cost of which is so great as to make short work of a five hundred dollar bill.

In the crankshafts will be not only the finest selections



Simplex Equalizer.



E.M.F. Oil Well.

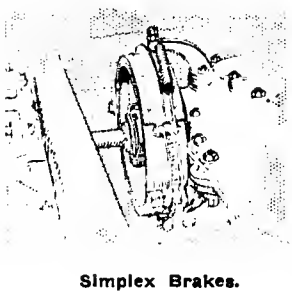
of materials, but designs quite in keeping with the knowledge gained at the cost of much skill and through the use of a well-equipped laboratory. Then, again, it is a fact that the fashioners of the forgings arose to the occasion, and the forgings were properly made for the service to be rendered, despite the fact that it cost thousands of dollars to fit out in a manner to be able to do the work.

In aluminum castings will be found a vast improvement over the work of even a year ago. To-day the castings are not only more in keeping with the shapes that lend strength, but the material is of far greater strength, which is not so important as the fact that the average strength is very much higher and the "wasters" are but few. It is never so much a question of the maximum possible strength of parts as it is the chances of some of them being below the safe limit. Aluminum was most uncertain in this respect, and it is in this direction that the greatest advances were made.

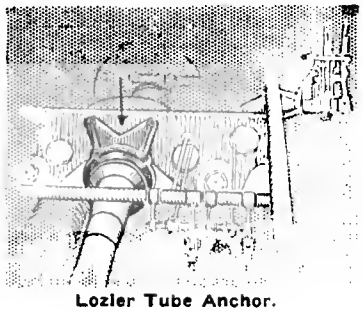
In the matter of noise, the improvements wrought represent a most noticeable difference, due to fine discriminations in design and the more perfect proportions of the valves, valve motion and relations, thus assuring the proper performance of the valves for the purpose, which is the matter of first importance. Fortunately, with the perfection of the valves, the noise disappeared.

Utilization of the Power.

If it is true that the motor work is on a basis of great stability, it is a fact as well that the clutch work is on a higher plane. The time was when it did look as if the clutch situation would fail to respond to the wiles of designers. Persistence and experience lent the necessary



Simplex Brakes.

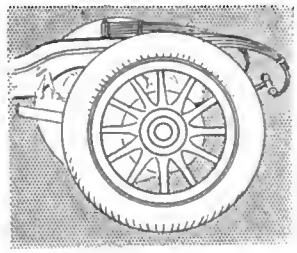


Lozier Tube Anchor.

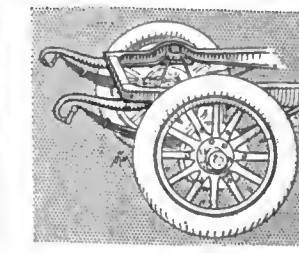
charms, and it is now assured that clutches will do the work in a manner to leave nothing to be taken for granted. In the earlier struggles it was thought that the types of clutches were most at fault, and changes were frequent. To-day it is recognized that all the types of clutches will work if they are properly designed. Some will take of skill more than others, but the skill is on tap.

Cardan shafts are now not only of the right kind of material, but they are designed in a manner to abort all tendencies to deform under the most severe conditions. If universal joints are used, they are on a fitting plane, and the means for attending to the lubrication is as adequate as the manner in which the "grit" is kept out of the joints. In the cases in which the power plant is on a basis of separate units, means are provided for the quick removal of any of the units, as the clutch or the gearset. It is also true that the motor can be lifted out of the chassis without having to remove the other parts. In many cases this is brought about by means of a suitable slip-joint, and in other cases it is a feature of the clutch. At all events, it is true that the units can be removed in the designs using separate units, while in the self-contained plants it is not necessary to consider the point.

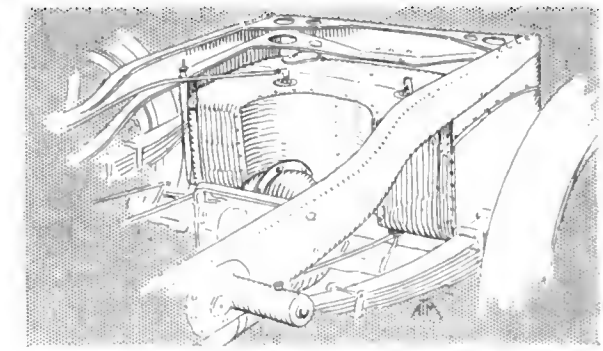
Transmission gearsets are on a high plane, some of which are of the "progressive" and one is "semi-progressive," but the great majority are of the "selective" types. True, planetary gearsets are used in numerous examples. Gears are of alloy steel in most cases, but it is a fact that good results are due in some notable instances to the use of "special steel" put through a suitable heat treating process. The linkages and the lever control systems are



Chalmers Rear Spring.



Curved Chassis Frame.



Showing How Differential Clears Lozier Tank.

in a high state of development, using special steel, of marked rigidity and die-forged. Left-hand control, by the way, is here in some force.

Brakes are of the kind that work, nor do they reduce to decrepitude as the result of sliding down a hill, as once they did. In many cases the brakes are all on the (rear) road wheels; the drums are of large diameter, the face is wide and the shoes are devised in a manner to assure long life, as well as the requisite ability. Facings for brakes are divers, as usual; some are metal to metal, more are "cork insert," and the new idea, using "asbestos" fabrics, is well represented. In brakes, too, the means for applying pressure are better, and the bearings are not now unduly pressed in the process of applying the brakes.

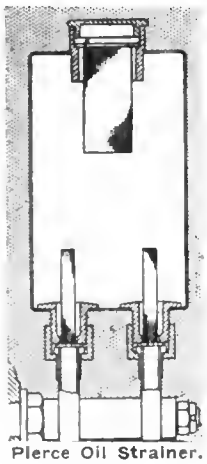
Springs, once the bane of the autoist, due in a large measure to lack of good design, together with the fact that the materials were good for certain purposes, among which automobiles cannot claim an assured relation. As

it is to-day, in view of advances in materials, and in the mode of heat treating, as well as the perfection of design, the spring situation is far advanced.

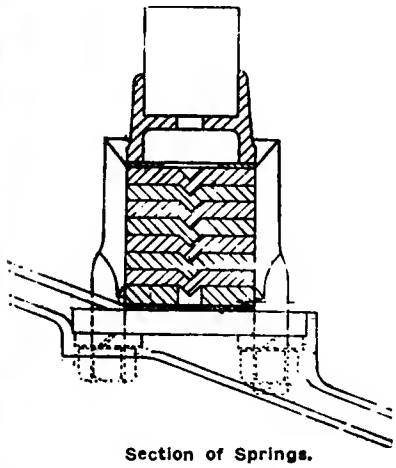
The Several Types of Motors Extant.

All but the "turbine" will be found at the show, displaying their respective advantages, under conditions to bring about a lucid exposé, in order to tell interested patrons just what the year has done by way of improvements. Any attempt at predicting the supremacy of the one over the other in the types of motors is as a waste of time, on the ground that all serve the purpose for which they were designed in a manner up to the needs of the occasion, and to the entire satisfaction of the adherents—nay, advocates of the generic types of motors.

The Air-Cooled Motor.—Air-cooling looked so reasonable and logical in the early days that the idea took root and prospered, despite the difficulties that beset the plan. It was known long before the automobile was taken seriously that air cooling could be maintained in connection with the motors if the bore of the cylinders was limited. On the other hand, it was then supposed that excess heat would beset the plan in any attempt to increase the bore, or gain in power in any other way if displacement was to be the basis. When the



Pierce Oil Strainer.

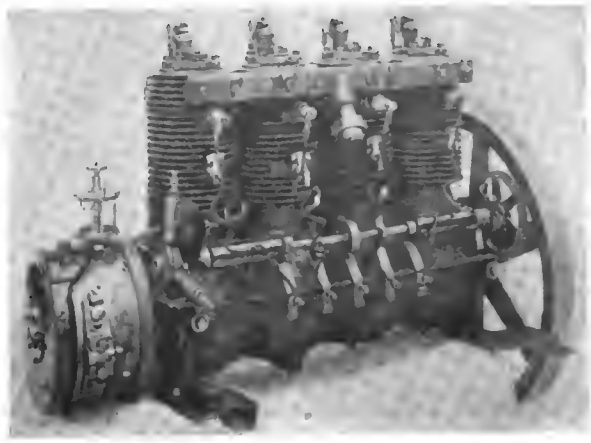


Section of Springs.

Franklin first came out the size of the motor was commented upon, in many cases unfavorably, since it was not quite in accord with the "untried" theories of the day. But the Franklin went about its business in a way to surprise the "natives," and despite the croaking of the theorists (?) it has been going ever since. As it is to-day, the Franklin company has a "six," and it ranks with the cars of the class, with never a thought of air cooling unless to point out that it works quite well enough to satisfy the school of autoists who deem an air-cooled motor suitable for their needs and who will take the ground that they do know what they want and act for themselves.

Certainly the autoist who does not take kindly to "plumbing" favors the air-cooled motor, and in the Winter time it is quite up to a fitting standard, while in the hottest Summer weather it does work so well that the builders of this class of cars depend largely for their business upon the very customers they dealt with from the start. In other words, the air-cooled motor has maintained itself under more or less hostile conditions, maligned for the most part by the men who always maintain that they would not be found dead in a car with a motor of the class. The question is, What do they know about it, if they decline to benefit by experience?

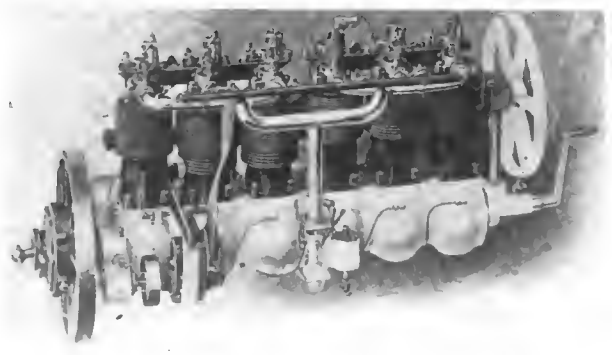
In recent times the air-cooled situation has gained in converts to a considerable extent, and in taxicab work in particular it has made a notable advance. Several companies now handle the air-cooled situation, and the industry has taken on an impetus that is a fair measure of



First Franklin Motor, without Auxiliary Valves.

the fact that it is here to stay. If the air-cooled motor has anything against it in its own sphere of activity, certainly the industry is slow to find it out. On the other hand, failures due to the lack of knowledge of the application of the principle cannot be charged to the successes that may now be seen at every hand. In recent times it may be said that a better appreciation of the fine points in design had much to do with the success of the motors of the type, and it has been admitted that the air-cooled motor requires skill to a degree not present in motor work in general.

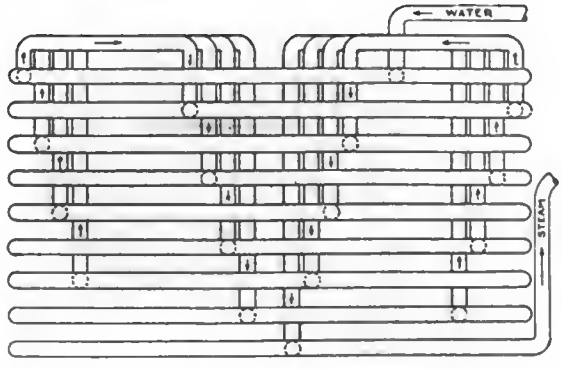
Stability of the Steam Car.—Flexibility is a word which when applied to the steam car situation loses none of its potency. Adaptability, therefore, is a natural sequence, and desirability is portrayed in the very strength that enables the steam car makers to maintain a certain supremacy, despite environment. Force of numbers is oftimes the main strength that beats against a more or less righteous minority, and as water will wear away the hardest stone, so will quality be swallowed up in the meshes that surround it. Taking all the circumstances into account, it is to reach the conclusion that the steam car situation is one of masterly strength despite the limits imposed.



Late Type Franklin Motor, with Concentric Valves.

To begin with, a steam car is nothing if the steam generator is not of the greatest efficiency and of a character so stable as to leave absolutely no problem unsolved, if the same is in relation to safety. The White generator is illustrated, and to more clearly depict the points of

merit a diagram of the generator is also given. The generator is made up of a series of coils of steel tubing, superimposed and connected in succession. In other words, were the coils to be straightened out the whole would be as a long length of steel tubing. In operation, water is pumped into the upper coil, and steam issues from the



Section White Generator, Showing Water Circulation.

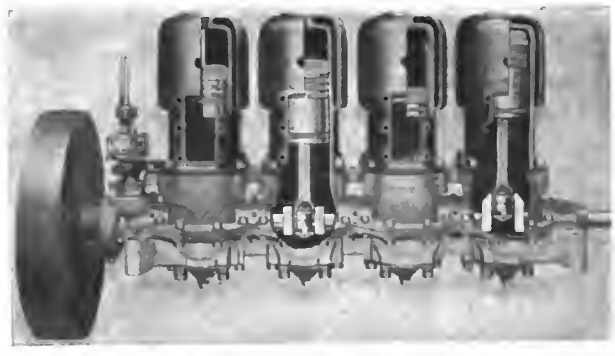
lower coil. In a word, the water does not hold as such throughout the length of the coil, and the amount of water in the coils at any one time is less than the amount, which, if all were elevated to the steam state of aggregation, and raised to the highest possible pressure consistent with the means afforded, there would not be enough water in the system to generate the requisite pressure to damage the generator, much less to cause the slightest departure from feather bed safety. The White system, then, does not take into account a large amount of water in a boiler, under pressure, and prone to flash into steam, thus chancing an explosion. The long length of steel tubing, about 1-2 inch in diameter, is there for the purpose of making steam as the same is wanted, and the means afforded for the proper regulation of the influx of water represents, in all truth, the mode of control.

The Two-Stroke-Cycle Motor.—This type of motor can be either air or water cooled, allowing that the designer is capable of coping with the several problems at the one time. However, it is not usually the case that two-stroke-cycle motors are air cooled as well. As a rule, it is the idea to favor the two-stroke-cycle motor to the greatest possible extent along lines in which the question of scavenging is considered to be the matter of the first importance. Taking the 1909 automobiles for it, there is ample evidence

White Generator, Showing Coil Connections.

of the fact that the two-stroke-cycle motor is gaining converts among the autoists who do not care for valves, the requisite motions, and the chances that go with them by way of leakage. In the earlier attempts to build motors of this class it was made apparent that flexibility would be a little difficult of attainment, for reasons that were variously stated at the time. It may come as a surprise to many, then, to learn that in the motors of the class the question of flexibility is settled in favor of what may be well termed a fine performance in this respect.

The motors of this class promise much in commercial work in which the class of labor is not of the mechanical turn of mind, and of mechanical things complication is the least to be desired. In any zone of activity the least of two evils is the one to choose, and simplicity is the first requisite in commercial work. As yet the motor of this class has not been used to any great extent in buggy service, but it should have a demand in this direction if it is a fact that this is the service in which there is the greatest need of simple devices. Certainly it is true that the two-stroke-cycle motor is simple. Of this class of motors it is too soon to say which of its subdivisions will ultimately prove to be of the greatest advantage. As is well understood, the three-port motor is even free from the complication which comes from having to use a valve in the crankcase, and in this way the motor becomes truly "valveless." In the two-port type the valve is an "automatic," and its function is to entrap the mixture after it is sucked into the crankcase. On the whole, taking all things into account, the Elmore has maintained a standard of excel-



Elmore Two-Stroke Cycle Motor, Shown in Section.

lence, using the well-known Elmore two-cycle motor, and the only complaint ever made was that the company failed to turn out enough cars to fill the demand. This is in the face of the fact that the Elmore plant is pretentious.

Trend of the Water-Cooled Motor.—This is mostly a question of the location of the valves. The T shape was regarded as standard until very recently, but it is now a question if the T shape has maintained the supremacy which it promised. In many cases there are splendid types of the L shape, in which the advantage of a single camshaft is displayed; then there are motors in which the valves are in the head, using a superimposed camshaft. The Knight motor was of America, but it emigrated, and is now to be exploited in this country by the British Daimler Co., and in it will be found a variation of the water-cooled type of motor in which valves are used, although it is true that the Knight motor was once regarded as valveless. In this connection, it may as well be said that the valves are there, by way of sleeves, instead of the conventional "poppets," and the future will tell if the plan is superior.

What of the Gas Turbine for Automobiles?—Completeness demands mention of the gas turbine, even if it is true that the Garden will have none of the type. That the turbine is possible is now becoming more apparent, and, just to be up to date, it will be the idea to call attention to the fact that experimenters are figuring upon the introduction of the type. But it cannot be stated that the "turbine" will be in much evidence for many years to come.

ILLUSTRATED WORD PICTURE OF THE CARS

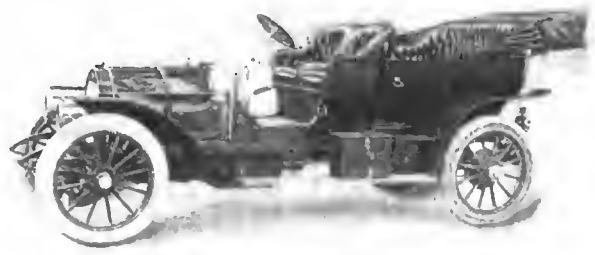
AUTOCAR: The Autocar Co., Ardmore, Pa.—By way of pleasure cars this well known company will exhibit at the Garden its model known as Type XX, which is a four-cylinder car of the latest and most approved design, in which the ignition is with a Bosch magneto, and the transmission is of the progressive three-speed type. The wheelbase is 102 inches, and the wheels, of a very comprehensive design, are fitted with 34x3 1-2-inch pneumatics. The baby tonneau on the model at the show is well inclined toward the zone most fittingly referred to as "finality," and on the whole it is easy to account for the interest that will center around the exhibition of the Autocar. In addition to the chassis as above described, the exhibition is most complete in other ways, and it includes bodywork as follows: A landaulet which will be found of splendid proportions and artistic in the extreme; a town car design, and a taxicab, as well as a victoria. Especial mention will be made of the fine appearance of the last-named body, in view of the high art depicted in its graceful lines. The whole exhibition of the Autocar, taking it collectively, renders it easy to reach the conclusion that the company is alive to the 1909 needs from the autoist's point of view, and to meet them

Autocar, 18-20-Horsepower, with Touring Body.

constitutes the sole ambition of the company. The mechanical work on the chassis and all its parts is well up to the high standard of workmanship which has always characterized the output from Ardmore.

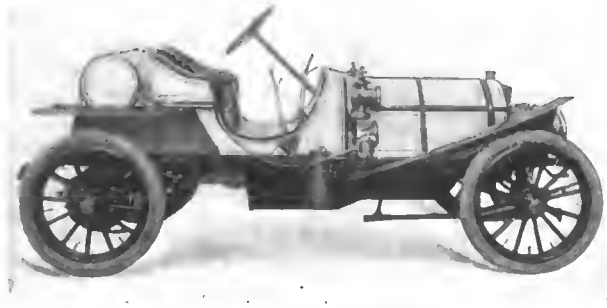
APPERSON: Apperson Bros., Kokomo, Ind.—The "Jack Rabbit," good for 75 miles per hour, from the Apperson borough, is a four-cylinder car rated at 50 horsepower. "Big Dick" belongs to the same family and is intended for the autoist who wants to go 90 miles per hour. This car also has a four-cylinder motor and is fitted with a runabout body. As a general proposition, it is likely that the Model O Apperson is the car which the average autoist will be the most interested in. The Model O is a 30-horsepower touring car, of the latest and most approved make, fitted out in a manner consistent with the advances in the art. This car is of the four-cylinder class, and among other special features are I-section vanadium steel front axles and a floating type of rear axle, so designed as to allow of the utilization of "plumb spoke" rear road wheels. The transmission gearset has special features, among which attention will be called to the absence of joints. The case is of aluminium and in one piece. The bearings are of the "two row" ball type, and it is interesting to note that the camshaft can be withdrawn from its nest in the motor case. Noiseless performance is one of the claims of the Apperson.

CADILLAC: Cadillac Motor Car Co., Detroit.—From the single-cylinder Cadillac to the four-cylinder proposition for 1909 is a great distance, and yet the single-cylinder car has a wide field of usefulness and is the favorite of very many autoists. The new "Thirty," however, represents automobile value as it will probably remain for some time to come, on the ground that the price, $1,400, for the car is a proposition in which



Apperson, Model O, 30-Horsepower Touring Car.

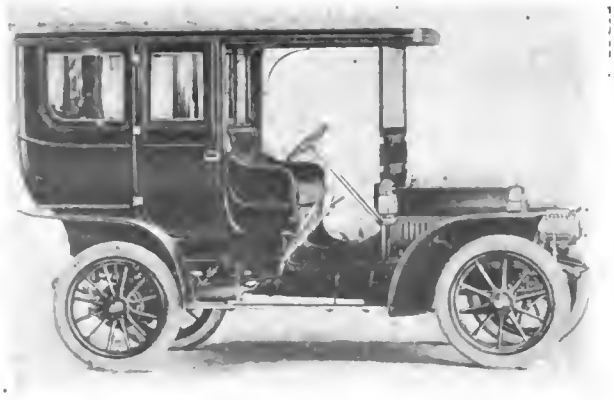
merit has a permanent residence. The four-cylinder "Thirty," like all Cadillac motors, is with certain special features such as have long been regarded as Cadillac earmarks. The cylinders are "individual," and the water jackets are copper, so securely put into place as to defeat any trouble from this source. The method is a guarantee of even walls of the cast gray iron cylinders proper, and, as would be natural to the method, the cylinders may be critically inspected all over. The Cadillac "Thirty" is a great big, full-fledged automobile, of fine appearance, but this is a fact that a mere inspection at the show will ade-



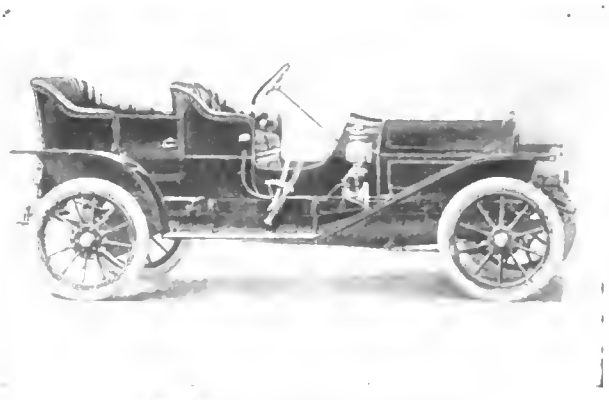
Apperson "Jack Rabbit" 50-55-Horsepower.

quately settle. The power is there, and the parts are accurately made. The castings and all the work, as well as all the other parts, even including the radiator, carburetor, etc., are made in the Cadillac plant under the supervision of the company.

CHALMERS-DETROIT: Chalmers-Detroit Motor Co., Detroit.—The 40-horsepower car of this make is so well known as not to require further mention, but it will be well to especially call attention



Cadillac Model G, Limousine Body.



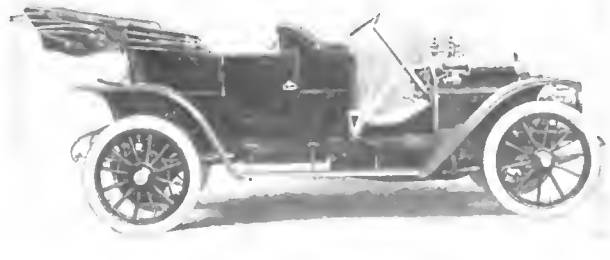
Cadillac "Thirty" Demi-Tonneau.

to the "Thirty" for 1909. The car in touring form is with a commodious body of artistic design, with the wheelbase 110 inches, so that the space afforded is adequate, especially in view of the fact that the motor is with cylinders cast "en bloc," thus making the motor very short and in this way adding to the available space. The crankshaft is of the ball-bearing type, using two bearings, and the section is accordingly increased to handle the strains, not without using the finest materials for the purpose. Since the distance between bearings is no more than would obtain with three bearing crankshafts as they are generally to be found, it is plain that the elimination of the extra bearing is to no disadvantage, if indeed, it may not react in favor under the conditions in which the car of the subject was brought to a successful issue. In this car the transmission system is of the selective, three-speed type, with a position finder that does the work without any chance of fumbling. The oiling system is very nicely worked out, and a "tell-tale" affords all the information required to enable the operator to feel sure that all the bearings are profusely lubricated. The car is a shaft drive, and the workmanship throughout is up to a high standard.

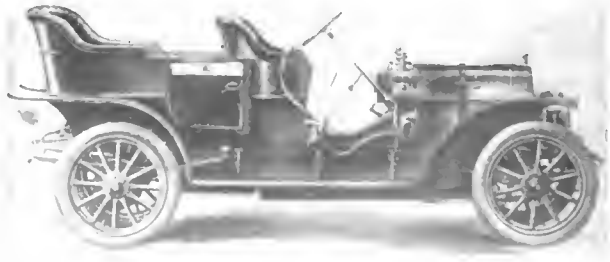
COLUMBIA: Electric Vehicle Co., Hartford, Conn.—The 1909 offering of this well-known company includes a gasoline automobile, known as Mark LXVII. This car is of the four-cylinder, water-cooled type, as is usual with Columbia work, and in a general way it will be proper to say this car conforms quite closely to the various Columbia features in its gasoline work, as will be found in the product for probably three or more years back. It is true, however, that many little details were brought up to date, and the materials used are those of the present time, in the light of modern knowledge of the subject. In Columbia work much has been done by way of standardizing the units of construction, and the chassis, for illustration, is of uniform dimensions in all the cars as turned out. All the types of bodies are therefore alike in the essential dimensions, and in all particulars the parts conform closely to a fixed standard. The motor is equipped with Bosch magneto; Hess-Bright ball bearings are used in every place requiring ball or roller bearings, and all along the line the same high quality of materials will be found.

CORBIN: Corbin Motor Vehicle Corp., New Britain, Conn.—Departure from previous design is by way of such refinements as experience dictates, coupled with the fact that there were certain advances made in the qualities of materials, and the Corbin includes them. Models K and R are with a common power plant, in which water cooling is used, as was the case formerly. The motor is rated at 32 horsepower, and among the special features will be found a nice arrangement of the camshaft gears, and the housing is complete and effective. The interior of the crankcase is accessible, and the valves are nested in a very simple and desirable way on the left side of the motor, where are also the auxiliaries. Among the Corbin features that identify the line from the "flock" will be mentioned the silent valve motion, brought about by the use of intermediate levers between the cam-faces and the tappets; wear is thus reduced to a minimum. The chassis frame is reinforced to assure entire freedom from deflections, and the flywheel is housed in by a suitable contour of the crankcase. The front axle is of the design in which a pivot bearing is used on the knuckles and the front connection of the steering linkage is to the back of the axle. One more point lies in the fact that the propeller-shaft is fully enclosed, joints suitably lubriacted.

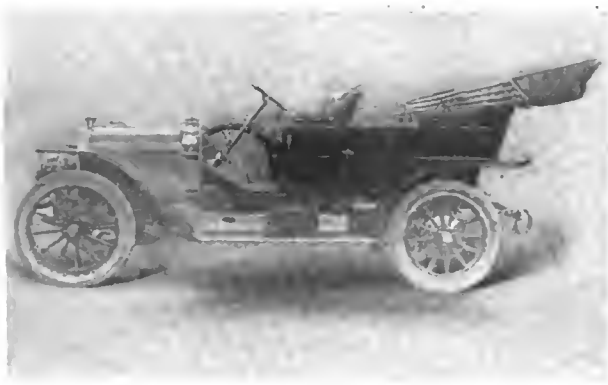
ELMORE: Elmore Mfg. Co., Clyde, O.—The two models for 1909 are known in the trade as Model 33 and Model 44. Model 33 is with three cylinders, while Model



Chalmers-Detroit "30" Touring Car.



Chalmers-Detroit "40" Touring Car.



Corbin Model R, 32-Horsepower.

E-M-F Model 30 Touring Car.

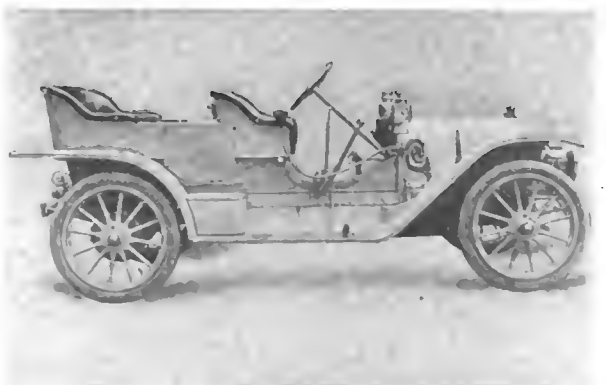
44 has four cylinders, and the motors of both are of the two-stroke-cycle genera. This is an Elmore feature, and great stress is laid on the fact that with the two-stroke-cycle valves are eliminated and a noiscless performance is assured. Then, again, there is the absence of valve grinding to be taken into account; moreover, the Elmore designers point out that leaky valves do more to reduce compression and, in consequence, power than any other feature in any type of motor. In these cars the crankshaft is offset, and in many ways the line has been amplified. The Atwater-Kent ignition system is used, and this is brought about through the use of a countershaft just back of the flywheel, instead of at the side, as in the 1908 models. The tonneau on both models has been lengthened, and the quality of the work in the body conforms to the high character of the workmanship in the chassis.

E.-M.-F.: Everett-Metzer-Flanders Co., Detroit.—The valves in the motor of the "Thirty" are 2 1-8 inches in diameter and the cylinders are 4 inches, so that the valves are over half the diameter of the cylinders, and thus will it be known that in the motors of this make the valves are very large indeed. At $1,250 this "Thirty" is one of the surprises of the year, particularly if account is taken of the fact that it is in every way a standard tour-car, both in point of size and in utility, fitted with every device known to the art, even including a magneto in the ignition system. The rear axle is of the type in which an expanded tube is used instead of castings and drawn steel tubing, and the ground clearance is adequate, in view of the fact that the bulge is not so great as was formerly the case in older types of live rear axles using ponderous castings for the purpose. The front axle is of the I-section of a fine grade of steel, die forged in one piece, and the turning radius is adequate, notwithstanding the fact that the designers were enabled to eliminate the "narrowing" of the chassis frame. The rear springs are of the elliptical (scroll) type, and the easy riding qualities resulting are as good as the fact that the springs are free from breakage, even under conditions involving considerable road inequalities. The cars will be well examined at the show, for the public has pricked up its ears.

FRANKLIN: H. H. Franklin Co., Syracuse, N. Y.—It was in 1892 that the Franklin company made its first venture, placing upon the market a 7-horsepower air-cooled car. From that day to this the Franklin has been at it hammer and tongs, so to speak, with never a thought of departing from the air-cooled proposition. For 1909 the company will be mostly confined to the delivery of three models, as follows: G-4, D-4, and H-6. In the "six," which is Model H-6, will be found all the concentrated experience of the Franklin staff, and among other details of note is the fact that the car is very light, yet withal it is strong. The 42-horsepower motor is therefore not overworked, and the power for speed is in that relation which counts for hill climbing ability or speed, at the dictates of the owner. This year the engine governor will not be used on Franklin models, but the ignition system includes the "Bosch" magneto. The crankshaft work in this make of cars is along lines far more secure than formerly did obtain in cars in general, due to the advances made in the art and the fact that the company is now in a position to command particularly good material, which, coupled with the Franklin process, aided by suitable dimensions, lends enormously to the stiffness of the product. To show something of the extent to which Franklin cars are looked after in point of detail, it is only necessary to say the valve springs are made of vanadium steel. The concentric valve motion has proven to be quite as competent as the designer predicted.

HAYNES: Haynes Auto Co., Kokomo, Ind.—Model X-4 is a 36-horsepower car, and it is a good representative of Haynes activities. Illustrative of the characteristics in

Elmore Model 33 Touring Car.



Haynes Model X, 36-Horsepower.

Franklin Model H, 43-Horsepower.

Franklin Model G, 18-Horsepower.

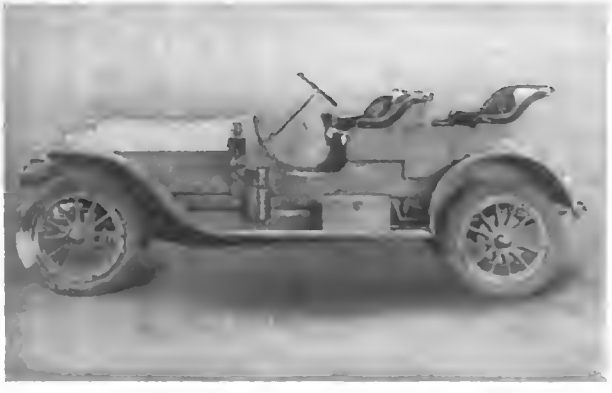
the products of this make is the crankshaft, the ends of which are carried on double sets of conical roller bearings, thus allowing for adjustment. The valves of the motor are located on one side, and all valves are of the same size, namely, 2 5-8 inches in diameter. In the wrist pins of the motor the bronze bushings are adjustable, and the general plan of the design takes into account the need for means by which adjustments can be readily made by one of no great skill. The clutch in the Haynes is of the contracting-band type, and in action is not unlike a conventional brake. The chassis frame is of more than the usual merit, owing to the use of a channel section reinforced by a special heat-treated vanadium steel member at the point of greatest strain. In the transmission gearset there is one principle that counts for safety and long life. This is by way of a ratchet drive on the master gear of the second shaft, so arranged as to prevent the operator from throwing the momentum of the car on the same in the act of starting or in the acceleration of the car. In divers ways the Haynes is a car of the most advanced construction.

KNOX: Knox Automobile Co., Springfield, Mass.—Model O is rated at 38-horsepower, and as a touring car sells at $3,000, which in all respects looks like a whole lot of car for the money. In this car it will be remembered that the cylinder heads are cast separate, and in this way it becomes possible to finish the cylinders with a precision difficult to duplicate. In several ways the idea indicates advancement over the former Knox models, and on the whole the cars of this make for 1909 should attract much attention. In the motor the valves are actuated by means of a single camshaft, and the valve motion is one of the advances of the year. This year the clutch is of the three-plate variety and is enclosed within the flywheel. In the sliding gear of the selective genera, two sliding trains are used, one of which affords direct on the high, then intermediate, and the second is for low speed and reverse. As respects materials used in this make of cars, they are well indicated in the use of chrome nickel steel in the gears.

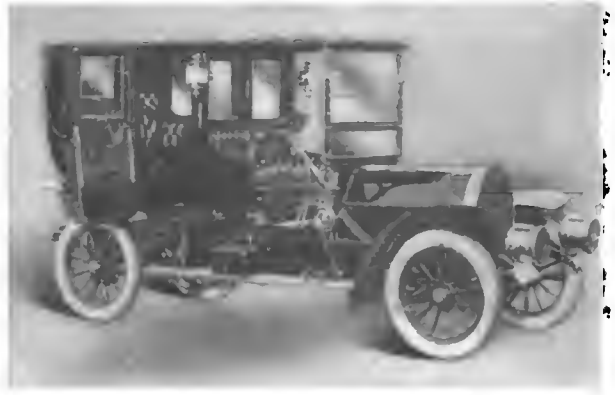
LOCOMOBILE: Locomobile Co. of America, Bridgeport, Conn.—The new shaft drive car of this company's make is the offering by way of the greatest advance in the line of cars the company produces. In this car the distance rods are situated as they are in the Locomobile side-chain drives and parallelism is thus main-

Locomobile Model 30 With Shaft Drive.

tained; these distance rods carry the brakes, and their rear ends are free to turn on the axle tube. The spring perches are also free to rotate within limits, and in these and several other ways flexibility is gained and road inequalities are not so prone to deteriorate the elements in the makeup of the car, which is a matter of the greatest importance, and, in fact, the great main reason why the shaft drive car was formerly regarded as more suitable for slow speed and low power. As it is, the 30-horsepower



Knox Model O With Small Tonneau.



Knox Limousine, 38-Horsepower.

Lozier Briarcliff, 45-Horsepower.

Lozier Little Six, 33-Horsepower.

shaft drive Locomobile represents a very modern and up-to-date shaft drive automobile.

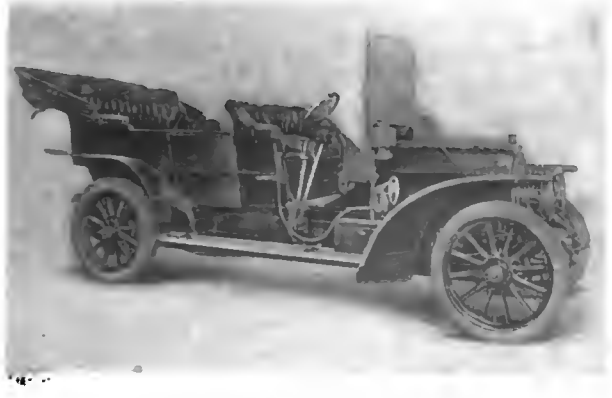
LOZIER: Lozier Motor Co., New York City.—Chain-driven cars will not be in the Lozier line during the year 1909, and by way of shaft-driven cars the Model H will be a good proposition to look at. Then, there is the Model I, which is a 50-horsepower four-cylinder car; nor should the "big six" be overlooked. In the Lozier line it is the claim that the gears and other important parts are

Packard Model 30 With Limousine Body.

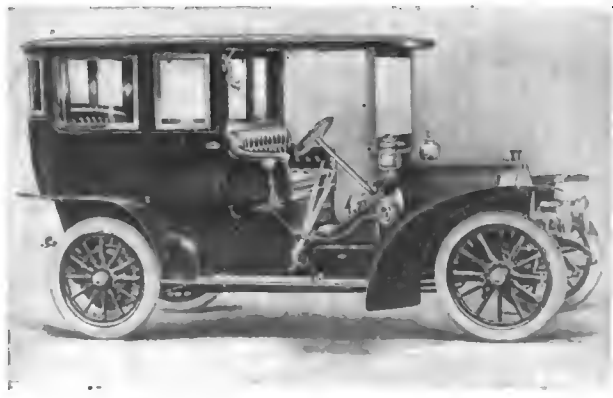
made of a fine line of alloy steel, and the cars are very simple in all respects, due in a large measure to the elimination of parts such as torsion rods, universal joints, etc. The front steering knuckles are now fitted with ball-bearings, and in this way the effort for steering is reduced to the nominal. The cylinders of the "six" are 4 5-8 by 5 1-2, and the rating is 51 horsepower, which is of course conservative. In body work the "Briarcliff" is with very low seats, and the effect is as handsome as the result is good. In endurance tests on many occasions the Lozier cars demonstrated their worth.

MATHESON: Matheson Motor Car Co., Wilkes-Barre, Pa.—Near "Giant's Despair," the hill that has proven the downfall of many a car of pretensions, the company naturally has the finest testing road in the country on which to try out the cars as they come from the works. Model E of the line is a 40-horsepower car, and in touring work it is regarded as quite up to a fitting standard. In this car the valves are in the head, all of the same size, and mechanically operated. The upper half of the crankcase is cast with a solid web between the supporting arms, thus lending adequate support to the motor; the lower half holds the oil used in the auxiliary splash, which does not prevent the "wick" system from working. The company lays stress on the fact that the gasoline in the tank is at no time under pressure; the arrangement is of such a character that the supply is regulated by the motor. When the motor stops, so does the gasoline. The car is fitted with hill-pawls and suitable means for controlling. As respects brakes, the cars are well provided; two of the brakes are constriction asbestos-lined bands on drums attached to the differential, and two are internal expanding on the rear road wheels, which brakes have shoes made of Parsons manganese bronze.

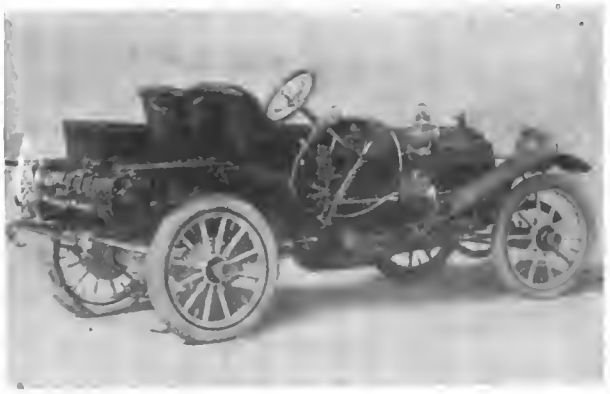
PACKARD: Packard Motor Car Co., Detroit.—The interesting car of the year from this well and favorably known plant is the four-cylinder 18-horsepower touring car. The price of this car is $3,200, and it is also used in connection with "town car" service. In general, the car is like the well-known "Thirty," but just enough smaller to make a desirable proposition in cases in which a big car may not quite suit the work. The chassis is standardized, and body work can be in many of the well-known designs. The mechanical features are of the most approved



Matheson Model E, 40-Horsepower.



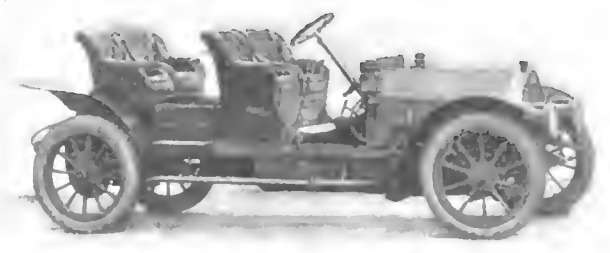
Matheson Model E With Limousine Body.



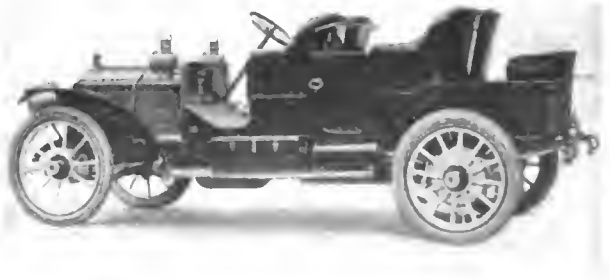
Packard Model 18 With Runabout Body.

"Packard" practices, among which may be mentioned the motor speed regulation, which is brought about by a governor in conjunction with the water circulation system. The speed changing gears and the bevel drive in conjunction with the differential are contained within a suitable aluminum housing, forming a rear axle unit. The gearset is of the "progressive" order, and the manner in which the changes are made is that usual to Packard practice. In connection with water pump there is a hydraulic pressure arrangement, by means of which the thrust bearing is lubricated, and in many ways the mechanical work is of an advanced order. In addition to the "Eighteen" there are the usual Packard choices besides.

PEERLESS: Peerless Motor Car Co., Cleveland, O.—Model 19 is a 30-horsepower car, with four cylinders, and, as the price indicates, it is a thoroughly up-to-date automobile, with every modern improvement of any value in this service. The car sells for $4,300, equipped for touring, and few indeed are the cars that have made a better showing of friends. In general, this car is not unlike the Peerless for last year, yet at the same time such refinements as the year afforded were incorporated into the model. In the refining process there is a point beyond which it is extremely difficult to go, and it would seem as if the Peerless has about arrived at that point in this car. By way of meeting the few differences to be considered, the wheelbase has been lengthened, and the weight distribution has been brought into a more harmonious relation. The shaft drive is on a basis to abort shock tendencies, and improvements in the universal joints have been effected. The new water pump on the motor is of the herring-bone type, and its noiseless performance is an added feature. The oiling system includes a compartment in the crankcase, the capacity of which is over a gallon of oil, and the means of distributing the oil are effective.



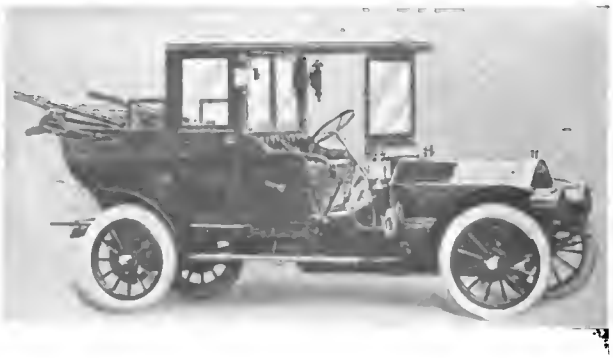
Pierce-Arrow 36-Horsepower Runabout.



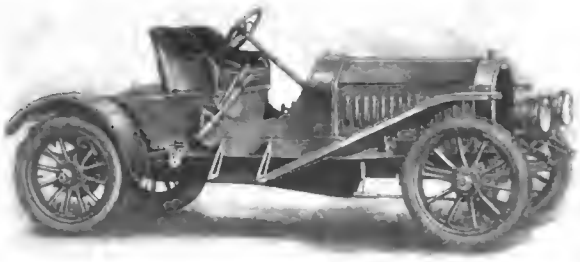
Packard 30 With Close Coupled Body.

PIERCE ARROW: Geo. N. Pierce Co., Buffalo, N. Y.—With one model of the four-cylinder type and three models using six-cylinder motors, the Pierce line for 1909 is well diversified. The four-cylinder car is rated at 24-horsepower, and sells at $3,500, while the bix six of the line is rated at 60 horsepower and sells at $6,000. In body work there is the usual diversion, and it is possible to get an "Arrow" in any of the usual selections of body work along lines consistent with the most modern practice, involving artistic work. In cylinder work the "twin" idea is used, and a bearing is used between each cylinder, which is a new idea in motor work; the castings are fashioned in a manner to suit the ends. The selective type of change speed gear is used, involving four speeds and direct on the high. The clutch is of the cone type in each case, and universal joints are used where they will do the most good. Engine valves are a little larger than formerly, and on the whole the models represent the refinements that the year fell heir to without a loss of former value. The Pierce line well deserves its great popularity.

POPE-HARTFORD: Pope Mfg. Car Co., Hartford, Conn.—Model S is a touring car made to sell at $2,750, and the aim is to eliminate every chance of considering a car at any price more of an automobile than the Pope-Hartford at the price named. To be able to make good, the company has gone over the whole proposition in the most careful and systematic manner, with the result that the units in the car were revised in such way as experience dictated, in view of previous practice. As a result, the clutch has a little wider face, the rear axle has been somewhat redesigned, the brakes have been increased in size, the chassis frame has been redesigned to include a better distribution of the load, and a goose-neck rear spring hanger is included. The new body, with its straight line effect, is well worth a trip to the Garden to have a look



Pierce-Arrow Six-Cylinder Landaulet.



Peerless Roadster, 30-Horsepower.

Peerless Limousine, 57-Horsepower.

at, and the wheelbase of 114 inches enables the designer to arrange the body to afford plenty of room.

POPE-TOLEDO: Pope Motor Car Co., Hartford, Conn.—For 1909 the company offers Model XXII, which is a 50-horsepower touring car of no mean proportions, the price of which is $4,500, and in view of the manner in which the details were brought up to date it will not be too much to say that the interest the patrons pay the product will be extended throughout the year, much to the advantage of the company and the patrons as well. In the motor as used in this car the valves are in the head, and each set is controlled by one double-acting walking-beam. The crankshaft runs on ball bearings of a large size, and in this respect the Pope-Toledo is looked upon as distinctive, not only because of the use of ball bearings, but for the reason that the application is along lines indicating good sense and an assurance of the fact that a famine of oil will not result in a crop of melted-out bearings. This is no license to go without oil, but is a fact that oiling systems can go wrong, for a time at least. The double U chassis frame of chrome nickel steel is a feature of this car which is attracting a good deal of notice, and for rigidity it is looked upon as all to be desired. In divers ways the car is a fine representative of 1909 work in the automobile zone of activity, and reflects credit upon its producers.

PALMER-SINGER: Palmer & Singer Mfg. Co., New York City.—The "6-60" of this line is one of the cars of the year, in relation to which there is quite some room for discussion involving late advances. On the other hand, the "4-40," known as the "Skimabout," is in brisk demand, and the spectators at the show are certain to regard it as a good sight. This car is fitted with a four-speed selective transmission and a multiple disc clutch. A "hill-pawl" is fitted to the driving shaft, and in divers ways the car is a most up-to-date proposition. In this car it will be remembered that the power plant is upon a sub-frame, and the accessories to the same are in positions to be reached at will without any trouble at all. The chassis frame is trussed through the waist; strength is thus added to an enormous degree, to the side members.

SIMPLEX: Simplex Automobile Co., New York City.—Rated at 53-horsepower, the Simplex four-cylinder model as it is shown at the Garden is a continuation of the last year's proposition, with such additions and improvements as the year's experience has influenced. Simplex cars were brought out originally to compete with the better grade of foreign automobiles, and imported materials abound in them. The wheelbase of the car is 129 inches, and the body work is always on a high plane. The details that were refined in the more recent of the models, which details are represented in the 1909 cars, include the elevation of the magneto, thus rendering it a little more easy to get at. Bosch high-tension jump spark magneto service is available in conjunction with a coil, thus affording the reliability to be expected in a car at a cost of $5,750.

SELDEN: Selden Motor Vehicle Co., Rochester, N. Y.—One of the first of the full-fledged automobiles to come out with a low-price tag, and now in its second year, with a fine record of noiseless performance, the Selden "29," is to be at the show, there to add to its host of staunch friends. The Selden is a four-cylinder touring car along lines consistent with absolutely standard practice, with no sign of untried innovations of any kind. The motor is conservatively rated, with the accessories in a convenient place, and among other things of more than the usual note is the I-section front axle of one piece in a drop forging. As a matter of fact, every

Pope-Toledo Model XXII, 50-Horsepower.

Royal Tourist Model X, 42-Horsepower.

part in the car that can be a die forging is so made, so that weight is low for the power, and the speed or hill-climbing ability is there. The touring body is of the straight-line effect, and at the option of the purchaser a roadster body will be furnished. Magneto ignition is an extra, but all provision is made, so that the cost of the addition is moderate, and the time required to fit the magneto is but short; it can be added at any time.

ROYAL TOURIST: Royal Motor Car Co., Cleveland, O.—A four-cylinder car, in which a 48-horsepower motor has demonstrated its ability to cope with the situation in a manner as befits the occasion is the car known as Model M, and it sells for $4,500. The motor has cylinders, with a bore of 5 1-2 inches, thus showing that the motor is well up to its rating. The water-cooling system is of the usual Royal design, and the car is provided with a four-speed selective change speed gear that goes for good performance. In other respects the Royal is on a good basis, as, for illustration, the wheelbase is lengthened, the brakes are in good presence, and a self-starting device will be furnished as an extra. In addition to this car, the Royal offers the usual number of models, and much interest is certain to be taken in what is an assured good display.

STUDEBAKER: Studebaker Automobile Co., South Bend, Ind.—On the Studebaker for 1909 the ignition will be featured. This consists of the make-and-break system, which has been used for four years with a low-tension magneto as a source of current, but with the new Bosch magneto plug. This simplifies the wiring to such an extent that there is but one wire from the magneto to the bus-bar and four short wires with vulcanite grips which are pressed on the stems of the igniters. Model D, a four-cylinder 40-horsepower touring car, listing at $4,000, will be the principal car shown, this being fitted with all of the various bodies now extant and some original creations by this company. This car has a four-speed change-gear mechanism, with direct drive on the third speed. The case is a three-part one, bolted to a sub-frame, the countershaft being above the mainshaft. Ball bearings are used freely throughout the car, with the exception of the crankshaft bearings, which are plain, of Parsons white bronze. The workmanship on these cars is of a superior grade as befits a superior machine. In the line of materials, too, a very high grade of materials is used, although the company says nothing about this, believing that these are more in the nature of a necessity on a superfine car than of a luxury. The specifications show that all up-to-date refinements in design and construction have been incorporated in these cars.

STEVENS-DURYEA: Stevens-Duryea Co., Chicopee Falls, Mass.—These very prominent advocates of the three-point suspension, coupled with the unit power plant and the forward location of the flywheel, will retain for the coming season all of these features. The disc clutch used on this car has one salient feature that attention will be called to, and that is the clutch will let go instantly, with no tendency to stick. This is due to the use of polished steel against leather on adjacent faces and is not always true of either cone clutches or metal to metal discs. The new Model X 24-horsepower car will be shown for the first time. This represents the desire of the company to cater to that class of ardent admirers who wish a car, but cannot afford a "six." It presents all the latest practice in design and materials, and, aside from the use of a four-cylinder motor, is a smaller-sized duplicate of the little "six." One new point that will be featured is an automatic position finder for the change speed lever, which insures accurate and instant gear changing. Using this it is unnecessary to look down or feel the way, for the gear

lever will stop automatically. By the use of the flywheel in front the clearance is so influenced as to depend only upon the rear axle casing, the height of this above the ground on Model X being 10 inches. This means that the flywheel cannot be injured on high crossings and similar spots in the road.

STEARNS: F. B. Stearns Company, Cleveland, O.—Characterized by the "white line around the radiator" feature of the older models, the baby Stearns makes its initial appearance at the Garden show. This is of 15-30 horsepower, with cylinders *en bloc*, following the latest small car practice, all other features following along the lines of the larger models previously built. These lines as relating to materials and workmanship are drawn very closely so as to include nothing but the best. The larger model is of 30-60 horsepower, the hyphenated rating in both cases being due to the use of a double-nozzle carbureter, an exclusive Stearns feature. The little car, it must be said, is of the more general shaft-drive type, while in higher powers the double side chains are retained, the sprockets and chains being of a special design which reduces the noise to a minimum. The crankshaft on all models is provided with annular type ball bearings. An innovation for this firm is seen in the incorporation of the transmission with the rear axle and differential housing. This is made of aluminum, which is not trusted to stand the severe road strains, however, a machined loop of forged steel which surrounds it forming the weight-carrying member of the rear axle.

THOMAS: E. R. Thomas Motor Co., Buffalo, N. Y.—The builders of the New York-Paris race winner have dropped for the coming year the old idea of being manufacturers of big cars only, and while the large models will be continued, their leader for the coming year will be a moderate-powered medium-priced car rated at 40 horsepower. This will be augmented by the continuation of the town car with a variety of bodies, this being rated at 16 horsepower. The medium-priced car, for $3,000 is a medium price for a good car, has a six-cylinder motor, with the cylinders cast *en bloc*—that is, in blocks of three, two of these being used. The crankcase, following a well-defined modern tendency, is cast in one piece, the shaft being inserted from the ends. This is of alloy steel, carried on three annular ball bearings, the use of these being a continuation of the practice inaugurated with the "16" town car, which has an exceedingly short stiff shaft or two ball bearings. The "4-60" at $4,500 is a continuation of the model which was so successful in the race around the world, the principal changes from last year, aside from the boring out of the cylinders to 5 3-4 inches, being but minor details making for refinement. The big "six," rated at 70 horsepower and capable of doing much better, is essentially a large car for heavy loads over all sorts of hard touring conditions. This car lists at $6,000 in a multiplicity of bodies, including all the standard types.

WALTER: Walter Motor Car Co., Trenton, N. J.—This is essentially an exclusive car for exclusive people, the factory output being a small, "personally conducted" one. Yet the price of the product is not exclusive, but is set at a very reasonable figure, considering the exceeding painstaking attention to details and the excellent grade of material used. The motor, a four-cylinder 48-horsepower unit, is hung in the frame at three points, this being one of the 1909 improvements—viz., the three-point suspension. Others are an increase in the diameter of the steering wheel by two inches, the substitution of platform springs at the rear in place of the semi-elliptics previously used, and the attachment of a ratchet stop to prevent the car

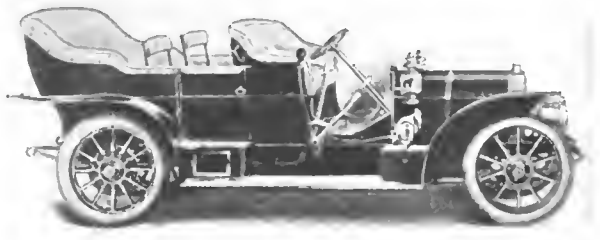
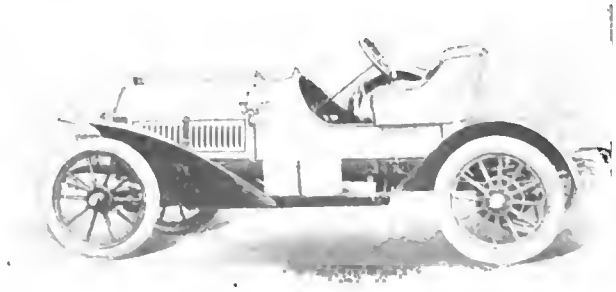
Stearns Landaulet, 32-Horsepower.

from backing down hill. The use of platform springs is but another outcropping of the three-point suspension, which this company is firm believers in. At the price asked, $5,000, this car represents an unusual value for the money, and their location close to New York City should give them an excellent outlet for the superfine product.

WALTHAM: Waltham Mfg. Co., Waltham, Mass.— Among the lifelong advocates of the air-cooled motor this company stands out clearly and distinctly. Featured among

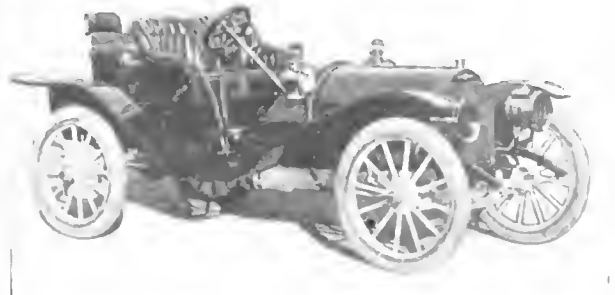


Thomas Flyer 4-60-Horsepower Touring Car.



Thomas Six-Cylinder 40-Horsepower Runabout.

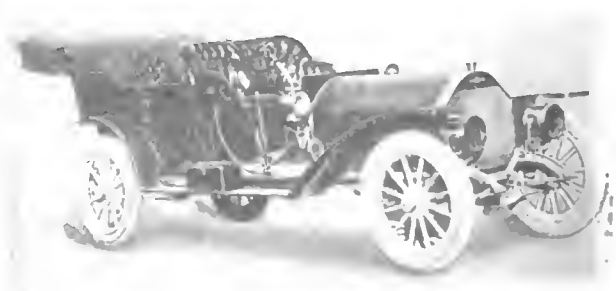
the larger and more commodious cars will be the little buckboard, with single-cylinder motor, 3 1-4 inches in diameter by 4 1-4 inches stroke, air cooled, and mounted over the rear axle. This drives the car through the medium of a friction transmission, which consists of a 15-inch friction wheel mounted on a countershaft, upon which it slides across the face of the driving disc for speed variations. From the countershaft to the wheels the drive is by double nickel steel chains. These cars are equipped with a variety of different carrying spaces, which suit well



Stevens-Duryea Model XXX Runabout.

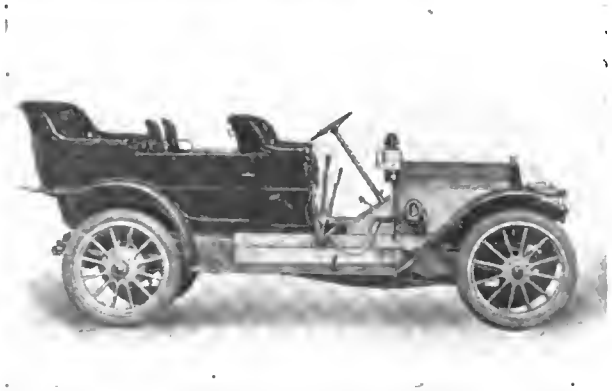
a multitude of light delivery systems. Coupled with the very low price of $350, this should have a very wide sale in the particular field to which it is adapted.

WHITE: The White Company, Cleveland, O.— Passing through the Garden it will take little time to ferret out the "steamer" of the show; there is but one. The one steam car will be found to make up in quality and the wide range of the uses to which it is put for lack of numbers, and the patrons of the industry evidently regard it as the *ulta mathule* of steam engineering, coupled with a display of automobile fineness that is not exceeded. Any description of steam cars, then, will reduce to a concrete statement of fact matching up perfectly with the "White Steamer." For the year the company will be content to supply two cars, the larger of which is known as Model M, and the other is known as Model O. The illustrations of the White car will clearly depict the character of the body work. The White engine as it is used in the 1909 cars is far and away superior in point of merit from anything



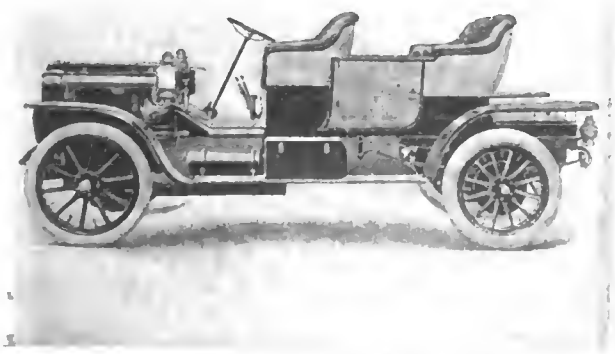
Stevens-Duryea Large Six 54-Horsepower.

Studebaker Suburban, 30-Horsepower.

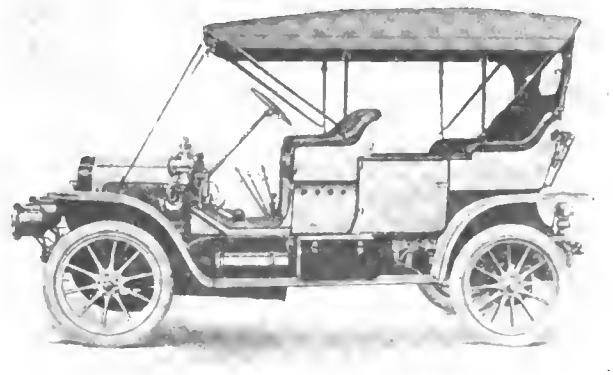


Studebaker Model D, 40-Horsepower.

previously turned out for the purpose. In the earlier products, using the Stephenson valve motion, which was actuated by eccentrics on the crankshaft, there was recognized chances for improvement, for reasons that were as common knowledge for years before the advent of the automobile. In the new White cars the "joy" valve motion is used, and the results are so far ahead of the Stephenson performance, and in so many directions, as to leave no ground for comparison. The joy valve motion is

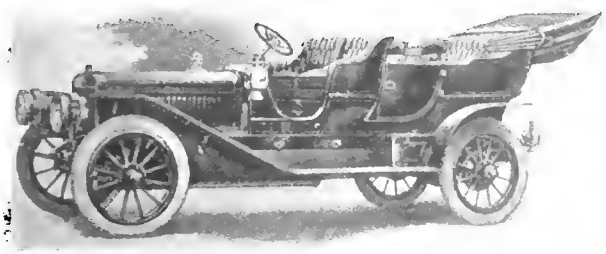


White Steamer Runabout, 40-Horsepower, Model M.



White Steamer Model O, 20-Horsepower.

more compact, which would be as a small detail were it not for the gains by way of flexibility, and in the steam consumption per horsepower hour. The joy valve motion is actuated directly from the connecting rod, and, aside from the good that comes from the same, there is also the fact that the crankshaft is simplified, of tool steel, and ball bearings are used, of the annular type, using the crankshaft itself as the inner raceway; for which purpose the crankshaft is suitably fashioned, the materials being of the right grade for the purpose. In a hundred ways the cars

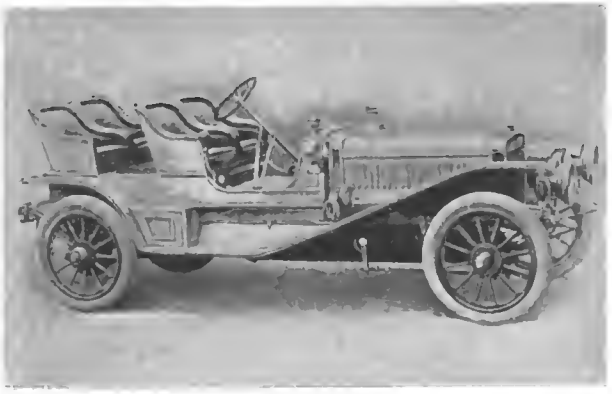


Winton Six Touring Car, 60-Horsepower.

is advanced along lines consistent with the highest possible development of the automobile and the steam power plan as used in the White.

Take, for illustration, the water in the generator; it is not allowed to merely segregate at its own sweet will, depending merely upon a difference in weight as between hot and cold water. As the diagram of the generator will adequately show, the water (or the resultant steam), in order to pass from one coil to the next below, must traverse upwards to a level above the topmost coil, thence to the new level. It will be proper to say that the two models are alike in all particulars, as respects the power plant, excepting that one is of greater power than the other. In body work there are several options, as the custom in general.

WINTON: Winton Motor Carriage Co., Cleveland.—This is the low upkeep six-cylinder car. The makers say that the former is an inherent attribute of the latter, and as a consequence they will produce nothing but



Winton Six Runabout, 48-Horsepower.

six-cylinder cars the coming year. This policy as pursued the past year must have been a successful one, else it would not be continued. Two "sixes" will be produced, each with a host of different bodies to choose from, the principal differences; in fact, the only differences being in the matter of sizes. The smaller, with a six-cylinder 4 1-2 by 5 motor, is rated at 48 horsepower, while the 5 by 5 is called a "Sixty." Both of these will be equipped with the self-starter, which has been so successful in the season just closed. This, as is well known, is an air-pressure device, the air under pressure being compressed mixture taken off from cylinders one and six. This is stored in a pressure tank and is supplied to the motor by means of a special starting cock, which when opened allows the fluid under pressure to pass through a distributer to the proper cylinder. The carbureter will be continued from last year. This is of the two-nozzle type, with a throttle for each nozzle, these operating progressively. The multiple disc-clutch is also retained. This consists of 67 very small diameter discs, the size being kept down to reduce the inertia effect, while the loss in surface is compensated for by using a larger number of discs.

WHAT PATRONS FIRST SEE IN THE CARS.

In view of the fact that it is not so easy to "spin" a motor, it is a moral certainty that the average purchaser will think of the means by which motors may be started with ease. If a car is large, and if the motor is also of much power, then it is a good thing to think about, and purchasers will find that makers, too, have thoughts along the same lines, some of which thoughts are expressed in a most substantial manner.

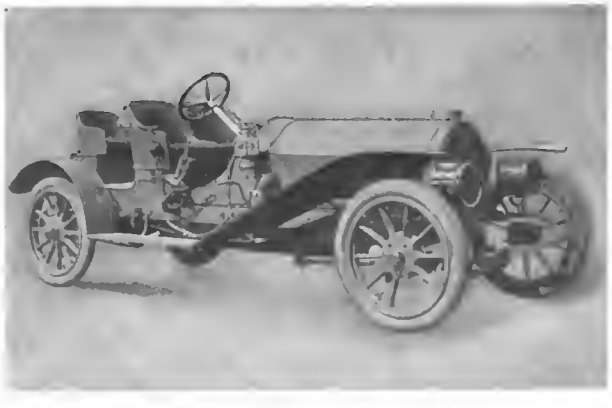
As a second consideration, purchasers are prone to think of the lubrication, since it is true that much trouble can be the result of inferior methods of landing the requisite amount of oil on the right spot at the propitious instant. The several available ideas are intended to do the work, each in its own way, all so effectively as to leave no question, and it is in such matters that the purchasers have the pleasure of picking the method that pleases them.

Ignition in a motor is about as essential as the motor, and in this respect the cars at the show allow of the widest latitude, since the purchasers will find all the good methods on the various cars, and they can take their choice. Magnetos are regarded as the most likely; transformers are used; they are of the "step-up" kind, and the Atwater-Kent idea is there. Then there is the magnetic plug, as put on the Studebaker cars, in which the Bosch magneto plug takes the place of other methods. Coils are used in all the different designs, among which the "master vibrator" makes for simplicity of the brand autoists will appreciate. Batteries are "storage" in many cases, if the magneto is not used as the main means; dry cells take the place of storage batteries if the battery is as an auxiliary. It is also a fact that in the Atwater-Kent plan the dry cells will do, since the system indicates economy in the use of current.

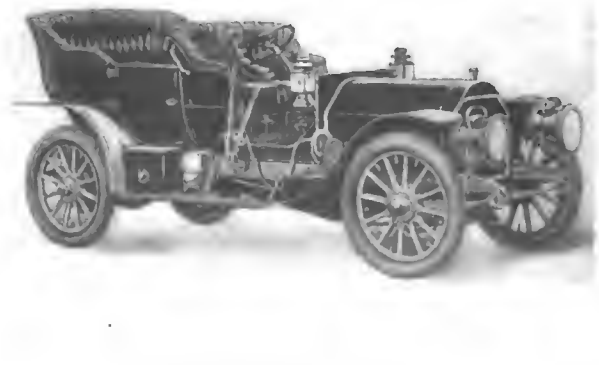
Lamps, lighting and the means embrace a subject which the average autoist allows to roam through his mind as a vagrant thought, sometimes until he has purchased a car. The plan is not one to be recommended as a rule, although it is a fact that the cars at the Garden are well fitted out with good lamps, with but few exceptions. This year there is a "black nickel finish" which should appeal to the average autoist. This finish is not so likely to tarnish, and it should be very permanent. It is a true nickel finish, and for that matter it is more permanent than bright nickel. Generators are in a fine state of development, most of them so nicely designed as not to "clog." They are of good capacity, do not use "carbide" on an extravagant basis, and the "flame" is steady, bright and in ample presence. Those who do not like generators can choose gas tanks; they are in the several desirable sizes, and they do the work in a manner to leave nothing to be desired. Of the piping there is little to be said unless it is to point out that it is up to a fair standard as a rule, and some of the companies take great pains to have the piping on a very certain basis.

Tops, windshields and fittings are for comfort. As a rule these items are as extras, and autoists will be at liberty to settle the questions for themselves in conjunction with the cars they may select. Tops are in far more substantial presence than formerly and windshields are of the kind which serve the purpose in a manner quite in keeping with the needs. The designs are of the "adjustable" genera, while the location and the slant are such as to keep the glass clear. This is a very important detail and the windshields at the show are in full accord with the latest ideas along these lines.

In equipment by way of extra tires the spare-wheel idea is uppermost, and the manner in which it is carried out by the various companies is in keeping with the rest of the automobile. There is one point, however, which does not seem to take root with that vividness which characterizes the situation in general. It is an assured fact that tires if they are kept free from wounds will last far longer than is the case under ordinary conditions. It would seem, then, as if autoists would take to the idea of vulcanizers and regard them as a regular part of the car equipment. There is no denying the fact that this and other details should reduce the cost of upkeep of cars to a marvelous extent, and it is believed that it is right to consider the several phases of the question.



Palmer-Singer Six-Cylinder Runabout.



Stearns 30-60 Standard Touring Car.

GROWING POPULARITY OF ELECTRIC VEHICLES

ACTIVITY seems to center around the battery to a considerable extent, although it is true as well that the uses to which the electrics are put is gradually extending. In the first place it will be understood that there never was any question of the splendid value of electric methods of goods transportation involving "short hauls." The long haul, on the other hand, is a matter depending upon the competence of the battery, as respects the radius of action, on a single charge. Even this is a matter that daily is becoming of diminished importance because it is a fact that the number of "charging stations" is multiplying, and as charging becomes more easy to manage the radius of travel on a single charge becomes a matter of less importance.

Town cars, taxicabs, runabouts and surrey types are increasing rapidly, and there are many indications of advances in other directions.

The question of tires was ever a matter of the greatest importance in connection with electric vehicles, owing to the weight, which on account of the battery makes for more than is customary in conjunction with gasoline cars. Knowledge of the true capabilities of tires has enabled the makers to meet the situation, until now the tire situation is much improved, as would be the natural expectation. All along the line it is to be noted that the wide use of electrics for many purposes is extending beyond the limits once predicted by the most optimistic.

Having thus generalized in relation to elcctric vehicles, it will still be possible to detail out important features and after a fashion show something of the progress made.

In the early days motors were wont to give more or less trouble, for the reason that, if they were not enclosed, they would be damaged by dampness, dirt, and mechanically. On thc other hand, to enclose them was to have them burn out, since it was not then known how to afford the means for the escape of the heat, which is ever present and which must be tapped away. In the motors as they are to be found at the show this phase of the question will be found in shape, indicating that the designers of the motors had at hand all the latest information of an authentic nature bearing upon the subject, and they used it—at whatever cost.

The "drum" controller is used to the exclusion of the other forms in about every case, just as in railway work, in which this type of controller has well served the exacting purpose for a number of years. There are deviations in point of detail, to be sure, and of them knowledge will best emanate through the good office of the literature to be had from the respective companies.

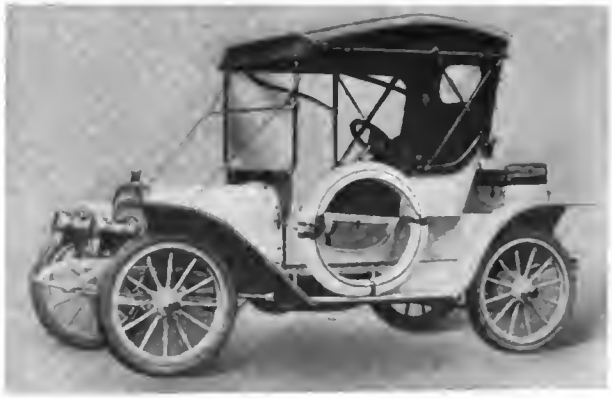
Few indeed are the autoists having had to do with the "electric" who will not fully understand the importance of wiring in a manner to protect the wiring from the fumes of the acid which rise like a "fog" from the battery during the charging process, or if the battery is in a condition of "mud," even during a hcavy discharge. They will be glad to know that the question has been adequately cared for in a manner to leave no doubt of the result. Then the losses in the wiring have been reduced in that the sizes of the wire used are of greater section, and the joints havc eithcr been eliminated, or they come in places of the least damage; moreover, they are soldered.

There are divers ways of effecting speed changes in electrics. In some cases the motors and the battery, the latter in sections, are worked in series parallel, and all changes are made without inserting resistance. In other cases the battery is in series, and the motors work in parallel or in series. Then, there are the cases in which a resistance is inserted under certain conditions. As a rule, it is not desirable to employ a resistance in the circuit, since it is not economical in the main. On the other hand, there are conditions which warrant the use of the resistance, and in such cases it will be found.

The question of the number of battery cells to use is one depending upon the type of car, the mechanical efficiency of the same, and the size of the motor, which in turn takes into account the speed of the vehicle as well as the roads. For the little runabout types of cars it is customary to use as few cells as possible, and ofttimes as few as 11 cells are used. But if the cars are larger it is then customary to use 22 cells instead of 11, but in the standard examples of vehicles 44 cells of battery are used. As to the number of plates per cell, this is a question which takes into accourit the load on the batteries, the radius of travel and such matters. The present practice is to employ an adequate battery, and to select the types of battery best suited to the work. In special cases it is the custom to select "thin plate" batteries, in which the amperc rate is high, and in which weight efficiency is of greater importance than long life. Makers of cars do not recommend short life batteries, excepting under certain conditions, and as a rule the heavier (low rate) batteries are used for the purpose. Of course, if a vehicle must make long distances on a single charge, it at once becomes necessary to use the light plate with the high rate and the shorter life. On the whole, it is up to users to be sensible about this matter and select the best all-around battery for the purpose. They are all to be had in the electric vehicles at the Garden.

ANDERSON: Anderson Carriage Co., Detroit, Mich.—Of the products of the Anderson plant special mention will be made of the runabout type of electric, which is a car of high development, and time has been spent to bring it up to a fitting standard. There is a wide range of uses for the moderate weight electrics that will not lay down, even if the distance traveled on a single charge of the battery be very great. With a well-designed chassis and bearings of the anti-friction type in every place in which much power could be wasted, it is then but a question of battery and a motor equipment of the class which will show a high efficiency, both in point of weight and for power. The Anderson electrics are designed with an eye to the main chance.

BABCOCK: Babcock Electric Carriage Co., Buffalo, N. Y.—"If you are going to imitate the gasoline car, why not go the whole thing and make a complete job of it." So says the Babcock Company, and in the 1909 Babcock electrics the company has made good. The new Babcock electric town car, also used as a taxicab, is in line with the idea as above expressed, and it is generally conceded that the car is of the greatest utility and "dressy." Then, there is the "gentlcman's roadster" of the Babcock series. In this car will be found

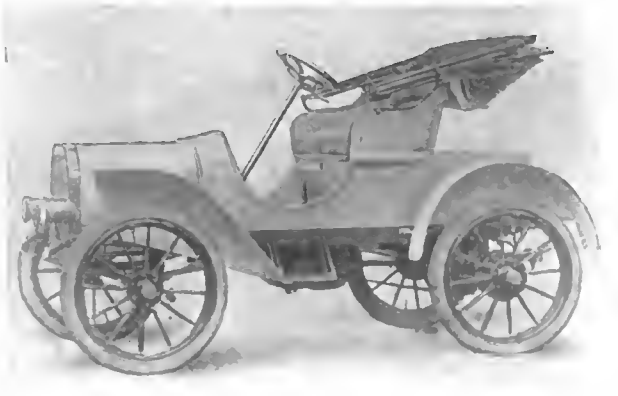


Babcock Resembling Typical Runabout.

all the requisites for an enjoyable "spin" on the boulevard, with never a fear of extending the trip beyond the safe radius of travel of the battery. The car looks fine, the road performance is notable, and the cost of maintenance is very low indeed. In this connection it may not be out of place to point out that the Babcock is so simple as not to be a problem to a boy, let alone a man. The control is worked out in a manner to assure the best results, and any semblance of complication is lacking in presence.

BAILEY: S. R. Bailey Co., Amesbury, Mass.—This company will be found at the exhibition in the Garden with its usual fine display of electric vehicles, and it is assured that the cars will create the widest interest. The line turned out by Bailey includes everything of value along lines consistent with the best practices of the day in the light of the most advanced advices from authoritative sources.

BAKER: Baker Motor Vehicle Co., Cleveland, O.—When the Baker electric was first presented to the market it was regarded in the light of a new departure, for the reason that instead of using 40 to 44 cells of battery but 11 cells were used, and the result was most gratifying. To digress a pace, it may be well to say that the Baker "Torpedo" raced on Staten Island in the early part of 1903, making the enormous speed of 80 miles per hour, although the misfortune of the occasion was by way of the car leaving the road. From that day to this there have been Baker "stunts," and the growth of the company has been rapid until to-day the Baker is a great industry. The Baker plant at Cleveland, in the vicinity of Edgewater Park, is a model to go by, both in point of hygienic arrangements and in the accuracy of the work turned out. Baker electrics show the result of an up-to-date plant in which the artisans are afforded adequate light, good ventilation and an even temperature. The Baker electrics at the show will be a feature well worth viewing, and it will compensate visitors interested in this class of vehicles if they pause a moment. The little "piano box" Baker is one of the sights of New York City on any fine day, driven as it is more often than not by ladies.



One of Baker Family of Runabouts.

COLUMBIA: Electric Vehicle Co., Hartford, Conn.—One of the oldest builders of electrics, and with a wide range of sizes and types of electric vehicles, this company always creates much interest on show occasions. The yellow surrey of the Columbia series is probably one of

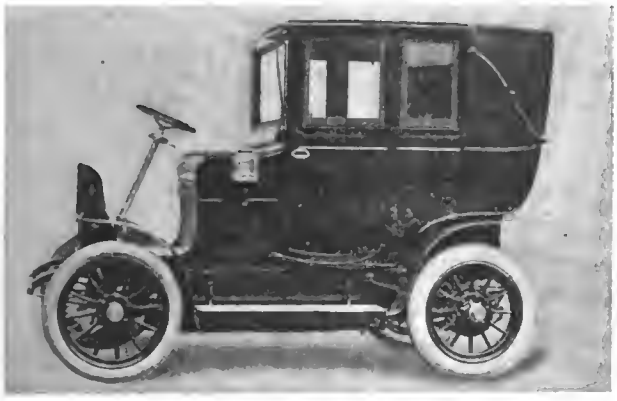
Fine Lines Evident in Babcock Brougham.

the cars of the genus which has gained more by way of popularity for electric vehicles than any other one car out of the well-equipped plant of the Columbia company. Many of the surrey type are to be seen in the congested centers, in mixed service, and the electric equipment is so very reliable as to be especially commendable. A description of all the types of Columbia would fill a book, but to dismiss the subject without mentioning the town car would be to fail to take note of luxury on wheels, the scope of which has never been exceeded.

Lightweight Enclosed Baker.

RAUCH & LANG: Rauch & Lang Carriage Co., Cleveland, O.—Along standard lines this company turns out a line of electrics which for style and finish are most appropriate. The coupé is a car of interest for many purposes, and is much in demand for doctors as well as for the family. Then there is the runabout and the Stanhope types to look at, as well as the special body work for any fitting purpose. The electric work on the cars of this line is of such a high character as to command the attention of the trade, while the harmony of the battery as it relates to the work is such as to assure a wide radius of travel on a single charge.

STUDEBAKER: Studebaker Automobile Co., South Bend, Ind.—The Model 13-A of the Studebaker is of the Stanhope type, and a car to be examined because of its lines and the general good that will be found in it. The speed of the Stanhope is better than 18 miles per hour, and the radius of travel is exceeding. The car weighs some 2,300 pounds, the tires are 30 x 4-inch (pneumatic) front and rear. The wheelbase is 73 inches. The coupé of the Studebaker line is another car that should be as popular as would seem to be the case. In this car the speed is 13 miles per hour, which is right for town



Columbia Will Continue Mark LXVIII.

service, and the range of travel is that due to the use of 24 cells of 11 plate battery. The wheelbase of the car is 67 inches, and 30 x 3-inch (pneumatic) tires are used in front, while the rear tire equipment is 30 x 3 1-2 inches. There is one other point in relation to the coupé that is worthy of notice; the top is removable and a regular

Studebaker-Stanhope Has Lever Steer.

victoria or a gypsy quarter top can be substituted. The workmanship is up to the usual Studebaker standard.

WAVERLEY ELECTRIC: The Waverley Company, Indianapolis, Ind.—Among the interesting features of the display of electrics that by the Waverley Company will deserve something more than the passing attention of visitors. Four types of carriages are to be shown, two of the models that have not been seen before in any automobile exhibition. The distinguishing mark of the new Waverley is the patented drop sill, a feature which, by lowering the seat and floor of the car, adds greatly to its convenience in use and accounts for the peculiar compactness of build and trimness of design that mark the Waverley. The use of removable coupé tops, permitting an all-the-year-round service with a single car, is another point on which the Waverley people wax eloquent.

First Product of New Waverley Company.

A unique feature of the exhibit will be the special display of the new rear system of noiseless double reduction driving mechanism which distinguishes the latest type of Waverleys. This mechanism is attached to the body and its weight is therefore cushioned by the springs instead of falling directly upon the pneumatic tires. So effective is this cushioning of the principal weights that solid tires may be used with comfort. One of the latest models, No. 74, will be shown equipped in this way. A further advantage claimed for the driving gear is its noiselessness. This is due to a new system of lubrication that keeps the principal bearings in a constant oil bath and to the use of the herringbone type of gear already well known to Waverley users. Another mechanical feature about which the Indianapolis people are quite enthusiastic is the new controller that goes with this year's models. "The position of the reverse lever in the seat immediately back of the speed lever is a special convnience; the automatic locking device prevents accident, and the controller is practically trouble-proof if not fool-proof," said one Waverley enthusiast—but we will not spoil the story for our readers. They should get it from original sources at the show.

WOODS: Woods Motor Vehicle Co., Chicago.—A wide range of electric vehicles and one of the pioneers in this phase of the industry. It was in a Woods that some of the members of the Society of Automobile Engineers, while at the Summer meeting, held at Detroit last year, trailed along after a long string of gasolines, mile after mile, all day, and made every engagement on time. The coupé of the Woods line is a very desirable doctor's rig, protecting the occupant from the weather, and the control is all inside, including well-devised "magnetic" brakes as well as the usual set. For radius of action and low cost of upkeep the Woods vehicles have a very consistent record.

Woods Line Includes Popular Coupé.

FEASIBILITY OF MOTORCYCLE DEMONSTRATED

MAKERS are preparing for a brisk trade in this line, and as a prominent one put it: "There is no doubt that the motorcycle is coming rapidly to the fore." Indications are that the days of the cheap imitation of the motorcycle are inclining to oblivion; due in no small measure to the fact that the patrons of the motorcycle trade are wont to eliminate the troubles that such machines are naturally heir to. To again quote the same maker: "The only thing to be feared is the flooding of the trade with cheap motorcycles, the quality of which is cheaper than the price. A motorcycle that is poorly constructed is really more expensive than the average mind conceives." While it is true that such methods are much to be feared, the fact remains that the "cyclists" are not now likely to support such a venture to any great extent. At all events, it would seem from the motorcycles on exhibition this year that the old line of strictures are "stale." The motorcycles to be seen certainly do look to be in full accord with the spirit of the age, a spirit which indicates a desire to pay the price but to insist upon the fullest measure of quality. How any adventurer can swim against the strong tide set up in this direction is a question which will have to be answered in the light of further experience.

This is the year of the greatest advances, and while it it not new to see motorcycles with four cylinders, it is a fact that there were none "on show" formerly as they will be at the Garden. Then there is the question of the shaft drive; cyclists are now in a position to look them over (with the shaft drive) and judge for themselves the extent to which they will care to indulge. The motors with two and single-cylinder power plants are in the greatest profusion, and chain and belt drives look more practical than ever before. The frames are of the "diamond" and "loop" designs so well distributed as to render any attempt at fixing upon the trend quite out of the question. As respects the materials, it is to note the profuse use of alloy steel tubing, and an increase in the use of the large sizes of the same. There is evidence of the effect of the automobile in the motorcycle, in that there is a type of motorcycle in which a crank is used in starting, and in this case no pedals are used. Magnetos are included in the finest examples in the ignition systems, and in divers ways the accessories are on a basis no less permeated with utility than is the case in the automobile. The difficult problems were solved in a manner which indicates a fine display of ingenuity on the part of the designers of motorcycles, and the price is as low as can be expected, quality considered.

In the past some of the failures, of which there have been a surprisingly small number, were directly due to the desire of the users to improve upon the machines. The desire seems to be an American habit, and it is admitted that Americans have succeeded in improving upon about everything under the sun. The fact remains that it is at the expense of the machine, in any given case, that tinkering is done. When a motorcycle is finished it pays to let it alone, and when the desire comes on, then it is good time to tinker with something that is not in a state of completion. This year the incentive for changes will be at a low ebb, and this may be the solution of the problem. In other words, the motorcycles of the year are in a state of very satisfactory completeness.

NEW ERA: New Era Gas Engine Co., Dayton, O.—Of the motorcycles that will be seen at the Garden the New Era will attract a full share of attention. The product of this make shows the earmarks of that quality which comes from careful work in a shop noted for the quality of its work, and among the new features to be found on the New Era will be mentioned the absence of vibration, due to the 60-inch wheelbase and the right disposition of the weight, as well as the fact that the kinetic balance of the reciprocating parts is what is termed a satisfied couple. In the New Era there are no pedals, and a footboard is placed instead. Then the motor is started by a crank. The motor is "free" and two speeds are provided.

N. S. U.: N. S. U. Motorcycle Co., New York City.—The model De Luxe of the N. S. U. is rated at 6 horsepower, and is in every way a motorcycle to suit the buyer of more than the usual acumen. The details of design are modern and numerous of the features are novel. This type of the N. S. U. will attract the notice of cyclists at the show, and while the company has a wide range to select from, the fact remains that the De Luxe has the snap and the go so much to be desired. The company says, "N. S. U. means quality." The product seems to back up the statement.

PIERCE: The Pierce Cycle Co., Buffalo, N. Y.—That the motorcycle industry is limited in any way is far from a fact, as will be adequately illustrated by visiting the Pierce exhibit at the Garden. The Pierce four-cylinder model is something to look at; it is a shaft drive. The frame is with extra large tubing, and the four-cylinder motor has a magneto for the ignition and all the contrivances of a power plant of the first order. The Pierce is intended to be a permanent motorcycle to stand up against all possible road conditions and to be repaired with ease when after long service it becomes necessary to consider the matter of repairs. The appearance of the four-cylinder Pierce is graceful, and the obvious strength of the frame is in keeping with the undoubted power of the motor. Then, it is pleasing to note the shaft drive, under the circumstances, and to observe that all along the line the Pierce is quite up to the most fitting standard of excellence.

R-S: Reading Standard Co., Reading, Pa.—"Built and tested in the mountains." It is thus that the maker infers that his type of motorcycles can be taken seriously. That it is so taken is rendered apparent if only one will look about and note the many users who swear by the machines they use. For 1909 the company is showing models as follows, (a) loop frame; (b) diamond frame: (c) delivery van; (e) tandem, tricycle and chair models. The motors used in the R-S machines range from 3 to 7 1-2 horsepower, with single and twin cylinders, depending upon the power. The drive is with belt or chain, depending upon the demands of the patrons, and the ignition is with battery or magneto, as may be selected, the price changing accordingly. All loop frame models are fitted with 26 x 2 1-2-inch tires; all diamond frame models have 28-inch tires. In every case the accessories are most complete, and of a grade to leave nothing to be desired. The tire pump is large, and of good advantage.

THE PROGRESS OF THE COMMERCIAL VEHICLE

By MORRIS A. HALL.

AN industry that has progressed by leaps and bounds, with the prospect of future "leaps and bounds," is that of the power wagon. This has been held back, perhaps, by ignorance on the part of the employer of the time economy, which has been truly said to be money and which took the form of passive or stolid indifference. On the other hand, this same ignorance, present in the employee, took the form of opposition, strong and virile.

It is a fact that the latter are becoming more versed in the intricacies of the work vehicle as a result of the involuntary missionary work carried on by the pleasure car, which is working out in the form of a lessened opposition to the commercial end. This is manifested best by such little items as the readiness with which the cab drivers are taking up taxicabs. Similarly the farmers have gradually reversed their position, and many are to-day to be numbered among the advocates of commercial cars.

The employer, on the contrary, and with superior intelligence, has shown also superior stubbornness. A fact which has contributed somewhat to this is that the average, or, better, the great majority, of users of horses for trucking purposes do not keep any separate record of their trucking costs, so that they have absolutely no idea of the expense per ton per mile of moving their freight. Consequently, figures mean nothing to them, and it is impossible to show a direct money saving by the self-propelled vehicles.

This same lack of a record of horse performance also carries into the item of time. By this is meant that as no accurate record is kept of the time necessary to make a certain run with horses, it is not possible to make an intelligent comparison which would show the vast saving of time due to motor service.

Opposition Overcome as Supply Is Provided.

This is, however, being overcome in about the inverse speed of the industry to care for additional expansion, or, stated otherwise, the opposition is being overcome as fast as the commercial car manufacturers get into a position to turn out more cars and thus care for additional users. At present the production is small, but is growing each year. About every other week an addition to some vehicle plant is reported, and no less than once a month the announcement of some additional pleasure car manufacturer falling into line is made, the past month of December having produced two.

It is well known that the truck bearing any similarity whatever to the pleasure car, that is, in running gear (four wheels, the two fronts steering) and in power equipment, reaches its limit at about five tons. For loads above this, the power requirements are abnormal, the load and the power together require a different distribution, the limit for rubber tires is reached calling for something very different, etc.

Points Towards the Tractor.

All this points toward the tractor with a trailer or road train. In this much interest has been shown, and, although by far the greater portion of the work done along these lines has been done abroad, it will interest visitors to the Garden show to see one American example of a road train. This has a total capacity of 15 tons of live load, weighs about 12 tons, and is capable of a speed of six miles per hour. The vehicles are all of the six wheel type, the body being suspended upon four inverted leaf springs. The center wheels are the drivers, while the front and rear pairs steer. This multiple steering arrangement allows of the three vehicles, whose aggregate length is no less than 60 feet, turning in a 40-foot circle.

While the applications of vehicles of this capacity are necessarily limited, there is no doubt of the fact that in their own particular field they represent a vast advance over the previous arrangement which called for three or four trucks with as many drivers. In cases like mines segregated in a small place some distance from the railroad, a very promising field is opened up, but it is doubtful if they will find many opportunities in urban or suburban traffic.

Other independent commercial car problems include the six-wheeled truck, the lightweight low-priced delivery wagon, and the now omnipresent taxicab or town car. The first named has made little progress in the past year; in fact, it never has made any appreciable progress in this country. The delivery wagon, on the other hand, might be fairly taken as representative of the whole industry, such has been its progress. From the first delivery wagons, which were merely pleasure cars with a box or other commercial body, to the present form of car built expressly for and devoted entirely to the delivery service, has been a big step and one not unattended by danger to those who attempted to press the former type upon an unwilling public.

Delivery Wagons at Reasonable Prices.

To-day, however, we have upon the market at reasonable prices any number of delivery wagons, any one of which used with intelligence will give good results, so good, in fact, as to bring the vehicle into the "good investment" class.

The last named class is probably the largest, both in number of producers and numbers of cars produced. The peculiar nature of the vehicle, coming midway between the pleasure car and the work vehicle, perhaps accounts for this. In turn, this also accounts for the number of pleasure car builders, who have entered the commercial field with a car of this type. This was not a sharp breakaway from pleasure chassis practice, as a heavy truck would be, but was rather an easy forward step from a large to a small car with a dainty little enclosed body.

A noticeable tendency in the heavy truck class has been the loss of advocates for the five-ton truck in favor of the three-ton and lighter machine. Although gradual in its growth from inception up to date, this idea has, however, gained so much ground that no less than two of our principal builders devoting their attention exclusively to commercial cars have, to all intents and purposes, abandoned this size. The argument from the manufacturers' side is a matter of sales. He says, for every possible prospective purchaser of a five-ton machine, there are not less than half a dozen firms who can and will use one of three-ton capacity. The same line of argument may in turn be applied to the

three and two-ton machines respectively, by saying that for every buyer of the former there will be a dozen for the latter.

On the other hand, another of our commercial builders has recently brought forth a new five-ton machine. This maker, it might be added, does not list or build a three-ton chassis, so that it may readily be seen that he pins his faith to the reverse of the above proposition, or, put into other words, that there are more five-ton buyers than three.

Proportion of Motive Power to Load.

Coming down to the details, more attention is being paid to the proportion of the motive power to the load. The first machines showed a shameful lack of this, for they were mainly under or overpowered, the former being characteristic of the delivery wagons and lighter trucks, while the latter fault was found more often in the heavier machines. To-day this matter is more equally arranged, and the three or two-ton machines with 50 or 60-horsepower motors are few and far between.

So, too, in the matter of springing. The idea that the only necessity in truck springs was enough (and often too many) leaves to carry the load is fast passing, and many of the best trucks have springs of alloy steel correctly proportioned. This is a matter of dollars in the pocket of the owner of a truck, as the high grade steels of perhaps double price will last four or five times as long as the cheaper material with a multitude of leaves, meaning excess and useless weight.

Substantial Progress in Tires.

In the matter of tires, always a bugaboo to car owners, commercial or otherwise, substantial progress has been made due to the awakening of the rubber people to the fact that the service was radically different from that of touring cars and demanded different treatment. Aside from the improvements in existing types, many new types were brought out and many more are in prospect, to judge by the large number of patents granted in this line. Wood and sectional rubber have made gains that are noteworthy, while many anti-skidding devices have been brought out and tested, among which might be mentioned the Hartridge sectional tire, an English product.

For motor 'bus use the combination or gasoline-electric type of drive has gained many adherents, although for pleasure use the reverse statement would be more true.

Coming to the electric, this is found to have been more closely confined to its class, viz., the short haul proposition, although many new users in this field do not so classify. Upon inspection the latter will be found grouped in a class of their own, having adopted this power because of the fact that they were engaged in electrical work or otherwise has electric power of "juice" in their plant in excess quantities, so that the item of charging the batteries assumed less importance.

Steam has in the past year won many friends in the commercial industry, although in fairness it must be said that these have been confined mostly to fire, police, hospital and similar service, where the standard chassis could be used with a special body.

Range of Use Extending.

The wide range of users has now become wider than ever before, as was natural with a natural and healthy growth, but the greatest spread has been in or rather for fire service. This branch in which the self-propelled car advantage of speed is most advantageous has made the greatest strides forward, many of our cities after extended tests having discarded horses entirely. This has been due mostly to inherent superior ability on the part of the self-propelled apparatus, but also in part to the growing scarcity and consequent high prices of suitable horses. A single instance of this may be mentioned. A Southwestern city in need of heavy fire horses could not buy them because the appropriation allowed only $350 per horse, whereas the prices for suitable horses ranged from $400 apiece upwards.

The outlook for the coming year in the commercial vehicle line is more than bright; it promses to be a record year. With the economies attendant upon the recent hard times, the attention of many business houses was called to the excessive cost and growing inefficiency of horse traffic. This has resulted in a thorough investigation of the power wagon and its merits, which will result in largely increased sales the coming Spring, or as soon as the horse equipment can profitably be disposed of. Many prospective buyers of trucks put it this way: We are going to change over to motor trucks, but must dispose of our horses and wagons first. This we will do in the Spring as soon as the market for horses and horse equipment improves. Winter being the poorest time to sell.

AUTOCAR, Autocar Co., Ardmore, Pa.—Autocar characteristics include several features of note, among which mention will be made of the fact that the chassis frame is of steel, in which hickory is accurately fitted to render the frame as a whole strong and to give a certain flexibility not to be realized in any other way. In the motors of the Autocar it is the custom to use two flywheels, and the crankcase design enables the operator to remove covers to get at the essentials, as the camshaft, crankshart, connecting rods, and for the purpose of making a general inspection. In the rear axle work is free from joints, and brazing is avoided. It is the idea of the Autocar designers to keep away from all the modes of procedure which, while they may work as a rule, do represent a percentage of failures on the count that workmen are not up to a high level of efficiency every day in the year, and to eliminate the chance of failure is to avoid the personal equation. As a strictly utility proposition, the Autocar should, and undoubtedly will, appeal to merchants and others with goods to transport.

CADILLAC LIGHT DELIVERY, Cadillac Motor Car Co., Detroit, Mich.—Like the product of other pleasure car manufacturers, this one-lunger does not differ in a marked degree from the single-cylinder touring car. The body, of course, must differ, and the driver's seat, too, but otherwise the differences are minor ones. This is not in itself a bad fault, for the success of these cars with drivers of mediocre ability in pleasure fields presupposes a duplication of this same success in the commercial work, where the driver is an unmechanical horse-driver. In the service of groceries, laundries, hatters, jewelers, shoe dealers, florists and similar business houses requiring a light weight but quick delivery, this car has been a big factor in the development of the industry. Its construction and method of operation, designed with a view to economical operation, has done much to favor its further use, an average of about $15 per month for all expenses, including fuel, by a Far Western company having about a dozen of these cars, showing what this sturdy little worker can do. As upkeep and fuel bills are those

watched with anticipated horror by the small fellow, who has just ventured to buy a delivery wagon, this little car has made good.

CHAMPION, Champion Wagon Co., Owego, N. Y.—The name of this line of electric trucks is indicative of their quality, Champion, the quality that makes champions, that is the keynote of the product. The full line consists of light trucks, delivery wagons and heavy trucks from 500 pounds capacity with a radius of 35 miles on one charge of 2,500 pounds with a 30-mile radius, and still larger, heavier cars with a smaller radius. All of the product has double motor direct drive equipment. Now that the economy of the electric vehicle has been demonstrated to the satisfaction of all who have investigated the subject intelligently, particularly for short hauls within the battery radius, it may be expected that a great number of these will be put on the market, being simpler to manufacture and build than a gasoline-driven car of equal carrying capacity. The electric may be relied upon to work in all kinds of weather, regardless of heat and cold, which cannot be said of the horse.

ELMORE, Elmore Mfg. Co., Clyde, O.—The popularity of the taxicab necessarily manned by horse-drivers has been partly due to efficient operation, which was only made possible by the inherent simplicity of the mechanism.

Champion Electric Express Truck.

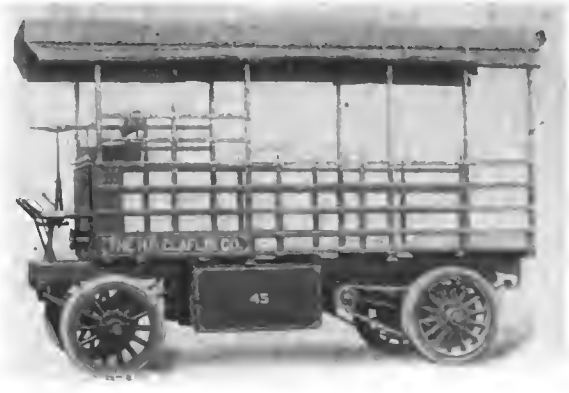
Among the few devices which have made this simplicity possible none rank higher than the two-cycle motor. Dispensing as it does with valves and all valve operating means, not only is the great number of parts materially reduced, thus reducing in the same proportion the spare parts which must be carried, but the sources of noise are reduced and the weight is reduced. More than all this, perhaps, is the feeling of security which the innate simplicity of this prime mover gives to the operator, with which comes also a sense of confidence, the whole resulting in superior operation. For these reasons this cab has made progress continuously from its inception to date, with the prospect of this continuing indefinitely in the future. No more promising field of development has been opened up in the history of the commercial car than that offered by cab construction. This company is to be congratulated upon an early and successful entry into this field.

FRANKLIN, H. H. Franklin Mfg. Co., Syracuse, N. Y.—The air-cooled feature of the motors on Franklin touring cars will be continued on their line of commercial cars also. These include L-1, a light delivery wagon of 1,000 pounds capacity; L-2, a heavy delivery or light truck capable of carrying 2,000 pounds, and J-3, a two-ton stake truck. Not only the engine, but the frame of wood, full-elliptic springs and other essential features will be retained. All of these vehicles have the engine beneath the floor boards and front seat, which materially

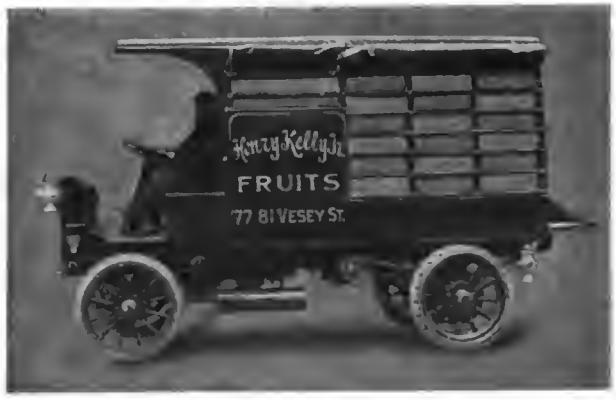
Police Patrol of the Franklin Company.

shortens the front end of the car and thereby decreases the wheelbase. The latter is a valuable feature on a commercial wagon, affording, as it does, facility in turning and manuvering in small spaces. Thirty-two-inch wheels are provided on all three types. The L-1 front wheels are 32 by 2 1-2 and the rear 32 by 3. The L-2 front wheels are 32 by 3 and the rear 32 by 3 1-2. The J-3 front wheels are 32 by 3 and at the rear 32 by 3, with twin tires. The J-3 has a stake platform with a carrying area of 62 1-2 square feet, the diameter being 5 by 10 1-2 feet. In these trucks a worm drive rear axle is used. The worm and the worm wheel are exceptionally large, and the tooth pressures are therefore at the minimum. The J-3 moves normally at the rate of about ten miles an hour and has carried a load of three tons up an 11 per cent. grade one-quarter of a mile in length and paved with brick. In all these commercial vehicles are used full elliptic springs in front and semi-elliptic and coil springs at the rear. This is productive of easy riding at the seat and increases the load capacity. The rear axle is in such position that it carries two-thirds of the weight. This also reduces the work of front springs.

GENERAL VEHICLE ELECTRIC TRUCKS, General Vehicle Co., New York City.—In the field of electric commercial vehicles there are few exhibitors; those who do show cars, however, will make up in quality for the lack of quantity. One of the most interesting sections will be that of the General Vehicle Company, of New York. This company is the successor to the Vehicle Equipment Company, the pioneer in the commercial automobile field and the builder of a large percentage of the electric power vehicles now in commercial service. Five of the seven sizes manufactured by this company will be shown, the smallest being a light electric delivery runabout with closed body, having a capacity of 350 pounds' load, a speed of 14 miles per hour, and a mileage of 50 miles'



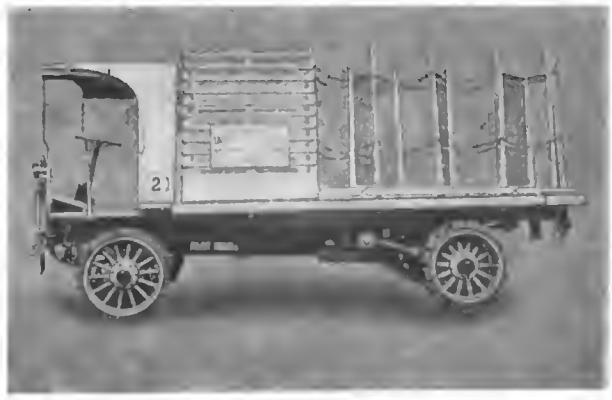
Heavy Truck of General Vehicle Company.



Two-Ton Truck of the Hewitt Company.

travel on one charge of the battery. Standard models of wagons having 1,000 pounds, 2,000 pounds, and 3 1-2 tons will be shown ready for work. These have a radius of action, respectively, of 40 miles, 40 miles, and 35 miles, while the speeds are 11, 10, and 7 miles per hour. A representative chassis of 2 tons' capacity also will be shown, illustrating the general design of all models of the power plant construction. The company has a modern factory in Long Island City, and is building many of the electric trucks and delivery wagons used in New York City. Its power vehicles are also in use in a majority of the large cities of the United States.

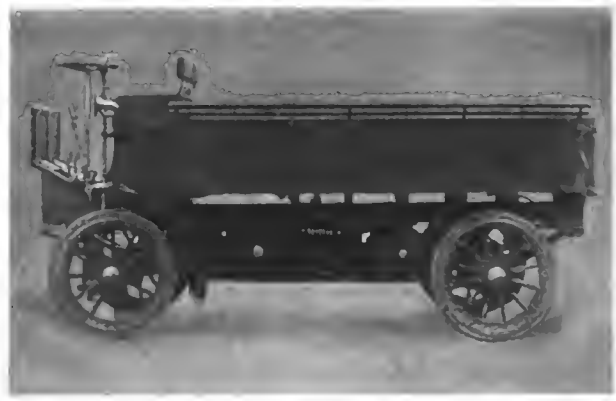
HEWITT TRUCKS, Hewitt Motor Co., New York City.—To give satisfaction a motor truck, or, in fact, any commercial car, must run continuously for a year or similar long time before overhauling. This necessitates the best of materials, workmanship and design. In the line of trucks produced by this firm the two former points have been sharply accented by the use of the best materials procurable in this country or abroad and the finest of workmanship both in the machining operations and in assembling. While in the latter, the matter of designs, opinions may differ, the fact remains that a very original and well-thought-out product has resulted. The left-hand control used by this company for several years past has now been copied by many other manufacturers, being the feature of the commercial exhibit at the recent show. In the matter of spring suspension for the radiator, planetary transmission, heavy long stroke, slow-speed engine and other advanced features, the industry has not yet copied these, good as they are, but this may be expected the coming season. The simplicity of the planetary transmission and its usefulness in the commercial vehicle industry for this reason have been appreciated and taken advantage of by several well-known makers. Hewitt has produced



Five-Ton Truck of the Hewitt Company.

an excellent example of this form of speed change device and operates the same with pedals, which are so interlocked that each one automatically throws the others out of engagement. This is an enclusive feature.

KNOX TRUCKS, Knox Automobile Co., Springfield, Mass.—These people were pioneers in the commercial field, and the lead which they then obtained has never been relinquished. At the present time they stand in a similar position with regard to motor-propelled fire-fighting apparatus. By this is included fire chiefs' cars, auxiliary squad cars, salvage and first-air wagons, chemicals and other strictly fire-department vehicles. That these wagons are economical and successful workers is shown best by the Springfield Fire Department's experience with their auxiliary squad automobile, which cost but $144.62 to run for a year, with $85.14 for repairs, as against $534 for horse service, repairs being equal. This formed a saving of $390 per year, which in a few years would pay for the car. Not only do this firm build fire wagons, but a line of excellent trucks as well, the latest of which to be announced is the five-ton truck. This big wagon has a 50-horsepower water-cooled motor with equal bore and stroke, 5 1-2 inches. The feature of this truck's cab and driver's seat, which is situated above the engine, is the large amount of space allowed to get at the motor. This



Light Truck of the Knox Company.

is also arranged so that the rear portion of it by loosening a few bolts may be turned over backwards out of the way. This feature is one that will be appreciated more by the truck driver than by the lay public, to whom it means nothing. To the former, on the other hand, this means a great deal in making repairs, as, for instance, in replacing a cylinder. When the cab is solid and low this is a bigger job than putting in a new engine transmission would be, but in this case it would be rendered comparatively simple.

PACKARD TRUCK, Packard Motor Car Co., Detroit.—Years of experience in the production of a superior touring car could not result otherwise than in the evolution of a superior truck once attention was turned to that field of endeavor. In the construction of the Packard truck the manufacturers turned to this problem the accumulated good experience of many years' producing in their three-ton power wagon, a prime mover of superior merit. It is not strange, in view of the foregoing statements, to find these trucks making good all over the country. A recent trip from Pittsburg to Wheeling, W. Va., demonstrated in a remarkable manner this fact. This distance of 67 miles, an unusually long trip for a truck of this high load capacity, was made in 6 hours 25 minutes actual running time, an average of about 10½ miles per hour. This was only meritorious when the hilly

mountainous character of the road is considered, viewed in which light it forms a remarkable performance. The figures for operation, including oil, gasoline and all supplies, are of equal interest, being but $2.09, which represents a cost per mile of $.0312. Now, with horses this would have been a two-day trip and two very big days at that, with a figure per mile of no less than eight or nine cents. So, without intending it as such, this long tour showed the marked superiority of the motor over the horse truck.

POPE-HARTFORD AMBULANCE AND PATROL, Pope Mfg. Co., Hartford, Conn.—In this newly opened field of hospital and police service the combined qualities of the speed and mobility of the pleasure car with the carrying capacity of the truck have served these vehicles as a starting point from which to make the greatest progress of any branch of the industry in the past year. The ambulance has an enclosed rear opening body provided with stretchers and low cots, as well as such modern equipment as an exhaustive study of ambulances and hospital appliances has enabled the manufacturers to say were necessary. The police patrol, while having an enclosed body also, has longitudinal permanent seats to accommodate ten or more policemen. The usefulness of this vehicle with its ability to take that many policemen anywhere in minimum time is self-evident. This may be had also, with the seats hinged to let down, giving room for a bed or cot and thus converting the wagon into an ambulance. By the use of this style of equipment the same car does double duty. Later construction, the details of which have not yet been given out, state that this same chassis may be fitted up for a chemical or a hose wagon.

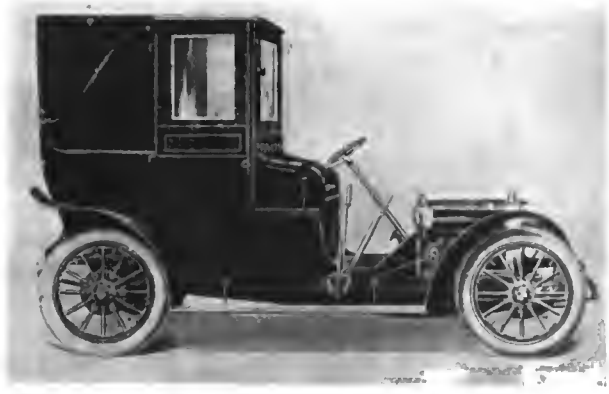
SAMPSON TRUCK AND ROAD TRAIN, Alden-Sampson Mfg. Co., Pittsfield, Mass.—Without a doubt the most interesting exhibit in the line of heavy commercial cars will be that of the Alden-Sampson Manufacturing Company, which will exhibit its road train, and for the first time a new four-ton truck. The latter will make its initial bow to the public at that time, but the former will be a repetition of the exhibit of last year. The latter will be awaited with interest by the trade at large, as the details of this machine, which have thus far found their way into print, have been few and far between. With a four-cylinder water-cooled vertical motor of 5-inch bore and equal stroke, rated at 40 horsepower, this truck is well equipped. In the change speed gear, with four forward speeds operating on the selective principle, a new idea in truck construction is advanced, this being the first truck to have a four-speed transmission.

Studebaker 1500 Pounds Delivery Wagon.

The road train is probably the largest motor carrying arrangement made in this country. The ordinary four-wheel truck reaches its maximum carrying capacity at about five tons, overloads of 50 per cent. bringing this up to 7 1-2 tons. In this road train, then, we have the next largest unit. It consists of a tractor furnishing the power and arranged to carry 3-4 tons load as well. The trailers drawn by this tractor, which have six steel-lined wheels similar to it, have a capacity of 6-8 tons each. This allows of 9-12 tons with one trailer and so on with more trailers up to three, which would give a carrying capacity of 21-28 tons.

STUDEBAKER ELECTRIC TRUCK, Studebaker Automobile Co., South Bend, Ind.—The electric truck or wagon was one of the first developments of the automobile movement, and the pioneers in this include the Studebaker line. These are complete, covering the whole demand in six standard sizes, with paying load capacities from 800 pounds by natural steps up to five tons. In any one of these any type of body may be had to meet the requirements of wagon and truck users. The electric truck for all ordinary service, not including long hauls, has been shown to have many advantages, chiefly on account of the freedom from frequent adjustments and the fact of electric motors having a revolving, not a reciprocating, motion. An additional point in their favor and one that is along lines which may be strictly up to date, is the fact that the ease and simplicity of operation of electric wagons is remarkable. The reputation of the parent Studebaker house is extended to cover the commercial vehicles, as well with the result that the motto of "the automobile with a reputation behind it" may be applied with equal force to the power wagons, considering the word automobile in its broader sense to include all of the former.

The Road Train of the Alden-Sampson Manufacturing Company.



Thomas Town Car, 18-Horsepower.

THOMAS TOWN CAR, E. R. Thomas Motor Co., Buffalo, N. Y.—The recently developed field of taxicabs and town cars is one that many pleasure manufacturers have ventured into. No list of these would be complete unless it included the firm which evolved the discussion-producer when they made public the details of their cab chassis, the Thomas town car. This was one of the first American cars with a block motor and probably the first with two bearing crankshaft, these bearings being of the radial ball type. This construction allowed of a remarkably short engine. This in turn favored a short wheelbase, which, taken in conjunction with the narrow tread allowed of the short radius of turning action so necessary on these public service cars. The instant successful use of these cars in all of the large cities, Boston, New York, Washington and others, placed this manufacturer at one bound in the rank of able small car builders, his previous position having been with the large car only. These cars are elegant in their appointments and their use is not restricted to the public service by any means. In fact, town cars have become very fashionable with exclusive people for shopping, theaters, calling and all fashionable functions, and in this field are gradually supplanting the horse broughams, coupés, victorias and station wagons so generally used. Being primarily designed for this work and constructed with that end in view, they do not qualify in any sense in the same category with the ordinary small touring car adapted to this service by the application of a closed body.

WALTHAM MERCHANDISE WAGONS, Waltham Mfg. Co., Waltham, Mass.—In commercial work by far the largest field exists for the smaller lower-priced cars, which, just because they are smaller and lower powered, are within the range of usefulness and purchasing ability of the masses, the butcher, the baker and candlestick maker, as it were. The Waltham Manufacturing Company has shown discretion in confining themselves to this field exclusively, with a chassis having horizontal opposed water-cooled motor, bevel friction transmission and double-chain drive. This chassis may have any body suitable for the work it is to do. The entire power plant, consisting of motor, radiator, cooling system, friction transmission and countershaft, are mounted on a pressed steel sub-frame, which can be quickly disconnected and dropped down upon a truck and removed for convenient repairing or the substitution of a reserve power plant, in this manner keeping the car or a number of cars constantly in commission. The exchange can be made in less than an hour. This is economical and convenient for the merchant using a number of cars, for an emergency car will not be necessary. This principle of grouping parts is carried throughout the entire construction, the power plant itself being subdivided into smaller groups of co-acting parts, interchangeable with similar groups kept in reserve for quick repairs.

WAVERLEY ELECTRIC TRUCKS, The Waverley Co., Indianapolis, Ind.—These new people, successors to the Pope Motor Car Company, will continue that firm's unexcelled line of electric commercial cars. These have a very wide range from eight-passenger or 1,200 pounds up to five tons, the latter size being a favorite among the brewers. In considering the question of power wagons, urban and interurban service must be separately considered, the data, considerations and principles controlling the service being quite different in the two cases. It is generally considered that the latter, the interurban, offers the greatest field for the gasoline car, the inherent limitation of the storage battery precluding the operation of electrics over distances close to or greater than the battery radius. The urban or city service, on the other hand, gives a field in which the electric may compete on nearly equal terms. It is in this field that the greatest competition does exist and in which the electrics more than hold their own. Any one familiar with the Adams Express service in Buffalo or Macy's department store delivery service in New York City and many others will see the truth of this statement at a glance.

ADVISABILITY OF PROPER SELECTION.

With a display of vehicles in the commercial section to fill every possible want, it remains for the users to look the situation over with a display of acumen and avoid the mistake of a half-hearted selection at the cost of ultimate failure. When horses are considered, the best is counted none too good. When it comes to power wagons, the same holds true, only to a more marked degree. An appropriate selection is one in which the vehicle is not only suited to the work to be done, but it remains for the purchaser to take into account the future. If the business is one which partakes of permanence it certainly will pay to put enough money into the vehicles to make sure that upkeep will be moderate.

Style is not so much a factor in commercial work, and it is fair to assume that repairs will be made year after year until the car is as the proverbial "jack-knife"—nothing but the handle left, etc. Upkeep is tolerable in a well-designed power wagon, just as it is in any well-designed machine for any purpose. But it must be well designed, and it must take into account the fact that it is intended for continuous service. If the bearings are of the kind which can be replaced, then it is plain that when they are too loose to take up or replace them will be the proper thing to do, and the cost of the replacement should be but slight. If, on the other hand, a car is of a half-baked design, it is possible to believe that the bearings cannot be replaced unless at a cost which will serve as a ban to the process.

If the power plant is one to stand the road inequalities and the high "torque" phenomenon, then it will be possible to take into account a continuity of the service over a term of years. But should the motor and the transmission be distorted by the high torque, then it is assured that the power plant will go beyond repair within a short while and a new power wagon will be the best solution of the problem. All these matters have to be considered, and it is worth while to consider the competence of the builders of the power wagons contemplated for use in a given service, and ascertain if the wagons are truly in accord with the requirements. The cars at the Garden are wisely selected to illustrate competence.

PROMISING VALUE OF THE A. L. A. M. LABORATORY

By THOS. J. FAY.

FORESIGHT eliminates gradient and serves as a lubricant for the ways leading in a bee-line to the greatest possible satisfaction all around. The "Twentieth Century Limited" starts from the "laboratory." But the laboratory in itself is of almost no value at all. The information must be appreciated, and the dictum of the laboratory must be the rule and guide of the constructor. The mere knowing makes for nothing, unless it can be said that crime, if such there be, consists in knowingly doing wrong. At all events, it is not only desirable to have a laboratory, but it is important to conduct the process with the greatest possible care, and the knowledge allowed to emanate should be from what might be termed a "high source," of undoubted competence.

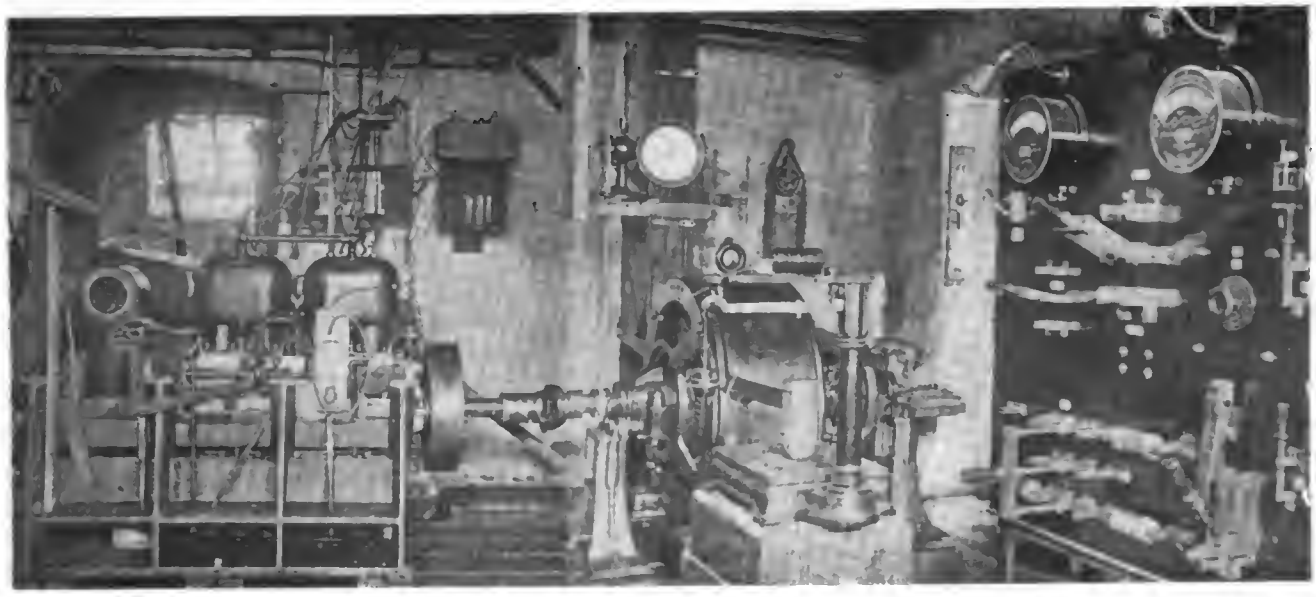
When the automobile reached a certain point in its development it was the consensus of opinion that something was lacking, and that something was prone to manifest itself as materials or the proper utilization of the materials available for the purpose. When the question was ripe for discussion, then it was that the A. L. A. M. took time by the forelock, and in establishing the "Mechanical Branch" refrained from tieing the hands of the directors of the same, while they, in turn, free to follow their own bent, made bold to pave the way to success by the road called knowledge, even at the expense of prolonged and painstaking investigation, at a cost, which, reckoned in the abstract, footed up to a pretty penny.

As a concrete proposition, the cost was a mere *brutum fulmen;* in other words, a harmless thunderbolt; harmless in the sense that the cost was slight on a pro rata basis, and a thunderbolt from the point of view of the surprises in store for the men who previously thought that the fabricators of steel had kindly imparted all of knowledge that was good to know.

It is claimed that in Russia the common people should not know too much. The users of steel were as the common people, and they were fed on a baby food that failed to impair the digestion of the feeders. On the other hand, it cannot be said that the eaters gained in weight, especially in the region of the pocketbook. The laboratory was the place in which the proportions of the food were ultimately fixed upon in accord with the dictates of what might be called a "balanced ration," which balance showed a lacking as the situation did obtain prior to the advent of the laboratory.

At first the several makers of automobiles looked askance at the doings of the "Mechanical Branch," primarily because the cost looked out of proportion to the results, and, again, in view of the propaganda of the venders of material, ever ready to promote a fallacy if the same would only serve as a trough or a chute, down whose slippery concave money would flow to keep the water from evaporating out of the stocks, which to the one who can read spells high price and low quality of the materials emanating from such sources.

On the other hand, automobiles were imported from abroad, the reputations of which were so good as to cause wonder in the light of facts under the nose of every American builder. Why the American cars would not stand the pace, was the question, and as one French designer put it: "Copy the car if you like; make everything in exact replica; it matters not, the car will not be the same." The question was, Why?



Electric Dynamometer for Use in Determining the Actual Horsepower of Automobile Motors.

The learned gentleman from France was telling the truth, and he know that the "quantity makers" in America would defeat every attempt to interject quality if it was a question of the quality of the steel. Just so long as the makers of automobiles were content to depend upon the salesmen of the steel mills for the information they required, just so long was it possible for the steel makers to keep to the quality of the greatest dividends—for them, not the makers of cars. It was rather strange to see the makers of automobiles taking instructions from "salesmen" from the steel vendors, using the "Bessemer" they were so anxious to get rid of. The same makers of automobiles did not allow their own salesmen to dictate as to the designs in the engineering offices of the makers of automobiles.

The great importance of the laboratory was not, at first, quite so apparent as it is to-day; nor is it sure that every user of automobiles understands the situa-

tion with that vividness which impresses itself upon one, when he counts the money in his own "till," only to discover a material shortage. It may seem a little farfetched to thus prolong the discussion without elaborating upon the details of the laboratory itself, but it is desirable, as is adequately shown by simply relating the story of the hunter who, after a rabbit, uncovered coal, in the process of digging the rabbit out of his burrow, and so hot was he in his quest for game that the value of the coal was measured in curses because it was in the way.

It would be as a waste of time to talk about a few machines and measuring instruments, however precise they may be, without drawing a picture of sufficient clearness to establish the facts so that they will find lodgment in the "think-tank" of the reader. It is like "skimming" over a story.

In the laboratory it is the aim to get at the inner facts and to account for the successes and the failures in a way that leaves no room for doubt. A piece of steel is a very uninteresting bit of matter to the man who has no depth of knowledge; this same piece of steel is an adequate subject for the greatest mind during the interval from maturity to the grave. But if the steel is of interest, so are the wood and the oil, the gasoline and the varnish; all can take time, and in each will be found something that will persist in defeating success in the absence of knowledge of the proper means of thwarting the ills.

Souther Testing Machine.

The steel maker says: "You do not have to know what the composition is so long as the material will do the work." The same good samaritan says: "Leave it to me." When it was found that the steel would not hold together the question was, What is the composition of the material which proves to be of no fitting value? To know is to analyze, and a chemical research demands the equipment for the purpose. The conclusion was that a chemical division in the laboratory was as necessary as the roof over the building to conserve the heat in the Winter time.

Next, it was decided that the conventional physical properties of the materials would serve as a rough guide to the facts to be elucidated in the long run, by means of more exacting tests of the materials, the qualities of which indicated value to the extent to make further research worth while. The result was a testing machine had to be provided, one with the wide range to handle iron, with its low strength, on the one hand, and nature hard alloy steel on the other; as well as all the materials within the top and the low limits.

Then it was desirable to be able to note the texture of the materials, and to just look at them with the naked eye was not to be able to see the real situation. Mycroscopic work was regarded as of the greatest value, and "photomycrographs" would make the records permanent. This equipment is probably quite as important as any, since it has been fully established that steel resides in several conditions, depending upon the composition and the mode of fabrication, not to mention the fact that heat treatment does alter the texture of the steel for good or for ill.

Equipment for Heat Treating Steel.

In due course it was established that the "static" ability of steel had little to do with the facts, from the point of view of life of the same, under conditions involving "kinetic" work. The older methods of fixing upon what was called the "shock ability" were not to be regarded, but it was soon found that this shock ability was not to be considered as a fair measure of dynamic ability from every point of view. There was the question of the effect of vibrations, within, let it be said, well within, the elastic limit of the materials.

It was this latter question which proved to be of the greatest importance, and the "vibratory test," though long, and even costly, did in the end pronounce the quality of the material in terms which were not to be lightly thrust aside. When Henry Souther took hold of the matter, it did not take him long to devise a machine by means of which the vibrations could be artificially induced into test specimens, and the life of the materials under such conditions could then be measured with the greatest certainty.

In the meantime the shock tests of "Fremont" and other methods were taken advantage of, in order to accumulate all the knowledge possible in relation to the materials to be used in the automobiles of the Licensed Association. In these several ways, under the guidance of the committee of the Mechanical Branch, the questions were all thrashed out, and it was in thus going at the matter which led to the American supremacy of the automobile.

In the meantime it was necessary to be able to show that actual improvement could follow, else what would be the gain in thus maintaining a costly situation? To be able to fix upon the gain it was necessary to devise testing equipment such as would allow of the cars being tested, in order to show the power developed and the manner in which the same was actually utilized, taking into account the several losses. Thus was it necessary to go into the analysis of the performance of the cars, and by so doing determine

Chemical Equipment for Analyses.

the extent of the losses, and to the extent possible, eliminate the losses or reduce their magnitude.

All these questions were taken up, and by a systematic course of procedure the whole situation was reduced to A B C. True, it is the A B C of the technical man and the language are foreign to the average autoist, or to the inventor whose ability consists in evolving an abstract idea. On the other hand, the men of ability were there, and they devoted themselves to the task in a manner which is now proven by the quality of the automobiles (as a whole) to be seen at the Garden.

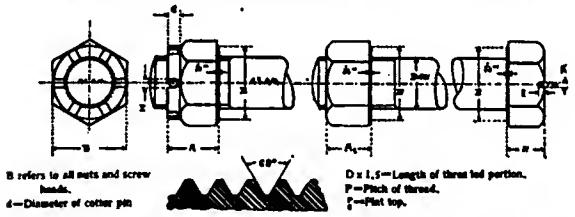
The illustrations of the equipment in the laboratory of the Mechanical Branch of the A. L. A. M. will give to the interested reader a fair idea of the scope of the work, and, in some measure, tell the reasons why the cars on exhibition are as good as they are said to be. This same laboratory is the great incentive, the excuse, in fact, that the steel makers use in their increased endeavor to deliver better

Association of Licensed Automobile Manufacturers.

STANDARD FOR

HEXAGON HEAD SCREWS, CASTLE AND PLAIN NUTS.

The following drawings and table (from Mechanical Branch Bulletin, No. 18) give in summarized form details as to the screws and nuts:



D	¼	9/16	5/8	11/16	½	9/16	5/8	11/16	¾	7/8	1

DIMENSIONS.

All dimensions in inches.

FINISH.

All heads and nuts to be semi-finish.

MATERIAL.

For all screws and nuts—steel,

Tensile strength, not less than 100,000 lb per square inch.

Elastic limit, not less than 60,000 lb. per square inch.

material, and the one remaining question is, Will they ultimately put the price down to the point such as will enable the users of automobiles to get what they are entitled to at a fair cost. True, the cars are reduced in price this year; equally true, the quality is on a high plane, yet even so, Carnegie is authority for the impression which in substance is to the effect that the public is being milked. In conclusion, it is easy enough to say that the laboratory of the Mechanical Branch has established the fact that the materials should be up to a certain fitting standard, and the makers of the cars were enabled to reduce the price of the cars by thus eliminating the failures in service; they cost money, since the defects have to be made good. It remains for the steel maker to reduce the cost of the material to a point indicating a fair return to them, when, lo! the buyers of automobiles will then be in a position to realize further the great advantages due to the up-to-date methods of the A. L. A. M.

Among the advantages of the laboratory will be mentioned by way of immediate results the improvements wrought in the several grades of steel used in the parts of the greatest responsibility. Prior to the establishment of the laboratory it was not uncommon to note spring

Pulled Test Specimen.

Cold Bending Test.

breakages on a scale which could not be tolerated, unless as a temporary condition pending the time when it would be feasible to introduce suitable grades of steel for the purpose. In the laboratory it was possible to examine the grades of steel which failed in service, and, knowing the characteristics of the same, decline to use more. Of the grades of steel in which the requisite qualities did seem to reside, it was possible to learn more and to improve the "formula" so as to lend haste to the process as well as the quality of the steel and bring the cost down.

Besides spring steel there were grades of alloy steel used for crankshafts and for gears. They had to be investigated, and in the due course of events the whole matter was sifted down, eliminating every stray suspicion of mystery and improving the steel for the respective purpose, besides reducing the price to a point within the striking distance of the buyers of automobiles. But the greatest advantage came by way of the investigation of the various means by which carbon steel could be improved and in the process imbued with kinetic properties.

In automobile work, unlike structures, it is of the greatest importance to give to the steel the ability to withstand shock and high-frequency vibrations. It is a fact that a piece of steel which might sustain for ages in a bridge would "fag" out in a few days in an automobile. Knowledge of the limitations and of the ability of the various grades of steel was gained in the laboratory, and a series of "treatments" enabled the A. L. A. M. to determine the improvements wrought by subjecting the steel to the several heat treatments for the purpose sought.

It is not alone a question of steel to be investigated. Take, for illustration, aluminum; it was quickly ascertained that if the walls are thin the materials are of greater strength than will be true with thick walls. On the other hand, it is assured that noise will follow if the walls are thin. Under the circumstances the designers were enabled to follow a course such as would afford the maximum strength consistent with noiseless performance. In the same way many questions were disposed of, and automobiles were brought to a high estate.

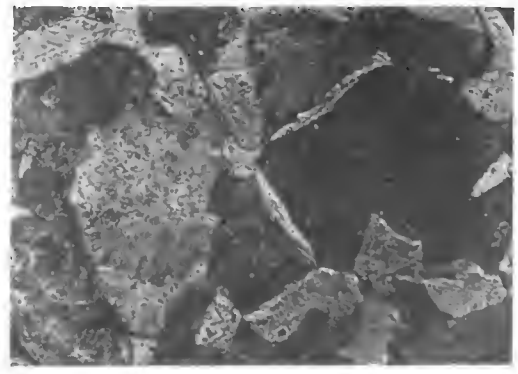

Photo Micrograph of Steel.

AMERICAN AUTOMOBILE STEEL

By HENRY SOUTHER, A. L. A. M.

EVERY known steel used for commercial purposes is just as available in the United States as anywhere else in the world.

Norway and Sweden have unusually pure ores, but the raw materials made from them are just as readily obtained here as elsewhere. There is no mystery about them; they are just pure and good. When our fine steel makers want good raw material they get it, whether it be from Sweden, Spain, Africa, Cuba or Lake Superior. Our steel makers are just as well trained as any and can make the best of steel.

They do not always make the highest grades of steel, because the demand does not always exist. Here, then, lies the real reason why early automobile product in the United States was not of high-grade material. It was not demanded. On the contrary, by some it was pooh-poohed; the advocate of fine steels was laughed at. "Why buy 15-cent steel when steel could be had for 2 cents?" "With our design any old steel will do," was sometimes heard. Our earliest makers (with exceptions, of course) did not have time to think about what kind of steel they might use. They were too busy making something that would go and keep on going.

Now all is different; the pendulum has swung the other way; some are buying 15-cent steel and putting it where it does no more good than 2-cent steel. Popular opinion demands it, and it is advertised. Many, however, have at all times kept pace with the art and began to use high-grade, high-priced steels, as far back as 1900, where such steels were called for.

Steels were tried and fully proven. Expert knowledge was used conservatively, and there was no violent swing of the pendulum from the worst to the finest, from one extreme to the other. No advertising was done. A trade secret could not have been guarded more closely. Good cars were built. The secret of the use of steel is to put the *right steel in the right place.*

The highest-priced imported steel suited for horseshoe nails would not do for an automobile spring as well as the lowest-priced, lowest-grade Bessemer steel made; or, for another extreme, the best chrome-tungsten tool-steel at 60 cents a pound would not make as good rivets as ordinary steel at 2 cents.

It is not always best to use the very best, the ideal steel, for a purpose. The very best is sometimes difficult to handle commercially. Better results may in some cases be obtained by using a slightly less ideally desirable steel. This brings up the importance of handling steel. Much skill has always been expended in handling tool steel; it has always been regarded as most important.

Not so with structural steel; and yet just as much is to be gained by handling it so as to produce a strong, tough material, capable of sustaining shock, vibration and the banging it gets, in an automobile.

The makers of guns, armor-plate, propeller-shafts for torpedo boats, have for many years practiced with much skill the suitable treatment of structural steel; but these people and their engineers did not, generally speaking, start the manufacture of automohiles; so this skill was not fully used by the automobile builder.

Some engineers went from the one industry to the other, carrying this valuable knowledge. These men helped to produce the high-grade cars made in this country, which have been every bit as good as any cars in the world, so far as materials and wear are concerned.

All steels were available; and in the United States the right steel was selected for a purpose. It was properly handled and treated from start to finish, the result being a perfectly balanced car, so far as wear was concerned. No more could have been done in Europe or elsewhere. Worse has been done in Europe, as shown by the way some imported cars have disintegrated after about two years' use.

In other words, the materials are available everywhere; the knowledge of how to use them is not. That is the difficulty. Breakages are due quite as often to bad design as bad material. The worst of it is that the bad designer may be found in combination with the bad chooser of materials. He "knows it all."

In this same direction it is unfortunate that too many automobile companies are born to develop a "world-beating idea" regardless of materials, design or anything else. It is unfortunate that such concerns live long enough to put automobiles on the market, but they do because some rich victim usually gives up long enough to do just this and to find out that there are other things required in an automobile than an idea even if it be a "world beater."

The right material for such to use was at hand but was not selected, and even the "idea" was ruined perhaps by not using the right material in the right place.

Some builders of fine machinery (at the head of their kind) have started cheerfully into automobile making, using the same materials and same designing methods modified to suit the new business, only to discover at great cost that the automobile is "different." They did not call in any help; why should they if at the head of their profession?

The knowledge and materials were available but were not selected, and yet some people blame such failures to the fact that the United States cannot make the fine steel found in Europe.

Unfortunately those who know the least about steel and its treatment are continually rushing into the public press and spreading a lot of rot about steel. Such stuff is read by many who ought to know better and is followed to their harm. The good steel is there just the same, awaiting intelligent selection; and good cars are made by those who select wisely. At the same time, it must not be forgotten that it is quite possible to make a sturdy and good car with no expensive steel in it.

The design must be right, however. The product will not be light. Until very recently no steel other than simple carbon steel ever entered into the construction of the best locomotives. They did not need to be light, and long experience had produced a suitable design. Several excellent automobiles built of relatively ordinary steel, but with design and material suited to each other, exist and have done splendid work.

All this goes to show that the materials are to be had for the asking at a price. The problem is to know what to ask for and how to get best value for money spent, all things considered; what is right for one job may be wrong for another, nor is it suggested that free advice be accepted from steel makers.

OUTLOOK IN THE AMERICAN AUTOMOBILE INDUSTRY

By E. P. CHALFANT, General Manager A. L. A. M.

IN many fields of engineering there has been a most interesting evolution by way of improvement in materials, design and methods through the reciprocal effort of the constructor and the metallurgist. In no case, probably, has that advance gone further in recent years than in the higher grades of machinery. The combustion motor, the motor car, and by no means least, the modern tool, have stimulated investigation and led to discovery of new and most useful alloys.

In solving the problems of the automobile builders, notably in getting the requisite combination of strength with limited space and weight, important developments have been accomplished which have a bearing on general machine construction. Inventive genius was forced to overcome difficulties which had never been encountered hitherto, except, possibly, in a limited way.

In this work the Association of Licensed Automobile Manufacturers has played a most conspicuous part. The membership of this Association is as follows:

Apperson Bros. Automobile Co.	Kokomo, Ind.
The Autocar Company	Ardmore, Pa.
Buick Motor Company	Flint, Mich.
Cadillac Motor Car Company	Detroit, Mich.
Chalmers-Detroit Motor Company	Detroit, Mich.
Corbin Motor Vehicle Company	New Britain, Conn.
Electric Vehicle Company	Hartford, Conn.
Elmore Manufacturing Company	Clyde, Ohio.
Everitt-Metzger-Flanders Co.	Detroit, Mich.
H. H. Franklin Mfg. Company	Syracuse, N. Y.
The Haynes Automobile Company	Kokomo, Ind.
Hewitt Motor Company	New York City.
Knox Automobile Company	Springfield, Mass.
The Locomobile Co. of America	Bridgeport, Conn.
Lozier Motor Co. of New York	New York City.
Matheson Motor Car Company	Wilkes-Barre, Pa.
Packard Motor Car Company	Detroit, Mich.
The Peerless Motor Car Company	Cleveland, Ohio.
The George N. Pierce Company	Buffalo, N. Y.
Pope Manufacturing Company	Hartford, Conn.
Pope Motor Car Company	Toledo, Ohio.
The Royal Motor Car Company	Cleveland, Ohio.
Alden Sampson, 2nd	Pittsfield, Mass.
Selden Motor Vehicle Company	Rochester, N. Y.
The F. B. Stearns Company	Cleveland, Ohio.
Stevens-Duryea Company	Chicopee Falls, Mass.
Studebaker Automobile Company	South Bend, Ind.
E. R. Thomas Motor Company	Buffalo, N. Y.
Walter Automobile Company	Trenton, N. J.
Waltham Manufacturing Company	Waltham, Mass.
Winton Motor Carriage Company	Cleveland, Ohio.

It may be said unreservedly that through the efforts of this Association, the standard of American automobile steels which in past years have been looked upon in a secondary light has been raised to a plane even higher than that of foreign manufacture.

Standardization is what many users have longed and hoped for. The A. L. A. M. has brought this about, notably in screw threads, rod and yoke ends, spark plug shells, motor power rating, etc. During the past four years new standards for the various metals used in automobile parts have been worked out and annually compiled, with notes and instructions on the proper handling of the same, for the A. L. A. M. members.

The great development of four or five years has been the refinement of construction, aiming at absolute reliability; and the proof of the success is seen in the 150,000 automobiles now continually running in the United States. Incidentally, it may be said truthfully that the American automobile is the machine par excellence of the world for interchangeability of parts. To-day also we find the American-made automobile, not alone the product of a few, but of at least thirty manufacturers, a match for the best foreign car in world-wide use, and for unusually severe road conditions, like those of our own country, where our machines were developed (not on the boulevards of Europe), superior in many ways.

This has been conclusively and forcefully demonstrated by the magnificent American cars and classes shown at recent exhibitions, more particularly at the stands of the members of the Association of Licensed Automobile Manufacturers, and by the eminently satisfactory service of these cars for years in the hands of private owners and in contests of nearly all kinds, in which foreign-built cars have participated, or, for some reason best known to their backers, not been entered.

As an example of the superiority of the American car in hard usage, as is well known, the Thomas, an ordinary car selected from stock, was the winner of the race around the world. The Locomobile won the recent Vanderbilt Cup Race, in which representative foreign cars were entered. The Pierce Arrows, as well as other Association cars, have for year made perfect scores in the Glidden tour. The Franklin holds the time record for trips by automobile across this continent. Recently a Packard touring car was driven from the Pacific Coast here, by a gentleman who was accompanied by several members of his family, including the women. Two women alone have crossed the United States in a Waltham buckboard. This list of accomplished marked achievements by Association cars could be much added to.

If it had nothing else to recommend it but its time-saving and health-giving attributes, the automobile would be a permanent institution. But it is as a vehicle of commerce that it is to figure more prominently in the future. The world wants labor-saving devices; the automobile is one. Manufacturing plants find hauling their product with motor cars economical from every standpoint. The automobile is becoming a part of every well-regulated municipality in the health and fire branches of the public service. We often see cases of self-propelled vehicles coming back from fires, meeting the horse-drawn vehicles of the fire department going out. The Federal Government is converted to the utility of motor vehicles.

In isolated sections of the country, far from the beaten paths, the miner and farmer use the horseless vehicle.

The United States produces annually something like 80,000 automobiles, while France produces about 40,000 and Italy 25,000. Germany is another producing nation. Taking the average price of cars produced in the United States, as low as $1,500, it is seen that the aggregate annual output of cars in the country is well over a hundred million dollars, figures which place the automobile industry of the United States in a class by itself.

Although the twelve months ending November 1 represented a period of tremendous business depression throughout the entire country, affecting in particular all manufacturing enterprises, a comparison of the figures of the previous year showed clearly that the slightly decreased volume of good business is due to conservatism rather than a falling off in demand for cars. Furthermore, the decrease appears in total value of sales rather than quantity of cars sold; the aggregate sale of Association cars being within 500 of the total for the preceding year.

CONCERNING THE A. L. A. M. HORSEPOWER FORMULA

By G. H. GODLEY.

THE horsepower formula adopted by the Licensed Association last year met with such a favorable reception from both makers and users of automobiles that its continued use is assured. Before its appearance there had been a long-felt need for some connecting link between the size and probable capacity of various motors and the more or less imaginative ratings of their manufacturers. Between the "French rating," and the double rating, and the maximum rating, and the plain American rating, it was impossible to get a clear idea of what any motor could do, and a formula which offered an easy means of comparison was hailed with delight.

Most of the objections to the A. L. A. M. formula are based upon the idea that it is intended to determine once and for all the power which a given motor is capable of developing. Any such claim or expectation is on the face of it ridiculous. The horsepower of a gasoline motor cannot be calculated from its dimensions by any formula whatsoever, no matter how intricate and learned in appearance. As well try to calculate from a scale drawing the number of cubic inches of iron in a complicated cylinder casting, when the result could be obtained by weighing the casting itself. The way to find the actual horsepower of a motor is by brake test; but as this is hardly practicable for the average man, the next best scheme is to find some simple means of comparison based on dimensions. This is the purpose of the A. L. A. M. formula. It is essentially not a dogmatic statement, but rather a ratio. If we had two four-cylinder motors, one of 4-inch bore, the other of 5-inch, we might say that the power of the first is to the power of the second as 16 is to 25. That would be simple, but rather abstract. The A. L. A. M. formula would say that when the first develops 25.6 horsepower the second develops 40. That is almost as simple, much more intelligible, and still sufficiently accurate for every-day use.

Another cause of trouble is the rather formidable-looking decimal fraction often involved by the formula, as in the "25.6 horsepower" above. This, say the opponents, is not only cumbersome, but misleading, in that it would indicate a much higher degree of accuracy than is warranted by the facts. True enough; and most manufacturers using the formula have yielded so far as to drop the objectionable fraction altogether, or to use instead the nearest whole number. Yet it seems that the fraction has some excuse for its existence, in that it shows unmistakably that the rating is by the formula, and not the usual piece of guesswork. For this very reason the writer would even favor the addition of a cipher when the result does happen to be a whole number, as "40.0 horsepower" for "40." This, however, is unimportant, and will be decided best by usage.

After the theorists have given up the idea of absolute accuracy it is easy to see that the quality really the most desirable is simplicity. Here the A. L. A. M. formula has an unquestioned advantage. It would be impossible to simplify it any farther and still retain the least approach to a horsepower rating. There are, however, one or two short cuts which might not appear to the hurried user. For instance:

$$\text{H.P.} = \frac{D^2N}{2.5} = .4\ D^2N$$

(D is the cylinder bore in inches, N the number of cylinders.) It is much easier to multiply D^2, N and 4 together and then mark off one decimal place than to divide by 2.5. For the metric system (D in millimeters) the formula becomes

$$\text{H.P.} = \frac{.00155\ D^2N}{2.5} \text{ or simply } .00062\ D^2N$$

Still further convenience may be obtained by the use of a table such as the accompanying one, especially for fractional values of the bore. The table is in the main self-explanatory, but a few features may be pointed out. The values given are so close together that intermediate values may be found by interpolation, as in trigonometric and logarithmic tables. Thus: 4 1-16 is half way between 4 and 4 1-8; and consequently the power of a four-cylinder 4 1-16-inch motor may be taken half way between the values for 4 and 4 1-8 inches, that is 26.4 horsepower. As horsepower by the formula is proportional to the square of the bore, doubling the bore multiplies the power by four, and halving it divides by four. Applying this to the table, the power of a 2-inch cylinder will be one-fourth the power of a 4-inch, or 1.6 horsepower; and the power of a four-cylinder 7-inch motor will be four times that of a 3 1-2-inch, that is, 78.4 horsepower. Again, the position of the inch and millimeter values opposite each other gives a ready means of translating millimeters into inches.

As a final criticism of the formula, and a warning against its too-confident use, it will suffice to say that it tends to overrate small motors and underrate large ones. This really makes little difference, for no one is as interested in a close comparison of a 3-inch and a 6-inch motor as he is in ones of more nearly the same size; and within the variation of an inch or so in the bores the formula is very reasonably accurate.

TABLE OF A. L. A. M. RATINGS.

BORE (Inches)	One Cyl.	Two Cyl.	Four Cyl.	Six Cyl.	BORE m.m.	One Cyl.	Two Cyl.	Four Cyl.	Six Cyl
3	3.6	7.2	14.4	21.6	75	3.5	7.0	13.9	20.9
3 1/8	3.9	7.8	15.6	23.4	80	4.0	7.9	15.9	23.8
3 1/4	4.2	8.4	16.9	25.3	85	4.5	9.0	17.9	26.9
3 3/8	4.6	9.1	18.2	27.3	90	5.0	10.0	20.1	30.1
3 1/2	4.9	9.8	19.6	29.4	95	5.6	11.2	22.4	33.6
3 5/8	5.3	10.5	21.0	31.5	100	6.2	12.4	24.8	37.2
3 3/4	5.6	11.2	22.5	33.7	105	6.8	13.7	27.3	41.0
3 7/8	6.0	12.0	24.0	36.0	110	7.5	15.0	30.0	45.0
4	6.4	12.8	25.6	38.4	115	8.2	16.4	32.8	49.2
4 1/8	6.8	13.6	27.2	40.8	120	8.9	17.9	35.7	53.6
4 1/4	7.2	14.4	24.9	43.3	125	9.7	19.4	38.7	58.1
4 3/8	7.7	15.3	30.6	45.9	130	...	....	41.9	62.9
4 1/2	8.1	16.2	32.4	48.6	135	...	....	45.2	67.8
4 5/8	8.6	17.1	34.2	51.3	140	...	....	48.6	72.9
4 3/4	9.0	18.0	36.1	54.1	145	...	....	52.1	78.2
4 7/8	9.5	19.0	38.0	57.0	150	...	....	58.8	83.7
5	10.0	20.0	40.0	60.0					
5 1/8	...	....	42.0	63.0					
5 1/4	...	....	44.1	66.1					
5 3/8	...	....	46.2	69.3					
5 1/2	...	....	48.4	72.6					
5 5/8	...	....	50.6	75.9					
5 3/4	...	....	52.9	79.3					
5 7/8	...	....	55.2	82.8					
6	...	....	57.6	86.4					

Values are given to the nearest tenth. Interpolation is accurate between all values.

Horsepower Rating and Horse Sense.—Empirical formula will avail up to a certain point and within certain explored limits. In a motor, for illustration, the formula will work very well indeed if the bore is within the domain found to conform to the conditions which rendered the formula feasible. It is benerally found that motors of a bore above six inches, and upward, render the use of the formula difficult. Bores below four inches may afford a divergence of power.

HOW ONE MAKER SUPPLIES ARTISTIC LUXURY

SOME two years ago the George N. Pierce Company established an art department whose activities were to be confined almost entirely to the interior decoration of cars and the working out of color schemes.

It was apparent that the time was coming when such a department would be necessary. When the sedan chair was first thought of as a means of transportation, the activities of the makers were concentrated first on making a chair that would be practical and comfortable.

Panels of Pierce Great-Arrow Louis XVI Car.

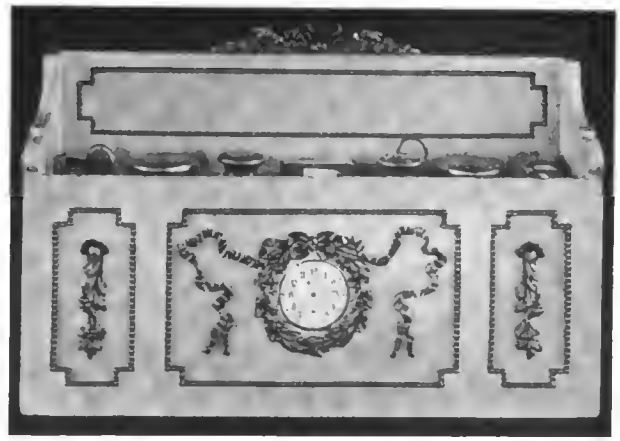
This they accomplished, and then began the period in sedan chair history when the best artists of the time when they were in vogue were engaged to decorate them. The same was true of the great coaches that were used so generally during the latter kingly reigns in France. The

Left Side Decoration of Louis XVI Car.

first coaches were small, unwieldy and uncomfortable. Coach building progressed, however, and when the best methods of construction had been developed the taste of the users turned to their decoration. In both of these instances three epochs marked the progress of the carriages from the first rather bungled affair to the last stage. First came the utility vehicle along, and coincident with it the spread of ideas as to its users. Second came the mechanical perfection of the vehicle, and, lastly, its decoration and appeal not only to the intensely practical, but to the sense of the artistic also.

This, so far, has been the progress of the automobile. As soon as a practical machine had been made, new uses for it were found. Then came the stage when the energies of automobile men in general were centered on the mechanical perfections of the car as a whole. Comfort in the shape of bodies, the fashioning of springs and the depth and quality of upholstery has been made a study, it is true, but these matters, when compared with the possibilities of this new epoch, may also be classed as a part of the refinement of the car from a mechanical standpoint.

Last year visitors at the Garden show will remember a Pierce Arrow enclosed car, finished in Cordovan leather, hand tooled, was displayed. In view of the developments in interior decoration that will be on display at the 1909

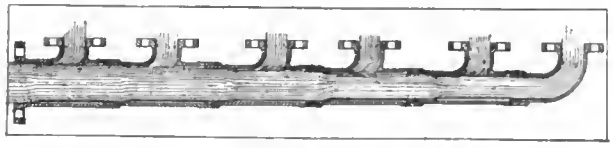


Artistic Toilet Box of Louis XVI Car.

show at the same place, it may well be judged that the designing and display of this car was meant as a test of the reception the public would give this new step in automobile construction. That the reception was one that proved satisfactory in every way is a certainty, since the

Beautiful Ceiling of the Palatial Great-Arrow.

company, this year, will show a far more pretentious product of its art department than the car of the year previous. This is nothing less than a six-cylinder 60-horsepower suburban car, the interior decoration of which is in historically correct Louis XVI style, Herewith is the description from the company:



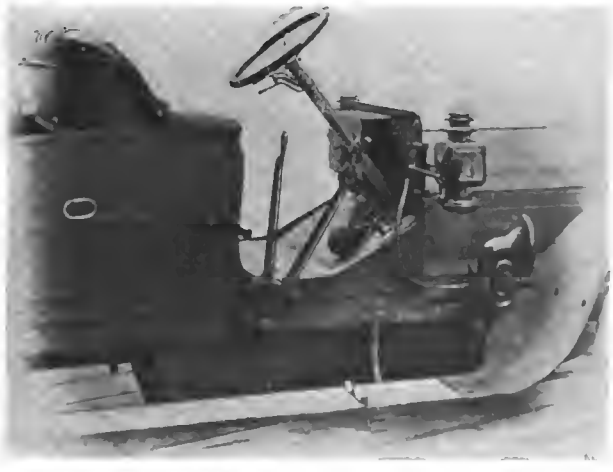
Designer Ferguson's Latest Exhaust Arrangement.

"The outside color scheme of this car is green and gold, forming a fitting encasement for the delicate interior. Satinwood, toned to a soft, golden yellow, has been used for all the exterior woodwork, includnig the dashboxes, steering wheel and the roof of the chauffeur's deck. The roof of this deck is said to be one of the most perfect specimens of this rare wood that has ever been found.

"Beginning with the fitments at the door, one is gradually prepared for the exquisite color plans and metal design that awaits within. The handles of the doors, the outside side lamps, the escutcheon covering the locks, and even the tiny head of the door keys are authentically Louis XVI in design and treatment. All of the metal mounts are in brass, exquisitely chased and heavily gold plated, and finished in the traditional ormolu style. From the dove-gray of the carpet the eye is led upward in a growing crescendo of color and ornament that reaches its climax in the magnificence of the ceiling, with its encircling ornament of ormolu and running design of slender acanthus entwined with garlands of flowers, all painted in the most fascinating colors on a ground of soft gray enamel. The central portion of the ceiling is enriched with an ormolu dome-lamp of the acanthus motif.

"A frieze of separate panels, each one falling just above a window form a pleasing accessory to the ceiling. The center panel of each bears a painted decoration complete in itself, yet united to its companions by the balance of mass and tone, although the motif is changed in every instance, in this manner bearing out both example and tradition of the Louis Seize period. This frieze is borne aloft by a row of slender pilasters that also serve as a separation and guide for the window frames.

"The upholstery is of a silk stripe of gray and yellow enhanced with long garlands of roses through the center of the gray stripe. It extends to the ceiling just back of the rear seat, and forms the decoration for all the lower portion of the car below the line of windows. The under portion of the front panel bears a toilet box, gracefully fashioned and containing a set of dainty toilet articles the designs of which are in keeping with those that might well have graced the houdoir of Marie Antoinette. These also are decorated in pure Louis Seize style and add the final touch to the elaborateness of the detail which goes to make this car a logical and fitting example of the possibilities that will be developed in even the early days of this new epoch on which the automobile industry is just entering."



Illustrating Pierce Adoption of Side Lever Control.

Owing to the fact that the space it could obtain at the Garden was necessarily restricted, another car designed by the art department of the Pierce company will be displayed at the rooms of the Harrolds Motor Car Company, in West Fifty-fourth street. This car is a striking example of the possibility of marquetry work as applied to the interior of the enclosed bodies. It is finished in Circassian walnut, with inlays of colored and stained woods. Taken together the two cars represent almost the two extremes of the possibilities of interior decorations for cars. Between them is a huge field in which the lover of things beautiful might range in his desire to suit the individual taste. In period decoration there is the widest field of all. In the possibilities of marquetry and woods it would be hard to find a limit. This is true, also, of leather. The monks of Cordova with their generations of knowledge left us the secrets of tooling and staining, while the artisans of to-day stand ready to give their Venetian velvets and brocades, full use of which has been taken advantage of in closed body work.

Two Pierce Mechanical Innovations.

Apropos of the mechanical features of the Pierce, it is to note an exhaust manifold herewith illustrated which has the advantage of stability, incidental to the great main principle: the facility of scavenging the motor. This takes advantage of the vortex of an eddying spiral formation in the exhaust as it exudes from the ports and is shaped by means of the walls of the manifold, which are so designed as to set up this spiral formation in the body of the exhaust gases. It is claimed that the power of the motor is increased at least five per cent. by means of this manifold, the shape of which is responsible for the vortex rings.

A glance at the other mechanical illustration discloses the new Pierce control system, which is in full accord with the spirit of the times and takes advantage of the manner in which fine materials may now be fashioned into desirable shapes. This allows of the easy manipulation of the car. The transmission is of the selective genera, and includes four speeds, now regarded as of the greatest importance in a car of the most advanced type of construction.

A. A. A. SCHEDULE FOR SHOW WEEK.

Headquarters will be established by the American Automobile Association in Madison Square Garden during show week, its space being located in Concert Hall, near the executive offices of the show management. These are the meetings which are scheduled during the week:

Wednesday, January 20, 2:30 P. M.—Meeting of the A. A. A. Executive Committee, President William H. Hotchkiss presiding.

Thursday, January 21, 10:30 A. M.—Directors meeting New York State Automobile Association, President Oliver A. Quayle presiding.

Thursday, January 21, 2:30 P. M.—A. A. A. Touring Information Board, Chairman Powell Evans presiding.

Friday, January 22, 10:30 A. M.—A. A. A. Good Roads Board, Chairman C. Gordon Neff presiding.

Friday, January 22, 2:30 P. M.—Conference of A. A. A. Club and State Association Secretaries, National Secretary Frederick H. Elliott presiding.

Saturday, January 23, 10:30 A. M.—A. A. A. Legislative Board, Chairman Charles Thaddeus Terry presiding.

HOW THE CARS ARE LUBRICATED

SEVERAL examples of the sump or crankcase reservoir system exist in the Licensed ranks, among which can be noted Pierce, Knox, Chalmers-Detroit, Palmer & Singer, Columbia, Pope-Toledo, Stearns town car, and others. In two of these, Pierce and P. & S., splash lubrication within the crankcase is not used, the oil being fed direct to all bearing parts and no oil level maintained within the crankcase. In the other examples of sump lubrication the crankcase splash is used in conjunction with the feed to bearing parts. All agree in that the oil is circulated through the motor parts and again recirculated, being filtered once during each cycle.

In the Pierce system the leading characteristic is the oil supply being carried in the sump beneath the crankcase and the crankcase bottom sloped towards the center, so that oil falling in it is immediately drained into the sump. The gear pump driven from the camshaft elevates the oil to a large tank carried well above the cylinder heads, and from this a lead passes direct to each of the crankshaft bearings. From these bearings the oil passes through the drilled crankshaft to the lower bearings of the connecting rods, whence any overflow falls into the crankcase or is thrown into the cylinders in the form of a mist through the slot in the baffle plate, closing the lower end of the cylinder to prevent an excess of oil getting on the walls. This mist not only cares for the cylinder walls, but also oils the wristpin bearing.

It is interesting to note that in connection with the leads from the oil tank to the bearings, that although the interior diameter of the leads are all the same, the oil does not flow through these at the full capacity of the leads, but is regulated by thimbles inserted in the upper ends of the leads where they enter the oil tank, and in each thimble is a small opening which allows only a limited amount of oil flowing. The size of the openings in the thimbles is varied in proportion to the quantity of oil needed, one bearing feeding more than another. In this system a few quarts of oil are poured into the oil tank, if the system is empty, which in tests has proven sufficient for many miles. On the small motors a wide space at the center of the piston is turned down to a slightly less diameter than the body of the piston, which prevents surplus oil reaching the combustion chamber. A paradoxical feature of the Pierce lubrication is the effort made to prevent a surplus of oil getting past the piston into the combustion chamber. First to stop it the baffle plate is used, then the broad groove in the piston and lastly the fact that a splash is not maintained, and consequently a less quantity of oil than ordinary is splashed into the cylinder.

On the Knox Motors.

On the Knox motors is a conventional sump system with the gear oil pump located outside of the sump on a vertical shaft at the right rear and driven by spiral gears from the camshaft with the timer on the top of the shaft. The pump elevates oil into a horizontal passage cored into the top part of the crankcase, and from this are oil leads to each of the three crankshaft bearings. The oil does not overflow from these into the crankcase splash, but first reaches the lower connecting rod bearings and later the wristpins From the crankshaft bearings it is conducted to the lower connecting rods through the drilled crankshaft, which has a radial hole in the main bearing parts which registers once each revolution with the oil lead from the pump. The connecting rods have a 1-4-inch tube running the entire length to the wristpin, the bottom end of this tube registering with the hole in the crankpin, through which the oil escapes from the drilled crankshaft. No oil grooves are employed at the bottom of the piston, but a compression ring is fitted at this part of it. An oil pressure of from two to four pounds, varying with the different models, is used, which is claimed to be sufficient to force the oil to all of the cylinder motor bearings, and the mist from the overflow of which oils the cylinders.

In conjunction with the oil pump system is an adjustable by-pass controlled by spring pressure which maintains the oil pressure at any fixed point between one and six pounds. This by-pass, as well as the leads to the connecting rods, is provided with a small screen, which guards against dirt entering, and a large, fine screen has recently been added in the crankcase base, through which the oil strains before going to the pump. The use of baffle plates in the lower ends of the cylinders prevents an excess of oil reaching the walls.

In the Chalmers-Detroits.

The Chalmers-Detroit "Forty," as well as the "Thirty," employs the sump or crankcase oiling system, the only difference between the two being that in the "Forty" the gear oil pump is driven off the lower end of the timer shaft mounted vertically at the rear end of the motor and in the "Thirty" it is driven off the rear end of the camshaft. In both models the oil is elevated from the sump or reservoir beneath the crankcase through oil leads to the crankshaft bearings, whence it overflows, maintaining a splash in the crankcase proper. In order to insure a goodly quantity of oil reaching the crankshaft bearings, pockets are provided in the case above them which are filled from the splash and from which the oil flows into and through the bearing.

Two schemes are used for oiling the lower connecting rod bearings: First, the connecting rod caps are cut away at the bottom, so that the crankshaft is exposed to oil when the caps dip into the splash; and, second, oil holes are drilled in the connecting rods at the lower ends parallel to the webs, so that the oil which is splashed against them and flows down them enters these holes and is led to the bearing. For lubricating the cylinder walls the splash is relied upon, and oil grooves on the lower ends of the pistons are used. The wristpins in the "Thirty" are lubricated from the cylinder walls, the oil on these running into the end of the hollow wristpin which is anchored to the piston. The wristpin is drilled radially to let the oil into the bearing in the connecting rod. In addition oil holes are drilled on the top of the connecting rod, which are filled from the splash. On the "Forty" the wristpin is gripped in the top of the connecting rod and has a bearing at each end in the piston boss, and to lubricate these the oil from the cylinder wall enters the hollow pin and is led by radial holes to the bearing surfaces. Baffle plates are not used

over the open ends of the cylinders. As a check on the oiling system, all of the lubricant pumped must pass in a constant stream through the sight feed on the dash, visible to the driver, and should this flow cease it is instantly detected.

The Packard system is unique because of its simplicity and individuality. In brief, it consists of two plunger pumps pumping oil by way of sight feeds on the dash to the two crankcase compartments, one to the forward compartment, the other to the rear compartment. These plunger pumps take their oil supply from a vertical cylindrical tank located on the left side of the motor in the open angle between the front and rear cylinder castings, where the oil is maintained at a uniform temperature. The two pump plungers are driven from the camshaft, and have adjustable strokes, permitting of the utmost regulation of the amount passing to each compartment, in which an independent oil level is maintained. In each compartment is a petcock for determining the oil level.

Of the many cars using a mechanical oiler with its bank of pumps, one pump for each oil lead, much diversity exists as to where the oiler should be located and where the oil leads should pass. The old method of carrying the oiler on the dash, where it was at the mercy of the weather to thicken the oil in cold days and thin it on hot days, is almost obsolete. The majority place the oiler on the exhaust side of the motor, some set it on the rear motor arms, and Haynes and Stearns continue, for the second season, their policies of incorporating it in one of the forward motor arms, where it occupies very little room. Last year the Locomobile cars carried it under the floor boards at the left, but this season it is placed under the bonnet.

The Haynes system is typical of this mechanical multi-feed oiler class. The five-feed mechanical oiler mechanism is set in a case in the right front motor arm and the left front motor arm is an additional oil well from which the oil flows through a duct cored in the crankcase to the oiler reservoir. Four oiler leads go to the cylinders and the fifth to the crankcase, the four to the cylinders delivering the oil directly against the pistons.

The mechanical oiler in the Franklin motor has separate leads to the crankcase compartments, in which are small oil pockets beneath each connecting rod, in which an oil level is maintained. The crankshaft bearings, lower connecting rod bearings and wristpin bearings, as well as the cylinder walls, are all oiled by splash. The crankshaft is not drilled, oil grooves are cut in the pistons, but baffle plates are used on the open ends of the cylinders to avoid too much oil splashing in them.

In the Peerless cars the oil reservoir is incorporated in the crankcase, at the back side. The oil is pumped from the reservoir, through four sight feeds on the dash, and thence to the four cylinders. In the four-cylinder motors the crankcase has two compartments and three in the six. In addition to this mechanical oiler, a hand pump is arranged whereby the oil can be injected direct into the crankcase compartment. The crankshafts are not drilled, but oil grooves are cut in the pistons, and by the use of hollow wristpins the oil fed to the cylinders finds its way to this pin through the piston bearings.

In the Stevens-Duryea motors the multi-feed and mechanical oiler is carried under the bonnet, and the leads run direct to the motor parts. The internal lubrication of the motor is by splash, the crankshaft not being drilled, but a compression ring is used at the bottom of the piston, whereas, the regular compression rings are located at the head of the piston above the wristpin.

In the Locomobile motors, the mechanical oiler is located under the hood, and feeds direct to the motor parts. The main bearings of the crankshaft are fed from oil pockets filled by the splash, the ten bearings of the two camshafts are similarly oiled, and the lower connecting rod bearings get their quota of lubricant through the drilled crankshaft. Oil grooves are not cut in the piston, baffle plates are not made use of, and the wristpin is oiled through a horizontal groove cut in each cylinder near the bottom. This groove is always well filled from the splash, and when the piston reaches the bottom of the stroke, the oil in the groove enters the hollow wristpin at each end, and by the usual drilled holes reaches the bearing.

In the two-cycle Elmores the mechanical oiler forces the oil into the intake in the form of a spray, and the mixture passing through the crank chamber and thence into the combustion chamber lubricates all parts. In addition to this there is an oil lead to each of the crankshaft bearings. A compression ring is used near the bottom of the piston, and the wristpin has a cup in the forging which collects a supply of oil, which enters the bearing. There is also an accumulation of oil in the crankcase and the cap on the connecting rod, which dips into it, is provided with a scoop which gathers the oil.

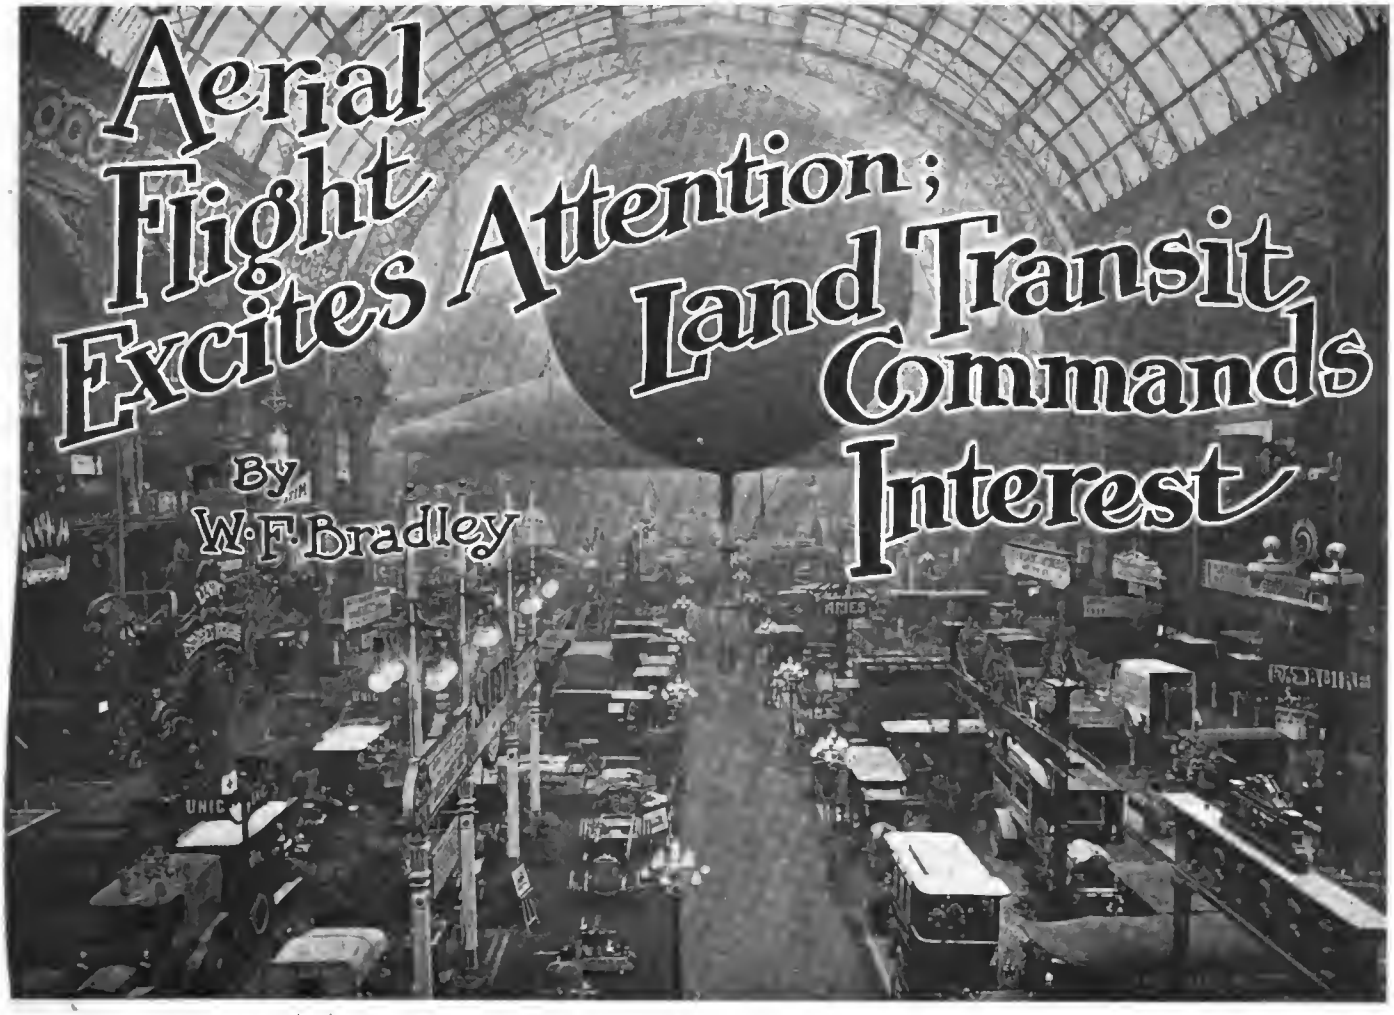
In the White steam cars an oiler is located on the dashboard, which is driven by means of a ratchet from the valve mechanism on the engine. This oiler consists of two independent reservoirs, each supplied with a pump. One of them feeds into the crankcase, and the other into the steam chest. The oil entering the steam chest is carried along by the steam through the engine, being deposited not only on the walls of the two cylinders, but on the valves as well. Any excess oil is carried through into the condenser with the exhaust steam and is returned to the water tank, where it may be fluffed off when filling the tank with water. The crankshaft bearings are of the ball type, and are lubricated by the splash system, as are the crosshead pins.

The Stearns system includes a Lavigne oiler in the front motor arm, from which a separate oil pipe leads to near the base of each cylinder, whether of the four or six type. On the lower ends of the connecting rods are forged lugs which are machined out for an oil lead to force the oil to the crankpin. In addition to this is an oil hole on the top of the bearing, which is filled from splash. The wristpins are oiled solely by the splash system, there being a hole in the top of the connecting rod to collect the splashed oil and a groove along the wristpin to distribute it throughout the length of the bearing. Oil grooves are turned in the piston at the lower end and a compression ring is used near the center of the piston. The crankshafts are not drilled, and baffle plates are not used on the open ends of the cylinders.

Winton six-cylinder motors are lubricated by a double pump scheme, one pump which forces oil to all of the crankshaft bearings as well as to the crankcase compartments, and another pump which again delivers this oil back to the tank from which it was first drawn, thus permitting of the circulation and recirculation of the oil with the usual filtering between successive circuits. The main oil reservoir is located on the left side of the motor base. A double-acting plunger pump draws oil from this tank and delivers it through leads to the four bearings of the crankshaft and the three cylinder compartments. The surplus from these bearings falls into the splash, which, instead of being allowed to increase, is drained off by a collector tube to a oil well, from which it is drawn by the pump and returned to the tank. With this system the crankcase is comparatively dry, the lower connecting rod bearings are oiled by drilling the crankshaft and the cylinder walls and upper wristpins by the splash from the overflow of the connecting rods and what oil may be picked up from the crankcase.

Aerial Flight Excites Attention; Land Transit Commands Interest

By W. F. Bradley

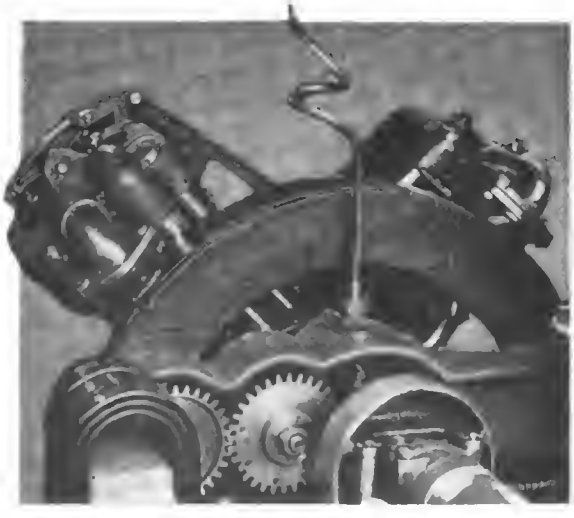


The Second Paris Salon, Wherein the Commercial Vehicles and Aeronautical Exhibits Divided Attention.

PARIS, Jan. 7.—Aeroplanes, although occupying but one-third of the Grand Palais, completely overshadowed the commercial vehicles in the second section of the Paris Salon. Talk of flying is in the air; the crowds came to see the aeroplanes, and came in such numbers that a couple of policemen were needed every day to protect the Wright machine from the mass of sightseers. Round about, where all types of utility automobiles were exposed, there was room and to spare, for trucks and taxicabs were not the subject of the hour.

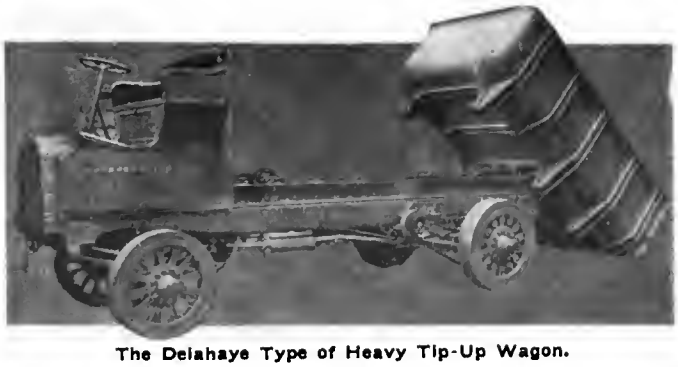
Commercial vehicles have not the charm of novelty, though they are not lacking in interest to those who have taken the trouble to follow such movements. New departures are somewhat rare, and at this time of the day, indeed, it would be rather difficult to get an altogether new system on the market unless it possessed obviously superior qualities. Steam had a lesser representation than ever before, and at the show appeared to be less important than it really is, for Darracq-Serpollet and Purrey, the two most important French firms in this line, were absent from the Salon. There was one newcomer in the Johnson, a French production with British capital behind it, and another one in a steamer for the Renard Trains Company. The only other steam vehicles in the show were shown by the Chaboche Company.

A rotary air-cooled motor using solid blocks of napthaline as fuel was one of the few novelties at the Salon. The motor itself is not entirely new, being a Burlat which has occupied a position on the market for the last two years. The cylinders are disposed in the form of a cross, with pistons connected up to a two-throw crankshaft. For starting up it is necessary to use gasoline, and continue running on it for about ten minutes before switching over to napthaline. During this period the exhaust gases are being led through a pipe forming a jacket round a tube passing through the napthaline tank. At a heat of 176 degrees Fahr. the solid block of napthaline liquefy, the liquid being led down the jacketed tube to the carbureter and treated in practically the same way as gasoline. To carburate it, however, the liquid must be still further heated, and on this account all the intake piping is jacketed to receive the heat of the exhaust gases, napthaline only vaporizing at 302 degrees Fahr. and boiling at about 390 degrees Fahr. When the engine has become sufficiently warmed up to vaporize the liquid, the driver switches over by merely carrying the throttle further round on the sector, one-half of which gives his full range for gasoline, and the other half for running on napthaline. The act of opening out the napthaline supply closes off the gasoline flow.



Burlat Four-Cylinder Rotary Engine.

Lower cost of running is claimed for the napthaline engine, the difference being said to be as great as 60 per cent. The method of converting



The Delahaye Type of Heavy Tip-Up Wagon.

napthaline into a solid block is one that is kept secret by the constructors of the rotary motor. It is declared, however, that the blocks do not consist of pure napthaline, it being possible to incorporate other hydrocarbons with it without any deposit being left. The engine and its special fuel have been produced by the Société des Camions à Moteur Rotatif, of Lyons.

An interesting feature of the truck fitted with a rotary motor was the method of suspension, all the organs, comprising engine, clutch, gearset, and countershaft, being mounted on a subframe attached above the main frame by inverted semi-elliptic springs in front and a single coil spring at the rear. The suspension of the mechanism was thus at all times independent of the main springs, whatever the load carried. Delahaye also made special provision for easy suspension of the motor and transmission on all trucks by employing two sets of springs all round, a lighter set being placed immediately above a much heavier set. When running empty the weight of the vehicle was carried entirely on the upper and lighter springs, the lower and heavier ones only being brought into operation when the vehicle was under load. Experience has shown that a five-ton truck, with sufficiently powerful springs to carry that load, is very destructive of machinery when run light at an increased speed, hence the attempt to give two sets of springs, one for light traveling and one for full load.

Distinctive Type from Switzerland.

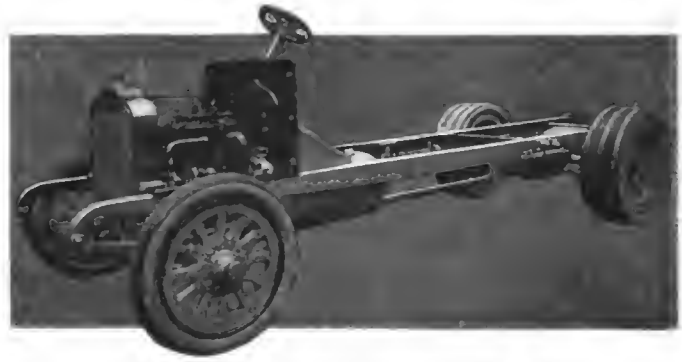
A distinctive type of commercial vehicle was shown by the Stoller Company, of Basle, Switzerland, the motor consisting of a single cylinder horizontal with opposed pistons, connected up to the crankshaft carried below the pistons and in the horizontal plane of the vehicle. The method of connecting is by balance levers and three connecting rods. The combustion chamber is an outstanding port midway in the cylinder, with an exhaust valve in the head and an inlet valve in the base of the chamber. Engine dimensions are 7 4-5 inches diameter by 5 7-10 inches stroke for each piston, the total stroke, of course, being double this. Ignition is obtained by a low tension magneto.

Renault Bus with Michelin Twin and Triple Tires.

The two-cylinder engine being placed across the forward end of the frame, the radiator being to the rear of it, accessibility is perfect. In the forefront of the engine is a horizontal shaft carrying the cam operating mechanism, the gears for driving the lubricator and water pumps, and the governor, all laid bare by removing a single inspection plate with bayonet clasps. Further, the connecting rod ends could be got at by the removal of a plate at each end of the cylinder. From a metal to metal cone clutch the drive is taken to a six-speed gearbox, with gears always in mesh. A feature of this is that the same six forward speeds can be used for the reverse, there being a right and left crown bevel on the countershaft, forward and rear drive being given according to which bevel is slid into mesh. Final drive is taken to the rear wheels by means of side chains.

Speed being the most destructive factor in commercial vehicles, there has been a serious attempt on the part of constructors to make it impossible for drivers to travel above a certain fixed rate. Governors cutting off the gas supply when the engine has reached a determined number of revolutions were a feature of about three-quarters of the heavy vehicles in the show. On the Saurer trucks there are two engine speed limitations, a high one when the vehicle is being run on any of the low gears, and a lower one as soon as the driver slips into top direct drive. When running on the high the driver has only half the gas supply available with the engine in low gear.

Girder frames are a distinctive feature on all the heavier



Chassis of Saurer Four-Cylinder Truck En Bloc.

trucks, this type having the advantage of lower cost compared with the pressed steel frame, and also permitting some very advantageous attachments of the different mechanical organs. There are three distinct types of final drive: by double side chains, by propeller shaft, and by transverse cardan shaft, with internal gearing, on what is generally known as the De Dion principle. Above two-ton loads the chain drive unmistakably holds premier position, experience having shown that the considerable non-suspended weight of a live axle car was not at all conducive to long service. As in the pleasure car class, there has been an abandonment of the low tension magneto for commercial vehicles in favor of the high tension magneto only; in the majority of cases no stand-by in the form of storage batteries is provided.

Two Cylinders Enough for "Taxies."

Taxicab experience is that two cylinders are sufficient, at any rate for the generally fair street conditions of European cities. There are plenty of four-cylinder cabs intended for the heavier work at railroad depots, but for the ordinary city work the only four at the Salon was one exposed by the Fiat Company, with a bore of 3.1 and a stroke of 3.9 inches. The cylinders and upper half of crankcase were produced in one casting. At every other stand the taxicabs on view had two cylinders carried under a bonnet forward, cooled by thermo-syphon circulation, and having high tension magneto for sole electric supply. Among these were Renault, Charron, Panhard, Berliet, Peugeot, Delahaye, Cottin-Desgouttes, Dietrich, and Unic. So convinced are cab companies of both London and Paris of the superiority of the two-cylinder cab that in all cases where both

models have been taken it is the two-cylinder vehicle that is being ordered in increased numbers to the neglect of the four. The principal reason for this choice is the lower fuel cost with the twin-cylinder car, and, in a smaller degree, the decreased cost of upkeep. The objection that anything short of four cylinders was not supple or silent has now been removed.

De Dion goes further and has been very successful in the introduction of single-cylinder taxicabs for London and Paris, the engine being a model with a bore and stroke of 3.9 by 5.1 inches, nominally rated at 10 horsepower. Being remarkably well balanced, there is no more vibration than on the average four, and in city traffic they are not distinguishable by traffic they are not at all noisy.

The Stim Tip Wagon, a Powerful Type of Commercial Vehicle.

Fire Engines Are Many.

Automobile fire engines are a well-developed class, for the authorities in all large European cities have become convinced that better work can be done by the internal combustion motor than by horses. Delahaye showed two distinct types, both of which have been adopted by the City of Paris brigade, which has recently decided to abandon all horses. The smaller engine has as its power plant a four-cylinder motor of 2.9 by 4.3 inches bore and stroke, carried forward and driving to the rear wheels through a three-speed gearset and propeller shaft. This engine, known as the first aid wagon, carries with it 90 gallons of water which can be turned onto the fire immediately the vehicle comes to a standstill, and while connection is being made to the street mains. Including the driver, only five men are needed, and the engine can get away so much quicker and work its way through city streets with so much facility that frequently it extinguishes a fire before the larger outfit gets on the scene. The rule in Paris is to send out the first aid engine when a call is made and let it be followed by the large engine a few minutes later.

On the more powerful Delahaye engine a four-cylinder motor of 5.1 by 5.9 inches bore and stroke was employed, the pump being a Farcot centrifugal type with an ability to draw water from a depth of 30 feet. With 1 1-2 tons of material on board, and fifteen men, the maximum speed on the level is 31 miles an hour. Chassis features were a girder frame, with engine carried forward, four selective speeds and a safety device to prevent slipping in the pump gears accidentally, final drive by side chains. At each extremity of the countershaft, and just within the sprockets, was carried a large size brake drum fitted with radiating flanges for carrying off the heat. The brake bands were of the internal expanding type.

Fiat had a four-cylinder fire engine established to meet the requirements of the Milan brigade, the motor being a 30-40-horsepower model driving to the rear wheels through side chains, and operating the centrifugal pump by means of a single chain geared off the mainshaft. For use in large cities, where a good supply of water could be assured, an engine is constructed with two independent motors, one being used for driving the vehicle, and the second one connected up direct to the pump. Pipe, the Belgian firm, exhibited a four-cylinder engine as used in Brussels.

"Tip" Wagons Produced in Quantity.

Tip wagons, designed for use in the building trade, and for public service works, had been produced in large quantities. One of the most interesting in this class was shown by Delahaye, the metal body being mounted on small wheels running on rails, the ends of which curved downwards at the rear. By means of a low reducing gear the truck could be wheeled out to the end of the rails and necessarily tipped owing to the curve of the rail. The double reducing gear allowed one man to operate the body even when carrying its full load of five tons. The Stim Company showed a wagon of a similar type, in which the body was carried out to the extremity of the rails by means of chain and low gearing, then tipped by a separate lever with a powerful band brake, allowing the movement to be stopped at any position. Rossel showed self-tipping wagons, the body being pivoted so that the rear would always be slightly heavier than the front under load; thus on releasing a pin the load would be dropped out behind, yet the body could be raised to its primitive position by one man.

Heavy city omnibuses have always been found a difficult class

Suburban Type of Bus for Paris, with Pneumatic Shock Absorber.

to fill, the load being great, speed comparatively high, and regularity essential. Of the types suitable for service in Paris and London there were very few examples, the only one really fitted out for this work being an Aries. The Renault Freres exposed a special bus designed for the General Omnibus Company of Paris. It was one of the single deck type, only a small number of which are kept in service in Paris, and although following standard Renault design, is special construction throughout. The frame, a very deep pressed steel channel section type, is adequately strengthened by cross members and angle members at the rear. The engine, a 20-30-horsepower type, is carried forward under the usual Renault bonnet, with plain tube radiator on the dash. Clutch, gearbox and final drive by rear live axle all follow standard design, though naturally very considerably strengthened for their special work.

Instead of being at the right, the driver is placed at the left-hand side of the vehicle, his brake and change speed levers being in the centre. The exhaust carried upwards above the roof of the bus, in the usual City of Paris style, but at the base of the vertical length of piping was a by-pass, allowing the hot gases to be turned into a foot warmer running down the floor of the bus. In place of the solid block tires usually employed on the Paris buses, Michelin pneumatics were used, triples being mounted on the rear and twins on the front wheels.

Plenty of special vehicles were shown for distinctive classes of work. Thus Delahaye had a light disinfecting van employed in the Sarthe district for cases of infectious disease, the work of disinfecting linen, bedding, etc., being done at the door of the patient's house. The same firm had an automobile hearse, with a coupé body immediately behind the driver, and compartment for the coffin at the rear. Berliet showed a special meat wagon which had been used during the last army maneuvers to supply fresh meat to an entire army corps. The chassis was a standard 22-horsepower model on which changes had been made from low to high-tension ignition, and from pump to natural water circulation. The body, a capacious one opening at the rear, was lined with metal, fitted with hooks for hanging meat, and supplied with a ventilator.

For carrying race horses from their stables to the course the Front Drive Latil Company showed one of their models with four-cylinder engine placed across the forward end of the frame, connecting up to the front wheels by means of universals and pinion engaging with internal gear on the road wheels. The absence of machinery at the rear made it possible to fit a low, easily entered body specially designed to accommodate two horses.

Military and city ambulances were plentiful, and although there was a considerable amount of ingenuity in fitting up the interior to the best advantage, the chasses employed in all cases were standard models. On a Gem light delivery van equipped with an engine built under Charles Y. Knight's patents, an attractive advertising scheme was shown in the form of luminous signs on the sides and rear. The body was made with double walls, between the two being electric lamps which lit up the glass signs placed in front of them. The application was easy of attachment to the Gem from the fact that although the motor ran on gasoline the drive was electric. This form of drive is on the increase, although not so much so in Paris as in London. It will be remembered that two such drives were shown at the Salon, Gem and V. A. T. E., the latter showing small cars with a single and two-cylinder engine driving a dynamo, which in turn furnished the necessary power for an electric motor.

This make of Gem was the only one to show the Knight engine, in which the similarity to the Salon was carried still further. This engine, which created such a furore in England previous to the Olympia Show, has attracted very little attention here, the French makers standing aloof from it and regarding it in a good deal the same way as the American, the man from Missouri, who said: "I am from Missouri; you have got to show me."

Bayard-Clement 50-Horsepower Seven-Cylinder Water-Cooled Rotating Engine.

WHAT THE AERONAUTICAL SECTION UNCOVERED

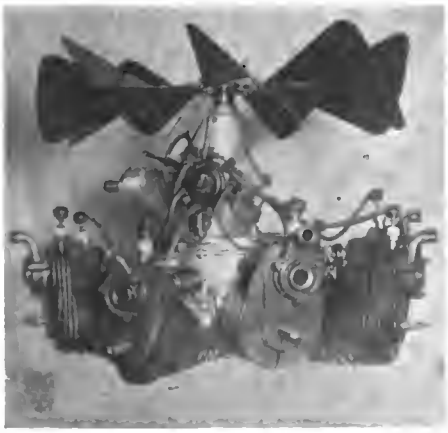
PARIS, Jan. 7.—Nine years ago, when commencing the construction of a man-carrying aeroplane on the lines of a large model which had made successful flights over the Potomac River, Professor Langley appealed to American engineers for a gasoline motor of light weight and low power. One firm undertook the task, but failed so lamentably that a visit had to be made to Europe in the hope of obtaining what was required from the leading automobile constructors. The American specification called for an engine of 12-horsepower weighing not more than 100 pounds complete with cooling water and all accessories. European constructors were asked to produce an engine not exceeding 10 pounds in weight per brake horsepower without fuel or water. They declared the task impossible, and in view of the inability to obtain an engine from established firms, construction was begun at the Smithsonian Institution. The result was a gasoline engine of 52 brake-horsepower, weighing approximately one kilogram per horsepower. European aeronauts met with the same difficulties. After being obliged to design a special steamer for the first flying machine the world ever knew, the Levavasseur compelled to defer his experiments with wings until he had produced an engine light enough.

Wonderful progress has been made since Professor Langley and his engineer visited Europe, there being at least half a dozen firms having engines of less than 10 pounds per horsepower, capable of running with as much regularity as the best of the motors fitted to road vehicles. Most of the work in this direction has been done during the past two years, or indeed during the past twelve months. The year 1908 having proved that the aeroplane is inevitably a means of transport for the near future, scores of constructors have devoted their efforts to the production of a motor suitable for use in the air. It is undoubtedly a wise policy, for already there are a sufficient number of aeroplanes under construction to make the building of light weight motors profitable, and the firm to first get a really successful engine on the market is certain of a handsome reward.

At the aeronautical exhibition there were almost a dozen different makes of aero engines, some of which have been on the market for a couple of years or more, while the majority were entirely newcomers. Roughly, the engines which were presented may be divided into two classes: Eight-cylinder "V" engines, either air or water-cooled, and seven-cylinder engines with pistons of all the cylinders connected up to a one-throw crankshaft. In the former class are Renault, Antoinette, Pipe, and E. N. V., while in the latter should be placed Esnault-Pelterie, the first builder of a successful seven-cylinder aero motor, with Gnome and Bayard-Clement as newcomers.

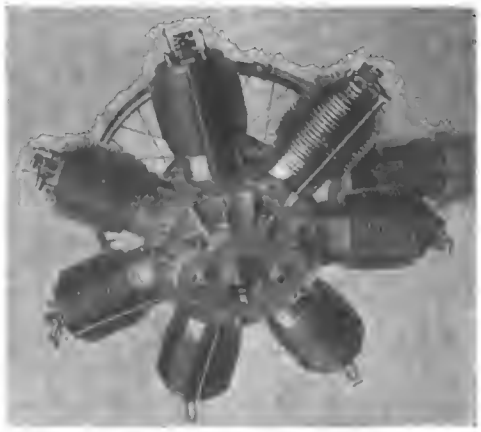
There is no very startling departure in design in any of the eight-cylinder engines. They are invariably built in "V," with two connecting rods linked up to each throw of the crankshaft, and a single camshaft for the entire set of sixteen valves. There is undoubtedly a decrease in weight with an engine built on these lines, for the flywheel can be cut down to a minimum or dispensed with altogether, the crankshaft need be no heavier than for a four-cylinder engine, and there is a saving of one camshaft. To get down to one kilogramme per horsepower, however with a "V" engine of this type is a science of metals, and in more than one case the paring has been carried out to such an extent that reliability of running has faded away.

The Antoinette engine has been too often described to need



Farcot Operates Horizontally.

Cross-Shaped Gobron.



The Rotating Gnome.

Order of Firing Six and Seven-Cylinder Rotating Motors.

repetition. Its successful use by Farman and Delagrange has shown that it can be relied upon, though now that long flights are the order of the day these aeronauts do not put their preference on the specially lightweight model guaranteed not to exceed one kilogramme per horsepower.

Since first produced, the Renault aero engine has undergone several minor changes which have tended toward its greater efficiency. Instead of two fans, one at the front and the other at the rear of the engine, there is now but one, placed on the forward end of the mainshaft, drawing in a current and discharging it at each side of the engine, after passing over all the cylinders.

Pipe Has Ball-Bearing Crankshaft.

An eight-cylinder "V" engine has just been produced by the Pipe Company, of Brussels, the distinctive features of which are a ball-bearing crankshaft; an aluminum casing round each set of cylinders, the forced draught being aspired at the base of the cylinders—the casings are bell-buttomed for this purpose—and discharged at the rear; a combined inlet and exhaust valve, and the use of hemispheric combustion chambers.

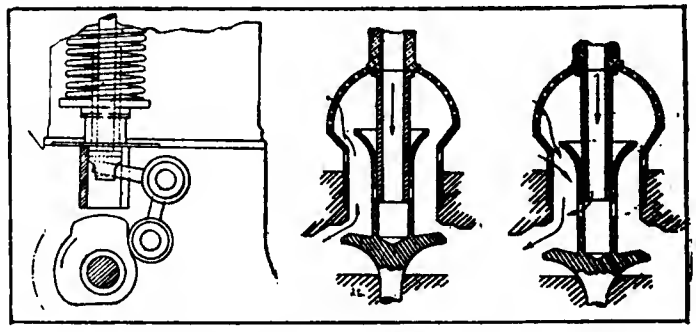
The valves are placed in the head of each cylinder, each valve being operated by two tappets, one operating the inlet and the other the exhaust. The principle is that of a double concentric valve, full details of which are being withheld until all patents are secured. The carbureter, of the ordinary car type, is carried between the two sets of cylinders, with a very neat arrangement of intake piping in the form of a double cross. The engine has a bore and stroke of 3.9 inches, and is declared to develop 70 horsepower, the total weight being 285 pounds.

An electrically deposited copper jacket is the feature which stands out on the E. N. V. eight-cylinder engine, another newcomer to the aeronautical world. Here the cylinders are placed in the usual "V" form, the pistons being connected upon a four-throw, three-bearing crankshaft, there, of course, being two connecting rods to each pin. The cylinders are cast, turned inside and out to as fine a degree as possible, then receive their water jackets by a patented method of copper deposit. The claim made for the system is a perfect union of the copper jacket with the cylinder casting, the joints being absolutely non-expanding. Another feature of the engine is a longitudinal sliding of the camshaft, in order to vary the timing at the will of the driver. A force-feed circulation, by means of a pump driven off the camshaft, is somewhat distinctive of the engine, but in all other respects standard lines are followed.

Gobron Engine Is Not "Standard."

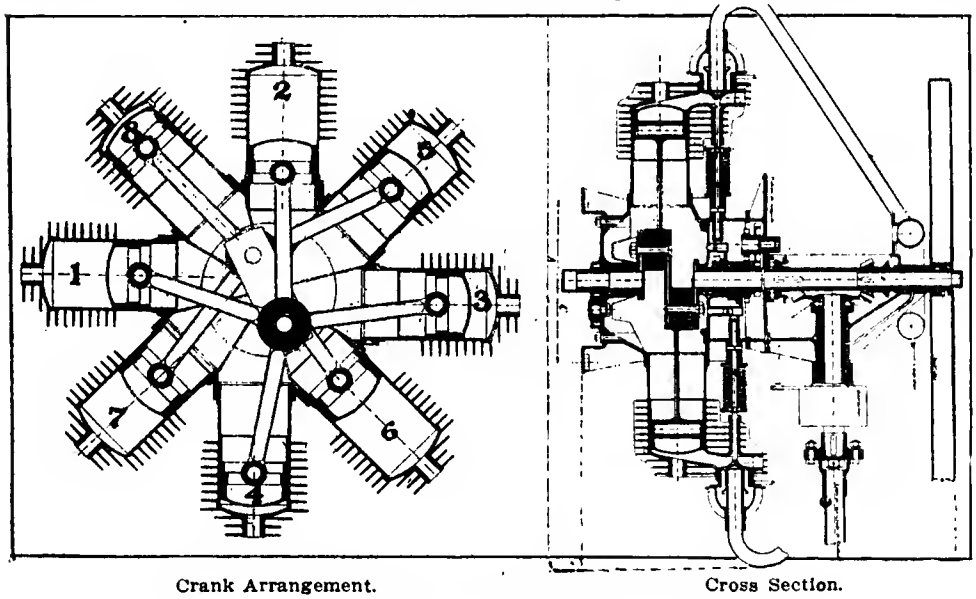
There is little that is standard about the eight-cylinder, sixteen-piston Gobron aeronautical engine which has just been produced. As will be seen from the illustration, the cylinders form an X, and have such an unfamiliar appearance that the newcomer will be puzzled to distinguish between the heads and the base. To understand the motor it should be borne in mind that all Gobron engines have two pistons per cylinder, the heads of which approach one another on the compression stroke and leave one another on the power stroke, the combustion chamber being spaced between the two piston heads. The upper piston is connected to an overhead beam, which in both the car and the aviation motor is common to the pair of cylinders. A long connecting rod links up the overhead beam with the crankshaft, there being, of course, but two of these long connecting rods for a pair of cylinders. The design gives all the advantages of a long-stroke engine without the disadvantage of high lineal speed. The superiority is proved by the fact that for two years Europe refused to admit this type of motor in races against cars with an equal bore.

The designer of the new Gobron has really built a double "V" engine; or, to describe it in other words, two cylinders are mounted vertically on the crankcase; two more are mounted on the under face of the crank-chamber, forming a twin double-opposed engine, and two more are mounted to the left and right of these and at right angles to them, forming either a Maltese



Cam Mechanism. Exhaust. Inlet.

Details of Farcot Combination Valves.

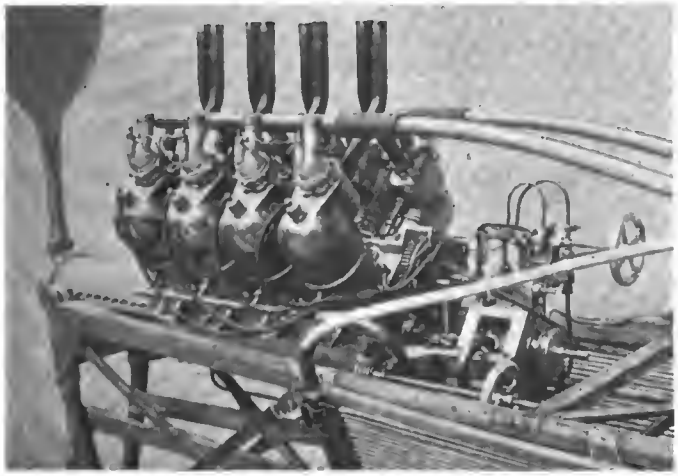


Crank Arrangement. Cross Section.

Air-Cooled Farcot Eight-Cylinder in Detail.

+ or a double "V" according to the way in which the engine is regarded. The sixteen connecting rods are all linked up to a two-throw crankshaft, practically identical with that of the ordinary two-cylinder Gobron. Thus, there is, to begin with, a saving in the weight of the main shaft and an even greater saving in the weight of the crankcase.

The cylinders have a bore of 3 1-2 inches and a total stroke of 6.2 inches, the lower pistons of each set having a slightly longer stroke than the upper ones. The normal engine speed is 1,200 revolutions a minute, at which speed the motor develops 80 horsepower. There is something original in the valve arrangement, the inlets being automatic and placed midway in the combustion chamber, and the exhaust being mechanically operated without the use of any gearing. The inlet is at one side of the cylinder and the exhaust opposite it, the exhausts in one pair of cylinders being operated by a single oscillating beam obtaining its movement from an eccentric working off the crankshaft. The cylinders are a very fine grade of casting and are fitted with copper water jackets. Though nothing has been pared down to a fine degree in the desire to save metal, some very low weights have been obtained. Thus, a complete piston, with its connecting rod and fittings, weighs 11 pounds; the total weight of the

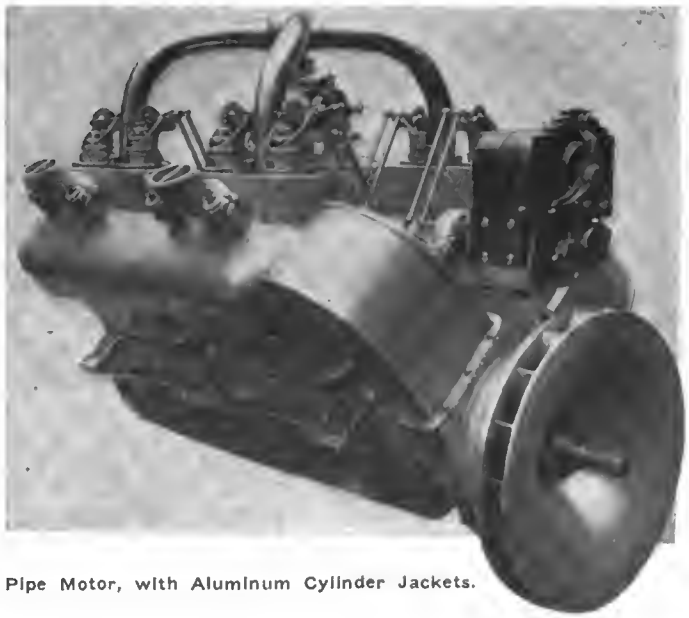


50-Horsepower Antoinette Aeronautical Motor.

crankshaft is 16 pounds. The total weight of the engine, complete with magnetos, carbureter and water, will not exceed 400 pounds, and when properly tuned up will develop 90 horsepower, which is 4 4-10 pounds per horsepower.

Two magnetos are carried on the Gobron, each one being mounted on a platform to the left and right of the crankshaft. It would have been possible to use a single magneto, as is usually done on eight-cylinder engines, but it was preferred to have two in order to have a slower speed of rotation, and in order to give greater security. Each magneto feeds four cylinders in one plane; thus, if one magneto were cut out or broke down, the other would drive the engine as a four-cylinder double opposed. This would give a certain amount of security for aeroplaning, for it would allow the apparatus to be brought back to earth on four cylinders in case of ignition trouble. The magnetos are driven by gearing off the rear extension of the crankshaft, the same gearing being employed for operating the lubricator pump, these two being the entire gears on the engine.

There is less difficulty about the lubrication than might appear at first sight. The oil naturally flows to the heads of the two sets of cylinders, carried head downward, and a pump is employed to carry it up again to the heads of the cylinders that are uppermost, and to the level of the main bearing. An ordinary type of carbureter is employed, without any special branching of the intake piping to reach the four sets of cylinders. It is merely a single length of piping passing successively to each intake. Although the distance that the gas has to travel obviously increases with the length of the piping, it is declared that there is no starving of the cylinders farthest removed from the carbureter. A centrifugal pump, with a capacity of 3-5 of a gallon a minute, takes care of the cooling of the engine.

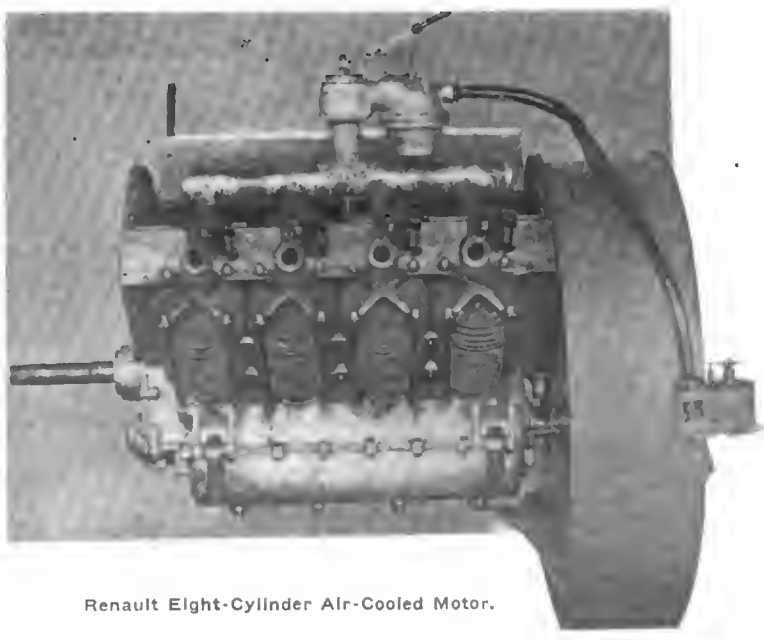


Pipe Motor, with Aluminum Cylinder Jackets.

Horizontal Cylinders on Farcot.

One other French aeronautical motor has been produced in which the pistons are connected up to a two-throw crankshaft, without, however, having any other similarity with the Gobron. On the Farcot engine the cylinders are horizontal, and are placed at equal distances around a circular crankcase; they are slightly staggered in order to allow of connecting up to the two pins of the crankshaft set at an angle of 180 deg. to each other. Bore and stroke of the engines is 4 by 4.7 inches, the engine speed being 1,200 revolutions a minute, and the horsepower 50. Cylinders are cast with radiating flanges and receive a current of air from a horizontal fan mounted on the vertical shaft of the engine. A peculiarity of the order of the firing is that the explosions take place first on all four cylinders attached to one pin, then on the four on the opposite pin.

Though carried in outstanding ports, and operated from below, the valves do not follow standard practice, for each one performs the function of an inlet and exhaust, according to whether it is raised by the smaller or the larger of the two cams for each valve. The exhaust is muffled by a perforated cage around each valve, the passing of flame being prevented by the



Renault Eight-Cylinder Air-Cooled Motor.

The Ader Aeroplane that Resembles a Bat.

use of a fine wire gauze screen. Except for use on a helicoptere it is necessary to employ bevel gear to transmit the power from the vertical shaft to the vertical propellers. The gearing is housed within the crankchamber and advantage is taken of its presence to obtain a reduction in the drive.

Clement Also Has an Aeroplane.

Adolphe Clement, the chief proprietor of the Bayard-Clement factory, and one of the most important constructors in France, has already shown his interest in aerial navigation by the construction of a large dirigible balloon equipped with a powerful racing engine, and now about to be supplied with a huge six-cylinder engine developing 200 horsepower. The same factory has also been studying the aeroplane question for the past twelve months and has just produced both an aeroplane of original design and a special lightweight engine of a very interesting nature. It was estimated that 50 horsepower was required for the ordinary type of aeroplane, and it was this power that M. Clerget, one of the company's engineers, sought to obtain with the lowest possible weight. A seven-cylinder engine was decided upon, all cylinders being connected up to the same pin of the crankshaft, the cylinders were to be water cooled, for it was believed that the slight extra weight of cooling water and pump, etc., would be more than regained by increased efficiency, the main shaft to be vertical, with a bevel gear giving a reduction to the horizontal shaft on which the propeller was mounted.

It is only with a large number of cylinders, six or more, that a sufficiently even torque can be obtained to allow of the abolition of the heavy flywheel. Further, it is only by placing the cylinders around a circular crankcase that it is possible to connect them all up to one point and reduce the length of the crankshaft to the minimum necessary for a single throw. But it is not sufficient to multiply the cylinders, putting six, eight, twelve, etc., in one crankcase, for even this will not always give equally spaced explosions. In the diagram are shown two six-cylinder circular engines, in the first of which the explosions take place in the order 1, 2, 3, 4, 5, 6. At first sight it appears to be an ideal arrangement, for while cylinder 1 is firing, cylinder 2 has completed its compression, cylinder 3 has begun its upward stroke, and cylinder 4 has just begun to discharge the spent gases of the previous explosion. But a second revolution of the crankshaft shows that the arrangement is impossible, for when the cylinders come round to the firing point again each one is empty.

Another arrangement suggests itself: firing the cylinders in pairs, the odd cylinders first and the even numbers afterward. As will be seen from the lines uniting the cylinders in Fig. 2, this would give 1, 3, 5, with equally spaced explosions, then an interval before 2 could take up the firing, followed by 4 and 6 equally spaced, and a quick jump to cylinder 1 again. In either case it would be necessary to use a heavy flywheel to overcome the inertia caused by every second revolution being performed without an explosion, or to overcome the unequal spacing when firing on alternate cylinders.

The only solution is an odd number of cylinders, preferably seven, fired alternately in the order 1, 3, 5, 7, 2, 4, 6, when, as will be seen from the lines on Fig. 3, the explosions are always equidistant, thus giving an evenness of running which makes it possible to dispense with a flywheel. The magneto or storage battery supplying the current is naturally called upon to furnish 3 1-2 sparks per revolution, or seven per two revolutions, of the crankshaft. It is this arrangement which has been adopted on the Bayard-Clement, as well as on the Gnome and Esnault-Pelterie, the only other seven-cylinder engines which have proved a success.

Steel cylinders are employed on the Bayard-Clement, the cylinder walls being 2 1-2 millimeters in thickness and tested to a pressure of 132 pounds per square centimeter, in the hydraulic press, without any deformation taking place. The bore is 3.9 inches and stroke 4.4 The cylinder heads, which are dome-shaped to give a hemispheric combustion chamber, are screwed into the cylinder, then brazed. Valves are in the head, the exhaust housing being integral with the head, the valve being fitted through the port for the inlet before this latter is placed in position. The spark plug is placed between the two valves. Copper jackets, brought up as high as possible to allow of cooling the valves, surround each cylinder.

It had been intended at first to use a pressed steel piston in conjunction with a steel cylinder; but, although no defects were revealed after several months on the testing block, it was feared that a slight inattention or failure of the lubricating system might cause the engine to seize, and the rather heavier cast piston was substituted. Cylinders are attached to the base in the usual manner by bolts and nuts, but the method of connecting the rods is quite distinctive. It is impossible to link up all the connecting rods direct to one pin of the crankshaft, and thus there is provided one main connecting rod attached to the pin, and two auxiliary rods attached to the bearing of the main one; two other pistons have secondary connecting rods, each one of which receives an auxiliary, thus making seven in all.

The crankshaft is in two parts, mounted together, and is carried on ball bearings. No flywheel is used, but within the crankcase are very carefully adjusted balance weights to equalize the mass of material attached to the single pin of the crankshaft. Very great pains have been taken to obtain a perfect balance, two months having been spent by the testing department on this portion of the engine only.

All valve-operating mechanism and timing gears are mounted in the upper portion of the crankcase. The single cam, bearing eight raised surfaces, four of them being for the inlet and four for the exhaust, revolves around the crankshaft, in the same direction as it, but eight times slower. Also on the crankshaft extension is mounted the pinion which drives the vertical spindle carrying the commutator. Within the face of the commutator pinion is a bevel gear driving by means of a short horizontal shaft the high-tension magneto, mounted on a platform cast with the crankcase. In the illustration the commutator spindle and gearing are shown, but the bevel gears for the magneto are not in position.

In the base of the crankshaft is the centrifugal pump, also mounted direct on the crankshaft. A peculiarity of this is the use of seven outlets each one of which is connected up by a short length of rubber hose with the water intake of one of the cylinders. The carbureter, a delicate looking little instrument made entirely of aluminum and weighing complete with float chamber and all fittings, just a fraction over one pound, is carried at the base, but on the outside of the crankchamber. Though having more the appearance of a motorcycle than a high-powered engine carbureter, this one has been tested on standard 50-horsepower cars with excellent results before being fitted to the aero engine. Within the crankcase is a gas receiver from which each cylinder takes its supply of explosive mixture. There are four inlet pipes, three of them supplying a pair of cylinders and one linked up direct to a single cylinder.

With the cylinders carried horizontally lubrication resolves itself into the simple task of supplying a regular flow of fresh oil entering the upper portion of the crankcase. In order to find

its own level it necessarily flows over all the main bearings, and from the crankcase lubricates the cylinder walls and wrist pins by splash. There is no reason to fear an excess of lubricating oil, for the exhaust valves being flush with the cylinder walls, and at the lowest point of the cylinder, any excess which may work itself up to the combustion chamber is swept out unburned. During the six months that the engine has been running on the testing block it has been found that every satisfaction could be obtained from drip-feed lubrication.

The motor illustrated is intended for a special type of aeroplane, and is somewhat distinctive in its reducing gear. Ordinarily, however, the transmission is by means of a bevel pinion mounted on the upper extremity of the engine shaft and attacking a horizontal shaft which is machined out of the solid with its bevel gear. Two-thirds reduction is obtained; and it is worth noting that while all French aeronauts were mounting their propellers direct to the mainshaft, the Clement engineers had decided on a reduction which Wright has since shown to be a valuable factor in the driving of aeroplanes.

Gnome and Clement Engines Similar.

In the number of cylinders, their arrangement around a circular crankcase, the method of attachment to a one-throw ball-bearing crankshaft, and the order of firing, there is a similarity between the Bayard-Clement and the Gnome engine. Instead of the explosion driving down the piston, which in turn causes the crankshaft to revolve, on the Gnome engine the shaft is fixed with the result that it is the cylinders which are obliged to revolve around the shaft.

The entire engine is constructed of the highest grade chrome nickel steel, even the cylinders, with their radiating fins, being machined out of a solid bar of steel. Both front and rear faces of the crankcase are separate, being bolted to the deep ring forming the crankcase proper. Instead of being bolted to their base, each cylinder is forced into the crankcase and held there by a split ring fitting into a groove on the portion of the cylinder passing within the case. The engine has a bore of 110 millimeters and stroke of 120 millimeters, hemispheric combustion chambers with valves in the heads, high compression, and delivers 50 horsepower at a speed of 1,200 revolutions a minute.

Pistons are cast, in order to avoid the use of steel against steel, and although all are connected up to the single-throw crankshaft, there is only one main connecting rod. This is machined out of a solid bar of steel, its lower end being a complete broad face ring bored through at intervals around its face to receive the six other connecting rods, which are attached to the main one by gudgeon pins in much the same way as they are secured to the pistons. Each face of the big bearing is deeply recessed to receive a ball hearing, the connecting rod itself not fitting directly onto the crankpin.

The exhaust valve, as already explained, is in the head and is operated by overhead balanced mechanism. The inlets are automatic and are carried in the piston head, the supply of gas being obtained from an ordinary carbureter, carried in any position. with the intake pipe passing along the hollow crankshaft to the interior of the crankchamber. All valve-operating mechanism and timing gears are contained within the forward end of the crankcase; a collar with an external gear is keyed to the crankcase and drives a sleeve free to revolve on the crankshaft. The ring cams are fitted onto this sleeve, being attached by means of a keyway. The cylinders all being in one plane, it has been necessary to slightly stagger the valve guides and tappets in order that they may be opposite their respective valves mounted one behind the other on a single sleeve.

Double Ignition Is Provided.

Double ignition is provided by storage batteries and high-tension magneto, both plugs being carried in the cylinder head. Lubricating oil arrives to the engine by means of a pipe passing through the hollow crankshaft, the distribution of the oil to all bearings being assured by centrifugal force. Without any excessive paring down of shafts, gears and other material it has been possible to reduce the weight of the engine to 165 pounds complete with carbureter and magneto. Long tests on the block have shown also that the engine can be relied on to maintain the 50 horsepower at which it is nominally rated.

Sixteen Actual Performers Exhibited.

Altogether there were sixteen full-sized aeroplanes exhibited, nearly all of which are machines which have flown or are duplicates of successful machines. In addition to these were a mass of models, doubtless not less than fifty in number, comprising all types of heavier-than-air machines. The point that was necessarily forced upon the visitor was that the aeroplane has already created an industry. The majority of those brought to the show were drawn with the idea of seeing a flying machine and expected to see something freakish that was distinctly in the experimental stage. Instead, they found at least six firms prepared to build machines that will fly, and willing to take payment only when a flight has been made. It is true that at present there are more flying machines than aerial pilots, for there must be at least, in the neighborhood of Paris, three hundred machines fully built or under construction, while those who can fly with them at ease might be counted on the fingers of one hand. Before the second aeronautical show is held, however, all this will be changed.

A number of special motors were shown for aerial work only, the most important of the series being Renault eight-cylinder, air-cooled, Pipe eight-cylinder, air-cooled, E.N.V. and Gordon eight-cylinder, water-cooled, Farcot eight-cylinder, horizontal air-cooled, Rep air-cooled, five and seven-cylinder engines, Antoinette eight and sixteen-cylinder, water-cooled engines, Buchet six-cylinder, air-cooled, and Bayard-Clement seven-cylinder, water-cooled horizontal engine.

I. A. A. CALLS FOR LARGE PRIZE FUND.

LONDON, Jan. 12.—At the meeting of the International Association of Aeronauts here to-day a resolution was presented by President Jacobs, of the Aero Club of Belgium, to the effect that the association should offer prizes to the amount of $240,000 for aeroplanes and dirigible balloons. This amount is to be divided into a number of prizes, providing for a $10,000 gold cup as a special prize for flying machines, and ten prizes of $20,000 each, half of which shall be for dirigible balloons and half for flying machines, besides a $10,000 cup in each department. It is proposed that these ten prizes shall be competed for in ten separate competitions, one to be held every five years. To raise this fund, it is suggested that the United States, Great Britain, Germany and France each contribute $40,000, and Belgium, Spain, Italy and Austria $20,000 each. Of the total, the sum of $20,000 is to be devoted to the construction of portable sheds to house the competing machines.

President Fallières Examining Peiterie Aeroplane.

HOW WILBUR WRIGHT WON THE MICHELIN PRIZE

LE MANS, France, Jan. 1.—The Michelin prize is won, and when Wilbur and Orville Wright sail for America next March they will have in their possession the work of art donated by the French tire king and $4,000 in cash from the same source. It was on the last day of the year that the attempt was made and a new world's flying record put up with 2 hours 18 minutes 33 3-5 seconds, official distance covered 77 miles 760 yards; actual distance about 95 miles.

Early on the morning of December 31 the machine was brought out of its wooden shed to the now dreary plain with its background of fir trees hidden under a thick layer of snow. It was cold, but not so cold as two days before, when Wright had tried to put up a new record and had to give in after 1 hour 52 minutes 40 seconds in the biting air. Some changes had been made to fit the machine for its aerial voyage; an additional gasoline tank had been added; the supply of oil had been increased; the two propeller shafts had been united by a transverse chain in order to keep both propellers running if one of the driving chains broke; finally the machine had been carefully examined to see that all was in good order.

At 11 o'clock a start was made, but after 45 minutes in the air it was discovered that the cock of the new gasoline tank was leaking badly, and a return had to made to earth. An adjournment was made for lunch. In the meantime, Minister of Public Works Barthou, who had traveled down specially from Paris, arrived on the scene and closely examined the homely-looking but wonderful flyer.

Beginning of the Record-Breaking Flight.

Exactly at 2 o'clock the machine was on its rail again; Wilbur Wright, closely enveloped to protect him against the cold, was on the outside seat, the catch was released, the aeroplane jumped ahead, and in a fraction of a second was in the air making for the triangular course marked out according to the rules of the Michelin competition. The triangle was one having two sides measuring 1,093.6 yards and the third side of 218.7 yards, giving a total distance round of 2,405.9 yards. Each of the angles was marked by a flag, and at each turning point a committeeman was stationed to see that the machine kept fully to the outside.

In a second the white bird had reached the first flagpole, and with that peculiar sliding motion that is one of its characteristics, had slipped round with a considerable heel, and was again on an even keel. A straight run of over one thousand yards, then another sharp turn, another straightaway of the same length, then a turn and the short leg of the triangle was entered upon. The aeroplane, indeed, had hardly straightened out before it was in the turn again. All of them were taken with admirable skill, the machine naturally losing ground at each turn, but nevertheless swinging round in a manner that no other aeronaut has been able to imitate.

After a quarter of an hour it became monotonous, for these triangles in the air were performed with so much regularity that one ceased to wonder, and it needed an effort to recall that this man was doing with the utmost naturalness what centuries had dreamed of but never dared to hope for. Half an hour passed, an hour, an hour and a half, and still there was the rattle of the exhaust up aloft and the steady gliding movement of the aeroplane. One hundred kilometers were covered, and the time was noted: 1 hour 52 minutes 15 seconds. Two hours passed and the light began to grow dim, but still he flew on.

"Sunset!" Concluded the Great Triumph.

"Sunset," yelled the timekeeper at 19 minutes past four. Still the artificial bird flew on. But not for long; a few hundred yards more and the engine was stopped, the machine settled down to the earth, and the Michelin prize was won. Fifty-six rounds of the triangle had been made, which at the rate of 2,405.9 yards per round, gave a distance of 76 1-2 miles. To this had to be added 1,203 yards covered after the last passage of the counting point, and the initial 437 yards from the end of the starting rail to the commencement of the triangle, making a total of 77 miles, 760 yards. Making a reasonable allowance for the space lost in three turns per round, and an actual distance of about 95 miles is obtained—the longest flight ever made by any aerial machine of the heavier-than-air type.

Minister of Public Works Barthou rushed forward, and was the first to congratulate the American aeronaut on his splendid performance and the winning of the greatest prize of the year. But there was other work to be done, and hurriedly the apparatus was mounted on the rails, the weights hoisted, the Frenchman invited to take a seat beside the pilot, and they were off in the semi-darkness. The preparations had been too hurried, however, for no sooner had the end of the rail been reached than the big apparatus dropped to the ground. Again it was mounted, again the weights were hoisted, an extra one being added to give a quicker start, and at 5.20 P. M., in complete darkness, the aeroplane and its two passengers rushed off into space. There were a score of automobiles on the edge of the ground, all with their headlights lit, and it was under their glare that the last flight of the old year was made. It only lasted four minutes, but it was evidently enough for the Minister, for on descending he felicited the American pilot more heartily than before.

"It is superhuman how you can remain on the machine for over two hours. I was only up for four minutes and already I am almost frozen. And what a sense of security there is; absolute security."

"Yes," replied Wilbur Wright. "You are safer on my aeroplane than on your railroads."

The health and continued success of the aeronaut were drunk at a gathering at the Aero Club immediately after the afternoon's performance. Minister Barthou was elected an honorary member of the Aero Club of the Sarthe, and, all over, the officials took the train for Paris, while Wilbur Wright made his way to the plain wooden shed on the wild plane, and slept on the rafters with his invention and companion below him.

Both Henry Farman and Moore Brabazon had entered for the Michelin prize on the last day of the year, but neither was able to do anything worth recording. Farman, on the plains near Chalons, flew 1,000 to 1,500 yards on several occasions during the afternoon, but his motor was not properly tuned up and was unable to run steadily for more than a few minutes at a time. Moore Brabazon, on the same ground, endeavored to get into the air, but without success. Finally the attempt was brought to an end by the explosion of the gasoline tank.

Conditions Will Be More Severe for 1909.

In a few days the conditions will be announced for the 1909 Michelin prize, the regulations for which must be drawn up by the Aero Club of France. The conditions for the first year were that the distance should not be less than 20 kilometers, and that the test should be made round a closed circuit in order to facilitate the control. With almost 100 miles having been covered the first year, it looks as if the regulations would have to be entirely modified for the next cup. Although Wright stopped after about two and a half hours aloft, he could have continued for five hours if he had wished to fly until using the last drop of fuel.

The Paris to Clermont-Ferrand trip, which a year ago appeared a chimera, is now thoroughly practical. Had Wright started in a straight line from Paris instead of turning over a drill ground, his record distance would have taken him to Chalons, where his rival Henry Farman was vainly endeavoring to get into the air. Had he gone south, he would have covered half the distance to Clermont-Ferrand. It would not be at all extraordinary, therefore, if next year an attempt were to be made to win the $20,000 for uniting Paris with the Auvergne city 230 miles away.

FOR AMERICAN MAKERS SEEKING FOREIGN MARKETS

By RENE PETARD.

THE present writing has for object to take avail of the activity created by the "show period" to point out the possibilities of the export business to American manufacturers and to review a few considerations to be kept in mind in its creation.

Although America, generally speaking, is one of the world's foremost exporters, its position as an exporter of automobiles is far from being in keeping with its rank of largest producer of these. Complete figures for the year just passed are not yet available; it, however, is easy to surmise that, except as regards trade with other American nations, the 1908 figures will not show over the preceding ones an advance commensurate with the magnitude of the industry. At the close of 1907 the capital invested in the automobile trade was given by the Department of Commerce and Labor as $188,400.00. This investment only resulted in exports outside the American continent amounting to $3,415,459. The enormous discrepancy between these two figures emphasizes the need for action on the part of American makers if they want eventually to avail themselves of all the benefits to be accrued from a prosperous foreign trade.

A few firms which could be counted on less than the fingers of one hand have recognized the inconvenience of this situation. Their efforts, however, were not always equally successful, due in part to lack of sufficient knowledge of the requirements of the markets to be exploited or to the absence of a proper organization. It should also be remembered that the production of such a large country as the United States necessarily is of the most varied order, and that among all the vehicles made it is impossible for every one to be equally suited to the requirements of every market in the world.

The value of the export business is obvious. Besides being a direct source of profits, it is an insurance against over-production, and if properly handled supplies an almost unlimited market (not a dumping ground) for the output which in dull times may exceed the home demand. At any rate, by increasing the quantity of product turned out it cheapens production, a point by no means small in these days of keen competition.

Many makers apparently consider that the remarkably prosperous outlook for 1909 in home sales precludes the necessity of outside efforts for the time being. If it is looked back to the bicycle days, which taught so many lessons to the export trade, it will be at once impressively seen that prosperous days essentially are those during which an outlet must be prepared for the days when the home demand will decrease. Foreign markets will only be ready in dull times in proportion to the work previously expended on them, and the early comers will get the lion's share.

In most centers the situation is highly favorable to the American maker, who, with the trend of improvement, has learned how to produce satisfactory vehicles at a lower price than the foreigner. Nevertheless, a handicap has been created in certain countries by the shipment of machines which, through some defect in workmanship or material, would have been unfit for the home trade. In fact, there now are makes on the American market which have been so widely and so unfavorably advertised abroad in this respect that any amount of expense to reintroduce them would be a dead loss. It is by making it a point to only send out goods rather better than what they supplied to home consumption that English merchants have held their leading rank in the general international trade of the world, and their policy should be universally followed as the only one productive of good results.

To offset the prejudice caused in certain quarters, the American maker will have to supply his product through an active organization prepared to do the missionary work required to restore confidence. Once this result obtained, and it will be easy for a really good machine. The amount of business which will be possible can hardly be realized by one not posted on the buying.

The need for a special organization is further increased by the fact that sales in most markets cannot be made direct from America. The flow of auotmobile buying goes to Europe and mostly to Paris, which accounts for the recent installation of distributing branches in that city by several prominent English and German houses.

One of the great mistakes of American makers in all lines of export has been the useless mailing of never-read printed matter in the English language. If printed matter is at all sent it should always be written in a language commonly understood in the countries where it is sent; French or German will generally better cover continental Europe than would English. In preparing these catalogues close adherence to the American text is not desirable; account has to be taken of the people's habits and ideas, and, often, claims which will very forcibly appeal to the American public will have an entirely opposite effect on the foreign. One instance came to the writer's notice lately in France. The catalogue of a new and remarkable American car was being shown to parties in the trade and independent; in all cases was most favorable comment attracted by the machine, but in all cases also was a part of the catalogue most useful to the American buyer condemned; it was a relation of the foreign machines embodying the same features of design as the machine considered. This was an example of a thing perfect for America, working to an entirely opposed end in another country. Writing a proper catalogue for export can only be done by a man having had actual experience in the lands for which it is intended.

Better than printed matter are traveling salesmen. Sending them from America would be prohibitive, on account of cost, but from a foreign branch they could be sent at a much less expense, both as to salary and traveling cost. The importance of proper representatives in far-away countries is still greater than in the home trade, and incompetent men were often the source of considerable loss in both money and opportunities.

In replying to foreign inquiries, the American maker often boasts of enormous factory outputs. It is right to say that these are in most cases justified, but, however great may the opinion of foreigners be of the activity of this country, they generally lack a basis of comparison to actually realize it, with the result that the inquirer thinks that he is imposed upon, or else, not being educated to the possibilities of quantity production, he concludes that the product made in such large quantities can only be poorly made and badly conditioned. The writer often confronted very deeply rooted opinions to that effect.

In some cases the opportunities for a good trade have been utterly spoiled by the pretensions of some exclusive agent abnormally swelling the prices to increase his profit. This is especially frequent in the Orient. It, then, is well for the manufacturer to provide a fair limit in the selling price, and if necessary to advertise it to a certain extent.

The amount of loyalism to one make which proper treatment can develop in certain buyers is remarkable, and this is very cleverly exploited by German manufacturers, from whom it generally is very difficult to take a customer. This could be turned to advantage by the American manufacturer if he came first to take possession of a trade, distancing his less enterprising competitors.

One feature which greatly hurt the American bicycle export trade was that of the spare parts. If a successful and lasting automobile trade is to be built up it will be necessary to establish at least one depot in the central selling branch. This will be found of considerable assistance in sales.

Advertising in foreign magazines and trade papers outside of the English is of very little use, for, although it is very cheap, it is still too expensive, the Anglo-Saxon being the only European who reads advertisements.

BAY STATE'S GOVERNOR ON ROADS AND AUTO LAWS

BOSTON, Jan. 11.—In his inaugural address Governor Draper devotes much attention to the question of improved State highways and the regulation of automobile traffic. The Governor cites the maintenance of the roads as a serious problem and says that last year it cost $295,000. Referring to the use of the State roads by automobiles, Governor Draper says:

"I believe that their number will increase, and, while this may be a good thing in many directions, they certainly make it much harder to keep the roads in condition, and therefore the annual amount to be expended for keeping the roads good must be materially increased. The Highway Commission estimates that it will require at least $300 per mile per year to maintain the State highways in proper repair. There can be no doubt of the wisdom of maintaining in good condition the splendid property which we have, rather than increasing our mileage rapidly by borrowing money for new construction and allowing the roads to run down because of insufficient expenditures."

Discussing automobile traffic, the Governor says:

"It seems to me obvious that a change ought to be made in the registration fee for automobiles, and that a graded fee should be established, by means of which the people using machines which destroy the roads would be compelled to pay to the commonwealth a proper amount for repairs. I therefore believe and urge that legislation should be enacted which would require the owners of high-powered, heavy and fast running automobiles to pay a greater license fee than is charged to citizens owning lighter and less destructive motor vehicles. Such laws have been enacted in other States, and, in my opinion, are practical and comparatively easy of application. I think, further, that the money raised from such registration fees should be used for the maintenance of State roads."

The Governor favors the construction of State roads so as to connect with the main roads of adjoining States, forming trunk lines. He says that the laws should be amended so as better to regulate the conditions under which automobiles are run, the object to be attained being the prevention of reckless operation. "Speed limits," he says, "may have their advantages, but they oftentimes work a hardship on careful operators. The laws should be so framed that any reckless operation of a motor vehicle, at any speed, should be the test for fine or other punishment, as the case may be. The object to be attained is to frame laws which will prevent reckless and dangerous operation of such vehicles. Where any particular person is convicted, the penalty should be severe; and if glaring cases of recklessness are found, the guilty operator should be prohibited from further opportunity for such action. I would further suggest that some law might be passed which would make it a criminal offense to use an automobile without the owner's permission."

CONNECTICUT'S LAW NOT OUT OF DANGER

HARTFORD, CONN., Jan. 11.—Now that the Connecticut Legislature is about ready to get down to business, autoists in the State are anxiously watching out to see what is going to happen to the present law. One bright lawyer, a member of the Legislature, is credited with being the author of a fool measure to limit the power capability of all gas cars.

The Connecticut Automobile Asociation and the Automobile Club of Hartford will always be represented at the Capitol, not so much as a precautionary measure, but rather that desirable assistance be rendered. It is the consensus of opinion among the legal talent that the present law is adequate, but it should be more strictly enforced. A fixed speed limit is undesirable for many reasons, and to express the matter as set forth by a well-known member of the bar: "A fixed speed limit invites the best of us to violate the law upon opportunity."

Unfortunately, during the past six months there have been several fatal accidents, two of which have happened in this city. For each offense the guilty parties were and are now serving sentence. It is the opinion of one faction that once the adequacy of the present law is made tangible to the Legislature, that its perpetuation will no longer be a matter of question. There are at least a good many supporters of the present law in the Legislature, and of the State officials there is no more hearty supporter than Highway Commissioner MacDonald.

MARYLAND MAY HAVE NEW LAW AND BETTER ROADS

BALTIMORE, Jan. 11.—A bill drafted by Col. Sherlock Swann, of the State Automobile Commission, has been approved by that commission and will be introduced in the next Legislature. The bill will revolutionize the status and standing of automobiles in this State, and will give Maryland, so the commission thinks, one of the best auto laws in the country. The bill is made up of the best features of the laws of twenty other States and also contains many of Col. Swann's ideas. The bill as approved by the commission provides for the annual license of automobiles according to horsepower. At present a license tax of $3 is paid by the owner of an automobile, and that license is good as long as the automobile lasts.

The new law will provide for an annual tax of from $6 to $24, according to the horsepower of the car. These licenses will have to be renewed this year. The bill further provides for the appointment of a special State official to take charge of the automobile law and its execution. A liberal speed limit is to be allowed, and is to be arranged according to cities, towns, suburbs and upon crowded thoroughfares. Streets or roads are divided into three sections—cities, thickly settled and sparsely settled. Speed will be regulated for each of these sections. Heavy penalties are provided for violations of the speed limit. In addition to fines and imprisonment, the licenses may be revoked. The idea is to turn the revenues from the annual licenses, with all automobile fines, over to the Good Roads Commission, and will be expended in repairing and constructing good roads.

Governor Crothers says that these licenses and fines will produce for the State a revenue of from $75,000 to $100.000 annually, and that in ten years this revenue will reach $400,000, basing this calculation upon the rapid rate at which autos are increasing.

Governor Crothers has announced that he favors a second bond issue of $6,000,000 for improved roads in this State, with $2,000,000 of the amount to be used in improving the streets of Baltimore. The Governor figures that this loan, as well as the $5,000,000 granted by the last General Assembly, will not cost the people a cent more of direct taxes. He figures that the proposed increase in automobile taxes and other taxes special taxes will pay for the interest on these bonds.

The Automobile Club of Maryland, through President H. M. Rowe, has announced that it favors the new bill.

AUTOMOBILE ENGINEERS TO HAVE SESSION DURING SHOW

ALTHOUGH a surprisingly large number of the engineers of firms who will only exhibit at Madison Square Garden attended the first session of the fourth annual meeting of the Society of Automobile Engineers, which was held at the Automobile Club of America last Tuesday, the plan of the meeting as originally determined upon last October was to hold a one-day session during the course of each of the shows in New York. The second session will accordingly be held Tuesday, January 19, or on the third day of the show at the Garden. As was the case at the opening session, members will convene at the Automobile Club of America at 10 A. M., where a series of tests of the club's recording dynamometer will be run off by Henry Souther, a member of the society and the chairman of the technical committee of the club. After explaining the workings of the apparatus and the various recording instruments, Mr. Souther will try to run a regular series of tests on the dynamometer, following which the members will adjourn for a discussion of the records thus made. Luncheon will be served at the Automobile Club.

The members will then adjourn to the Engineering Societies Building, in West Thirty-ninth street, near Fifth Avenue, where the technical sessions will be held during the afternoon, convening promptly at 2 P. M. The papers to be read are: "The Economics of Weight Reduction," by F. D. Howe; "An Improved Type of Compression Coupling," by W. S. Noyes; "Standardizing Motor Bearings," by S. P. Wetherill, Jr.; "Some Practical Considerations in Autogenous Welding," by Henry Cave, the author giving a demonstration of the various operations of welding and cutting by means of the oxyacetylene flame, in connection with the presentation of his paper, and "An Indicator with Continuously Rotating Drum," by S. W. Rushmore and H. L. Towle. A general discussion of the points brought out by the author will take place after the reading of each one of the papers.

As autogenous welding, which has already been developed to a considerable extent abroad, is destined to occupy a very important place in automobile construction in the future, and has already made itself invaluable for general automobile repair work, the demonstration to be given by Mr. Cave will be of unusual interest.

Mr. Howe's paper on the "Economics of Weight Reduction" embodies a suggestion that comes as a matter of interest to automobile user and manufacturer alike, and not in the lesser degree to the former by any means. The time has come when the average owner of a car has become tired of transporting useless weight, which simply means that he is burning that much more fuel and oil and wearing out tires that much faster because he has to carry it, and he is going to show the manufacturer sooner or later that it will pay to reduce weights even further than the use of costly materials has already brought them. The improved type of coupling referred to in the paper by W. S. Noyes is known as the Imperial compression coupling, and while it forms a very small part of the construction of an automobile, relatively speaking, the importance of having a coupling that cannot only be depended upon to hold, but that can be taken down readily, is frequently paramount.

The expense of manufacturing the motor would be greatly reduced and the cost of bearing replacements likewise brought down, where the user is concerned, if the practice of using a standard type of bearing for this essential of the car were to be adopted, as advocated by S. P. Wetherill, Jr., in his paper. Motor dimensions have already reached a point where they may be said to closely approach standards in many respects, and in none more than in that of bearings, the differences frequently being very small indeed. One of the most interesting papers to be presented at the meeting is that by S. W. Rushmore and H. L. Towle, on "An Indicator with a Continuously Rotating Drum." The usual method of testing engines has never been entirely satisfactory where the automobile motor was concerned, and while the manograph has represented an important step in this direction, still it is not all that can be desired. Some means of learning what is going on in the motor while it is actually in service on the car, and not merely mounted on a block under test conditions, has always been wanted. Mr. Rushmore has invented an indicator for this purpose, and a large number of its records are shown in connection with the paper, some of them having been taken at speeds ranging from 40 to 50 miles an hour.

Following the reading of the papers and the subsequent discussion, the members will adjourn to the Engineers' Club in West Fortieth street, where the annual dinner of the society is to be held. Visiting automobile engineers who are not members of the society are invited to attend the session. They will be welcomed, and it is hoped they will find the session of interest.

PENNSYLVANIA'S TRANS-STATE HIGHWAY HOPES ARE HIGH

PHILADELPHIA, Jan. 11.—Automobilists here are delighted over the strong indorsement of the trans-State highway given by Governor Stuart in his message to the Legislature at its convening last week. After showing that the Highway Department, since its creation in 1903, had completed 542 miles of roads, with 223 miles under contract—and incidentally strongly disapproving of the present piecemeal system through which "much of the money expended by the State for road improvement will be wasted"—the Governor urged the necessity of a "State system of main highways connecting the several county seats; the county should construct roads connecting important points in the country, and the township system of byroads, leading to the main ones, should be constructed by the township, or by the township and county jointly."

As a beginning of such a system as he outlines, the Governor recommends "the building and maintenance, entirely by the State, of a road to extend from the seaboard to the Ohio valley, between the cities of Philadelphia and Pittsburg, via Harrisburg, the capital. This highway should be in the interest of the greatest number. The route is sufficiently precise as to location to be a decisive and fair plan. The line may be subject to local changes, without avoiding the cardinal objective points. Thus populous centers will be traversed, and important cities and county seats will be connected, representing a county population of more than 50 per cent. of the entire population of the commonwealth. No other line for a main road can be found which would reach so large a proportion of the State's population, or which would serve so many useful purposes. I recommend that the determination of the exact route be placed in the hands of the Highway Commissioner, Attorney-General and Governor."

The advocates of the Juniata Valley route are taking much comfort from the Governor's inclusion of Harrisburg, the State capital, as one of the "cardinal objective points" on the route. If the capital is included it will be much easier, they claim, to continue on through Juniata Valley, via Mifflintown, Lewistown, Huntingdon and Tyrone to Altoona, than to make a long detour to the southwest in order to reach the old post road at Gettysburg or Chambersburg. They also point out that that portion of the Governor's screed which says that "important cities and county-seats will be connected, representing a county population of more than 50 per cent. of the entire population of the commonwealth" cannot possibly refer to the southern route, for not only are there fewer county-seat towns on that route, but the towns, with but few exceptions, are smaller. Besides, by including Harrisburg as one of the "cardinal objective points," the route to the capital via Reading can be selected.

LETTERS INTERESTING AND INSTRUCTIVE

CONSIDERING DIFFERENT BEARINGS.

Editor THE AUTOMOBILE:

[1701.]—I notice that on some of the "big cars" the hubs of the road wheels are quite small, and with some of the runabout types the reverse is true. Does not this indicate a lack of uniformity, or, worse, is it not a fact that some of the cars are without adequate bearings in the road wheels? HARMONY.

New York City.

It is well to observe, it is even better to think, but is best to think twice. The weight of a car does not serve as the sole criterion in determining as to the proper sizes of bearings to use in the wheel hubs. The weight of a car does serve to fix upon the static responsibility. In a kinetic sense the question is one involving the speed of the car, on the one hand, and the ability of the tires, on the other. For a given speed, the car with the largest pneumatic tires is the car that will allow of the use of the smallest bearings, in point of actual ability. Considering the same (given) speed, it is even permissible to use smaller bearings on a big car, so called (if large tires are used) than might be used on a runabout, with smaller sized tires. It is the shock that is to be feared, and it is the large tires that abort shock. By large tires is meant tires large in proportion to the load. Then there is the relative value of the several types of bearings to be considered. For a given rating, all the bearings do not occupy the same amount of space. This in itself will make a difference in the external appearance. Finally, there is no better illustration of the point to be made than to repeat the statements of Henry Hess in relation to the effect of different tires on the sizes of bearings to use, referring specifically to "H-B" bearings. The relations were put as follows:

(a) With pneumatic tires..... 100
(b) With solid tires..... 75
(c) With steel tires..... 60

In other words, it is to say the ball bearings that would do for a case involving pneumatic tires, under suitably regulated conditions, would be 25 per cent. below the requirements with solid rubber tires and 40 per cent. short in the cases in which steel tires are considered. In this statement no account is taken of what would be the case were it possible to maintain the same speed with the several tires. As a matter of fact, the speed would be lower for the solid tires than would be the allowable speed with the pneumatic tires, and, again, the speed with the steel tires would be still lower.

NOTHING THAT SHOULD GO IN AN AUTOMOBILE.

Editor THE AUTOMOBILE:

[1702.]—Please decide a dispute in your "Letters Interesting and Instructive" regarding a brake system, which I have designed, by stating whether or not the 4-inch levers of the equalizer are to be considered as intermediaries and therefore do not either increase or decrease the pull of 96 pounds from each wheel on the 6-inch bellcrank lever. Also kindly state the pressure on the in-pounds required on the foot pedal. MISSOURI.

The pull of 90 pounds exerted on the brakerod and transmitted to the equalizer bar will still be 90 pounds, if it is true that two 4-inch levers are placed 180 degrees apart on the shaft. There would be no difference in time or pressure at the end of two levers so placed. No amount of pressure on the foot pedal would give you any result at all, because the mechanical motions do not seem to be true. The lever on the pedal shaft will rotate away from the bellcrank on the second shaft, and you do not show a means of taking care of the difference.

Your drawing does not express your idea clear as it should be expressed, in order to have it understood by others, and it is possible that you do not contemplate the use of a lever system such as this. At all events, it does seem as if the scheme is half baked and far too crude to be discussed as a brake system in work of the character involving automobiles.

TWISTING MOMENT IN LIVE REAR AXLES.

Editor THE AUTOMOBILE:

[1703.]—Every time I take off the hub cap of my car I am impressed with the smallness of the "jack-shaft," if such it may be called, and the largeness of the load. Instead of worrying about it for a year and a day, it is my purpose to have you tell me if the present practice is safe; if, in fine, a 1 1-4-inch shaft is suitable for the purpose. My car weighs about 3,000 pounds, will do about 45 miles per hour, and I would think about 60 per cent. of the load is on the rear axle. The wheels are fitted with 36-inch tires. Of the material in the jackshaft, I know little or nothing; the power, on the whole, it is very satisfactory, and this should indicate the use of fair material in the shaft. P. B. P.

Ogdensburg, N. Y.

Let,

d = diameter of the shaft in inches;
R = radius of the road wheel in inches;
f = coefficient of friction between tire and roadbed;
w = weight in pounds on one wheel;
S = allowable extreme fiber strain in the material;

when,

$$d = \left\{ \frac{R\,f\,w}{S} \right\}^{\frac{1}{3}}$$

For the case in point it is to say,

$$d = \left\{ \frac{18 \times 0.60 \times 900}{16{,}000} \right\}^{\frac{1}{3}}$$

= 7-8 inch, nearly; taking the next above fraction of convenience.

This is on a basis of 16,000 pounds per square inch of fiber strain, which is not excessive, considering good steel. As will be seen, then, the shaft is not too small, from the torsional point of view.

You failed to give information in relation to the bending moments. In other words, if the shaft overhangs the bearings the result will be by way of bending moments that will have to be taken into account ere it will be possible to say to what extent a factor of safety resides in the shaft in question. It is not uncommon to find an overhang of 2 inches, and on this basis it will be possible to ascertain what the effect will be; proceeding as follows,

Twisting moment in inch pounds = $18 \times 0.60 \times 900 = 9{,}720$;

Bending moment in inch pounds = $2 \times 900 = 1{,}800$;

combining,

$$1{,}800 + (1{,}800^2 + 9{,}700^2)^{\frac{1}{2}} = 11{,}666, \text{ nearly};$$

and,

$$D = \left\{ \frac{11{,}666}{16{,}000} \right\}^{\frac{1}{3}}$$

= 15-16 inch, approximately; taking the next up 1-16 inch as a desirable figure:

in which,

D = the diameter of the required shaft, on a basis of bending and torsional moments combined.

The required size of the shaft is still less than the size actually used in the car. The reason for this lies in the fact that "keying" reduces the strength of the shaft and, as a result, must be taken into account. Since the depth of the key is no more than the difference, it is reasonable to assume that the diameter of the shaft was made as much more than the size as dictated by theory, as is represented by the depth of the key in the shaft. This investigation is a little at odds, due to lack of data. The overhang may not be quite 2 inches; the weight may not be exactly as assumed; the shaft may be alloy steel, in which event the fiber strain taken is low; in fine, it is necessary in practice to consider all the influences.

In any case it will be well to guard against too much accuracy in a situation such as this, on the ground that the material to use must depend upon experience rather than some preconceived notion of the mission that "jewelry steel" may have to perform

in this world of much uncertainty. If experience in your case is such as to lend confidence, you will be justified in accepting the figures as above given, rather with the hope that they reflect the state of the case with fair accuracy. On the other hand, it is right to say the designer of the car, at the time of designing the jack-shaft, had far more chance of fixing upon suitable dimensions of the shaft than can one, at a distance, in the absence of exact data.

WHAT TO DO WITH A WHITE ELEPHANT.

Editor THE AUTOMOBILE:

[1704.]—I have a single-cylinder car of a well-known make, four years old. I have lengthened out wheelbase, made body side entrance, and practically everything is up to date but the power, this being the only next thing human nature rebels against now. Getting a new car and trading this one is out of the question—first, because one gets nothing for the old one, and, second, because I can't afford it. How would it do to put on, say, half-inch bigger bore cylinder? The present one is 5 by 5 inches. Would you advise using the same size intake and exhaust valves and carbureter? How much more power in your estimation would I gain by such a move? HARRY J. SWOLE.

Ansonia, Conn.

The only best way to increase the effectiveness of your motor lies in the direction of the alteration of the gear ratio in favor of the motor. The next best scheme is to use a flywheel of greater effectiveness; in addition to these expedients, you can very well afford to see to the carbureter, improve the ignition and look out for the compression. Nothing is to be gained by altering the sizes of the valves if they are of a fair size now. The fact that they may or may not be of the same size is of small concern.

THE VENTURI PRINCIPLE IN CARBURETERS.

Editor THE AUTOMOBILE:

[1705.]—The Venturi tube must have some especial value in carbureters because it is used; that is to say, the principle, in quite a number of them, and it is not far from right to say that it is in "good" carbureters that the method is exploited. Without going into mathematical detail, will you please state the real reason why the shape conforming to the Venturi principle is of value in this class of work? 1-80,000,000.

New York City.

The "Venturi" tube will be approximated if two hollow truncated cones are brought into such relation that the small ends will meet. When this principle is properly incorporated into a carbureter the suction pressure on the gasoline through the nozzle is constant, or more nearly so than will be possible in any other way as yet tried out, in so far as is generally known. Considering the Venturi tube, there is a point in the progress of the suction when the pressure ceases to increase, and as a result the flow of gasoline is in proportion to the requirements rather than in excess at high speeds.

WOULD MAKE A TWO-PLY CRANK OUT OF YOU.

Editor THE AUTOMOBILE:

[1706.]—What would be the effect if a spray of water was forced into a gas engine cylinder before the explosion or combustion of the gas? A CRANK.

Buffalo, N. Y.

Water in the cylinder would upset the mixture, which is never so good as to stand the change and leave the motor in a state fit to talk about. It is a fact, however, that the right amount of water under well regulated conditions would "tend" to fatten the curve of expansion, and theorists dream about it. On the other hand, when the "octopus" delivers gasoline with even a little water in it, the water is not carefully separated out, trouble is spelled with a capital T.

WANTS REPAIR PARTS FOR THE DRAGON CAR.

Editor THE AUTOMOBILE:

[1707.]—I have written several letters to the Dragon Automobile Company, at Philadelphia, but have failed to receive any reply from them, neither have my letters returned. Do you know if any one is to continue the manufacture of the Dragon cars? Can you tell me where to secure repairs for the different parts of this car, such as the engine, transmission, rear axle, etc.? I would like to secure some repairs for this machine when I overhaul it this Winter. My car has run 12,000 miles, with absolutely no repairs, no adjustment ever taken up on the engine, and no trouble except tire troubles. It is certainly the best car for the money I ever saw. And it is a pity that the company does not continue to build them.

Lafayette, O. H. P. M.

It is understood that the manufacture of this car has been discontinued. However, if you will write to Yardsley, Levene & Co., Philadelphia, you can doubtless obtain a supply of repair parts such as you desire.

ABOUT THE RESILVERING OF LENS MIRRORS.

Editor THE AUTOMOBILE:

[1708.]—Will you please tell in "Letters Interesting and Instructive" how to resilver lens mirrors, as the silver backing of the lenses of my headlights has all disappeared, due to their getting too hot? R. H. COOLEY.

Oakland, Cal.

We think the best advice to give you is to recommend returning the lenses to the maker of the headlights, or to some local firm which has facilities for doing this work, as the usual amateur job of this kind calls for an investment in materials and time that is seldom compensated for by the results.

CAN TIRES BE RUN SAFELY WITHOUT CLIPS?

Editor THE AUTOMOBILE:

[1709.]—I find that my tires give much trouble, possibly on account of the weight of my car, and in changing time is taken because the "clips" have to be undone, and the threads of the same become more imperfect every day. Would it be safe to dispense with them? OWNER.

Brooklyn, N. Y.

Some owners of cars do eliminate the tire clips of the front tires, and once in a while the rear tires are so treated. It cannot be said that the idea is a good one, since it is possible for the tires to come off, and in the act do much damage. Tiremakers are competent to decide as to the requirements as a rule, and to comply with their ideas is usually well within the bounds of good practice. If the tires on your car are small for the weight, it is within the bounds of reason to consider an increase.

ANTICIPATING THE SUCCESSFUL AEROPLANE.

Editor THE AUTOMOBILE:

[1710.]—Some time ago while reading "When the Sleeper Wakes," by H. E. Wells, I was struck with the description of the flying machines used by the people of his imagination. For example, he says (Chapter XVI):

"The aeroplanes flew safely only in a calm and moderate wind. . . . The starting of the mechanism was only possible from a gigantic car on the rail of a specially constructed stage."

These aeroplanes were very large and went from London to Paris in 45 minutes. They required similar stages for landing. The aeroplies were smaller, carrying two persons. Note the description, written about 1895:

"Their sails (planes), which were brilliantly colored, consisted only of two pairs of lateral air floats (planes), in the same plane and of a screw behind. Their small size rendered a descent in any open space neither difficult nor disagreeable, and it was possible to attach pneumatic wheels or even the ordinary motors for terrestrial traffic to them, and so carry them to a convenient starting place. They required a special sort of swift car to throw them into the air. Its lateral supporting sails were braced and stayed with metal nerves, almost like the nerves of a bee's wing, and were made of some glassy artificial membrane. The engine was very simple in appearance . . . ; it was of the explosive type, burning a small drop of a substance called 'fomite' at each stroke."

Evidently injection feed. His first sensation was of fear, but this soon changed to desire to stay up indefinitely. Further:

"Steering was accomplished by the opening or closing of one or two thin strips in one or the other of the otherwise rigid wings . . . . During these downward glides the propeller was inactive altogether."

In the arrangement of the planes, the starting mechanism and the pneumatically tired landing wheels he seems to have anticipated some of the latest successful machines. E. T. BIRDSALL.

Rochester, N. Y.

TRUTH EMANATES FROM THE LABORATORY

Appearances do not tell the tale of the qualities residing in materials, and the conventional methods of arriving at the approximate situation are so misleading, in many cases, as to demand that they be used but sparingly. On the other hand, it is rarely that the vendors of materials, especially steel, condescend to enlighten the users sufficiently for the purpose on a basis of safety. It is not to be supposed that the fabricators of steel do not know just about what the materials are good for, nor will it be beneficial to set up the contention that they deem it inexpedient to lay bare the situation.

Whatever may be the situation from the fabricators' point of view, the fact still remains that the users of materials should look out for themselves; for the law says, "the purchaser must look out for himself." Under the circumstances, it is not unbecoming in any user of steel to take up the burden, and, even if the process is of a length and to a depth, give it the benefit of most careful consideration. Because there are phases of the problem that do assume a mysterious form, there is all the more reason why the user of materials should take hold and by a systematic method of procedure arrive at the bottom facts, instead of groping in the dark.

To approach the subject in due form is the only way by which knowledge of the facts will come to light. Due form, in this case, demands that the user of materials shall step out for himself, taking into account pyramided knowledge, the requisite facilities, and a firm resolve to unswervingly advance in the face of every delinquency. That difficulty will beset the onward march, is assured, but the password will be given to all who are worthy, if they persist.

The password, if the maker of automobiles is to be considered, is bound up in a laboratory. It is in the laboratory that the qualities of the materials can be arrived at, and as a result of the investigations there to be conducted the dross will float to the top, ready to be skimmed off. So far, much of the dross has been floated, many things were rendered clear, and the potency of the process is now so self-evident as to be declared a "naked truth."

* * *

THE SOCIETY OF AUTOMOBILE ENGINEERS

When an organization springs into being—spontaneously as it were—and in the course of a few years grows to an extent where it begins to make its influence felt, it may be said with reason that its existence is the outcome of a natural demand. This has been the case with the Society of Automobile Engineers, which is now entering upon its fourth year. Trade associations were quick to realize the great value of cooperation and a mutual interchange of ideas upon subjects of common interest to a number of engineers, but what the industry at large needed was a body whose deliberations were open to all, and the benefits of which could be equally shared by every maker of automobiles.

Experience in other fields of engineering endeavor has shown the necessity for independent investigation, unhampered by trade affiliations, and the great success of the independent engineering organizations that are the outgrowth of more than a quarter century of development, shows that they have met a demand not to be answered in any other way. Exactly the same conditions apply in the automobile field, and it was this need that prompted half a dozen well-known engineers to broach the matter of forming an organization. The result is the Society of Automobile Engineers. Starting with a few charter members in 1905 it now numbers close to 300, and includes in its ranks engineers drawn from every branch of the industry. Its increasing strength tells a story complete in itself. At the end of another year it will be interesting to note the progress made.

* * *

THE NEXT PHASE IS CLOSE AT HAND

Judging from the news that comes from Paris the next phase is near at hand. While it is a certainty that aerial travel will never have any substantial effect upon automobiling in general, it is pretty good guessing that many automobilists will also add aerial skill to their accomplishments.

It was in France that the automobile had its earliest and most rapid progress, and though an American has shown the Frenchmen how to fly, he did so because there was more encouragement offered to him on the other side of the ocean than in his own country. Furthermore, the Frenchmen are taking to aeronautics as readily as a duck does to water, and the first aeronautical exhibition makes apparent the fact that there is going to be no small amount of attention devoted to the aerial problem until it becomes as common as automobiling is to-day.

GIST OF MAKERS' TARIFF BRIEF TO CONGRESS

SIGNED jointly by Henry B. Joy, as chairman of the tariff committee of the Association of Licensed Automobile Manufacturers, and Benjamin Briscoe, as chairman of the committee of management of the American Motor Car Manufacturers' Association, the supplemental brief of the American manufacturers of automobiles expressing them in favor of a protective duty, has been filed with Congressman Sereno E. Payne, chairman of the House Committee on Ways and Means at Washington, and has also been generously distributed throughout the entire country. Pertinent extracts from the brief are herewith given:

The number of people directly employed in motor-car factories is upward of 100,000, and the number of others employed in the allied industries is being compiled for your committee.

The number of establishments allied with this industry and more or less dependent upon their success is approximately 4,000.

Foreign manufacturers are protected in their patent rights in America, while American manufacturers must manufacture abroad in order to retain their foreign patent rights.

The price of labor in America is two and one-half times as much as it is in Europe, and the cost of selling in America is one and one-half times as much as it is Europe, while the cost of technical employees is twice as much here as in Europe. We do not at this time enumerate the difference in the cost of material, advertising, rents, insurance, or all overhead charges.

If the tariff is to be primarily adjusted at the difference between wages paid here and abroad, then the tariff should be 60 per cent. instead of 45 per cent. This is not the desire of your petitioners. We seek to have automobiles specified as such in the tariff bill itself, and not governed as now by a tentative ruling of the Treasury Department. While the present duty of 45 per cent. may not be a sufficient protection as time goes on and trade conditions change, still the industry itself should by its own strength be able to meet these emergencies. As a matter of fact, the industry is still in such a condition of early growth that final figures can not be made absolute on an exact rate of full protection in the tariff.

The fact of overproduction and the alarming commercial conditions prevailing at present in this industry abroad is shown in the reports from the automobile shows in London and Paris in the various foreign trade publications.

Individuals are allowed to import a single machine purchased abroad and to bring it in under section 19, when the law is clearly defined on actual purchases under sections 3 and 4. This alone has made a difference in revenue to the Government of over $200,000, and given to the foreign manufacturer an unfair advantage over the American manufacturer and dealer.

What the Treasury Ruling Now Permits.

The report then goes on to say that a treasury ruling permits an examiner to place a value upon machines used for a period of less than a year abroad, and it is suggested that some arbitrary rule be adopted, governed by the length of ownership, number of miles traveled, condition of the vehicle, or all three.

Especial attention is called to the evasions of regulations T. D., 23,743 and 26,162, by false representation of alleged racing and touring cars. Cars are claimed to be regularly imported, exposed for show purposes, and sold. Under these regulations an importer is enabled to expose for sale imported racing or touring cars for three months after importation without the payment of duty. The only penalty provided is the payment of the duty or the exportation of cars.

A 40-horsepower Fiat car, made in Turin, Italy, is now entered at the port of New York at 8,000 francs net, and 150 cars of this make have been imported, consigned to an Italian banker. The close alliance existing between this banker and the Fiat Automobile Company of New York is deducible from a letter from the latter to the Mayor of Detroit, dated December 21, 1908, in which it is said that a large factory may be established in this country.

"The foregoing automobile is offered for sale in this country at $6,000, with body and equipment, and $5,000 for the chassis alone," states the brief. "Agents receive a discount of 20 per cent. from the last price, leaving a net selling figure of $4,000 and a profit of $1,600, less a trifling cost of mudguards and running boards. The importer has this margin with which to undersell American competitors.

"Similarly the Lancia car, made in Italy, is offered for sale in France, England and Italy for $2,000, and after adding 45 per cent. duty and 5 per cent. import charges, is offered in this country, similarly equipped, for $1,800—or $200 less than its parallel selling price abroad."

Aggregate Value of Imported Vehicles Reduced.

Following is quoted entire from the brief:

In view of the fact that the aggregate value of imported vehicles between 1906 and 1908 has been reduced almost 50 per cent., and between 1907 and 1908, 26 per cent., and the average value per vehicle for a corresponding period shows a respective reduction of 40 per cent. and 30 per cent., we urge upon your committee the imperative necessity of such provisions in the interpretation of the words "market value" as will entail the requirement of certain specific rulings under certain conditions without permitting the exercise of discretion by the administrative officers of our ports. There has been a constant growth in importations, increasing yearly in volume, decreasing yearly in average value. We refer you also to the statistics of imports compiled by the Department of Commerce and Labor.

The retail value of foreign cars sold in America during a period of six years, with additional parts, is approximately $52,677,046. The value of American cars sold in America for a corresponding period is approximately $250,000,000.

A motor vehicle of any kind can be made in Europe certainly for 60 per cent. of the cost thereof in America, including the manufacturer's profit, as shown in the Fiat case, and by the figures on cost of materials and labor.

We particularly point out that Charles H. Sherrill, representing the importers, and especially the Fiat Company, of Italy and America, stated to your committee that the tariff ought to be reduced to 33 per cent. In other words, such a rate of tariff would be satisfactory to the Italian company as giving it free access to the American market.

It is further of the utmost importance to note that Mr. Sherrill also admited that the 40-horsepower Fiat chassis, which we referred to in our preliminary brief and which we refer to again in this brief as being imported at a customs value of $1,800, was actually imported at a customs value of $1,600, and he further stated that this sum of $1,600 was the full and total sum which went abroad in full payment of the 40-horsepower chassis referred to. We direct your attention especially to a complete and detailed refutation of erroneous statements made by Mr. Sherrill in his hearing before your committee, in the attached appendix and exhibits referred to therein.

We wish most urgently to impress upon your committee that with 60 per cent of American cost a tariff of 65 per cent., plus 5 per cent. freight and import charges, would still permit a European manufacturer to place his product on the American market at 102 per cent. of the American cost—only a margin of protection of 2 per cent. If, however, you assume that average European costs are 65 per cent. of American costs (though American workmen are entitled to protection against the cheapest labor and not the average labor), then a tariff of 45 per cent., plus 5 per cent. for freight and import charges, would put foreign cars on the American market at 97 1-2 per cent. of the American cost.

In Reference to the Commercial Vehicle Industry.

Next, the commercial vehicle industry is taken up, this including trucks and the very freely imported taxicabs. It is insisted that this infant industry requires the same protection accorded the pleasure cars; viz., 45 per cent. duty, for the reason that the industry is still in a state of evolution, involving much present and future experimentation before arriving at a marketable product.

In support of this, it is stated that the Packard Motor Car Company, while asking $3,700 for its three-ton truck, will be obliged to sell hundreds of them in order to make a profit, due in part to the cost of equipment. At this price, an agent's discount of 10 per cent. must be deducted.

On the other hand, the De Dion-Bouton Company, of Paris, is marketing a three-ton truck here valued at $2,500, which, with duty and import charges, is placed on the New York market at $3,700, including both manufacturer's and selling agent's profits.

Then the brief goes on to say:

That note be taken of the fact that our rate is only 10 per cent. higher than the Canadian tariff rate. Even considering Canada's cheaper labor and lower manufacturing cost, they find it necessary to impose a tariff rate nearly equal to our own, and further safeguard their interests by "dumping duty," which is graduated to protect against overproduction and special expert prices abroad.

Automobiles are subject to a duty of 45 per cent., and section 19 provides, whenever imported merchandise is subject to an ad valorem duty based upon the value thereof, the duty shall be assessed upon the actual market value.

Concerning the German Trade Agreement.

The German trade agreement, April 22, 1907, provides: "Market value shall be construed to mean the export price whenever merchandise is sold wholly for export, by reason of which facts there cannot be established a market value based upon the sale of such merchandise in wholesale quantities, packed ready for shipment to the United States."

Thus foreign trade agreement is absolutely contrary to the provisions laid down by Congress.

We protest against reciprocal trade relations as advocated by agricultural implement manufacturers. It seems unjust and unrighteous to remove an adequate protective tariff from one industry in order to induce some foreign government to reduce its rate of tariff on some other American product. The slaughter of one industry for the benefit of another is not in accordance with wise protection.

Again, section 11 provides how customs officers may arrive at market value, but the German trade agreement provides: "The certificates as to value issued by German chambers of commerce shall be accepted by appraisers as competent evidence."

This abolishes the legal requirement of both sections 19 and 11. It is thus possible to make the value of a foreign motor car for import purposes any price which a foreign chamber of commerce will certify to. This mode of undervaluation is being used to-day, thus defeating the entire intent of the American protective tariff.

Statistics of the American Industry.

The National Association of Automobile Manufacturers is described in the brief as composed of the members of both the other organizations and of a number of other manufacturers not affiliated with either organization. The American Motor Car Manufacturers' Association is composed of 44 manufacturers who do not recognize the validity of the Selden patent. The Association of Licensed Automobile Manufacturers is composed of a group of 30 automobile manufacturers of America who recognize the validity of the Selden patent and pay royalties thereunder.

Next follows this general summary of the condition of the industry, accompanied by statistics of its expansion:

About 80 of the American firms engaged are marketing a product that is of some importance to the trade. About 10 per cent. of the whole number (25) have so far, possibly, made a commercial name, but we doubt if even 20 manufacturers can show a fair profit.

Notwithstanding the great number of machines sold and the amount of money invested, it is a fallacy in the public mind that the manufacture of automobiles represents a very large profit. At least 90 per cent. of the manufacturers of automobiles in this country are not to-day making manufacturing profits, and but few concerns engaged in the business have been in any sense successful. This is not because of poor business management, but on account of the large amount of capital required in the experimental and development stages to bring the industry to its present condition and the many unusual risks incident to the conduct of a business of this character. The industry is profitable only in the event of there being an especially desirable product combined with ample capital, skill, and foresight, and a selling ability properly proportioned to market a large product. A record of the development of the industry is submitted herewith:

In 1902:		
Concerns in business	51	
Discontinued that year	18	
Concerns carried over into 1903	33	
Increase during year		33
In 1903:		
Concerns started up	71	
Discontinued the same year	30	
Concerns carried over into 1904	74	
Increase during year		41
In 1904:		
New concerns started	54	
Discontinued	40	
Concerns carried over into 1905	88	
Increase during year		14
In 1905:		
New concerns	51	
Discontinued that year	38	
Carried over into 1906	101	
Increase during year		13
In 1906:		
New concerns	42	
Discontinued	29	
Carried over into 1907	115	
Increase during year		14
In 1907, new concerns		51
		166

Note.—Of the 51 concerns in business in 1902 only 21 survive and are in business to-day.

And, Finally, the Conclusion of the Brief.

In closing our appeal for an adequate protective tariff and adequate means for enforcing the intent of same we respectfully submit that it is our desire to ask only a sufficient and adequate rate of tariff and such a wise and proper classification as will promote the best interests of the motor-vehicle industry and those industries allied with it. We believe our statements and allegations are correct and founded on facts. We believe in the sound wisdom of the tariff protective policy of our country. We believe that tariff revision means exactly what it says, namely, that it is the intent of the people of the United States, of the Congress, and of the President-elect Taft, to have the tariff so revised as to justify the continued upbuilding of, and investment of money in, American industries under American wage conditions as they exist to-day, whether it may require increases or decreases of rates, or the maintenance of existing rates.

Respectfully submitted.

HENRY B. JOY,
President Packard Motor Car Company and Chairman Tariff Committee of Association of Licensed Automobile Manufacturers.

BENJAMIN BRISCOE,
President Maxwell-Briscoe Motor Company and Chairman of Committee of Management of American Motor Car Manufacturers' Association.

WHAT NEW JERSEY'S GOVERNOR NOW SUGGESTS

TRENTON, N. J., Jan. 12.—Gov. Fort in his message to the Legislature suggested that special regulations in the open country should be liberal, and that 30 miles an hour could safely be permitted instead of the present maximum of 20 miles.

The disappointing feature of his recommendations is that he cannot yet see his way clear to suggesting a reciprocity in registrations with other States which now can be entered by New Jersey automobilists because of their home registrations. The Governor recommends, however, that a more simple and easy method of procuring a license be especially provided for non-residents. Among other things he says:

"The automobile is with us and it has come to stay. It must be given all highway rights, under proper restrictions to protect the public and the occupants of the machine. Railroad regulations as to the running of trains, safety appliances and the like are intended for the protection of the passenger more, if anything, than the traveler crossing the track. All vehicles upon the public highway should be required to carry lights. Arrest and trial should not be summary, but the right to stop should only exist to inquire as to the possession by the driver of the machine of the requisite authority or to obtain its number if violation of law be claimed.

"Suit should only be instituted by direction of the department in proper courts near the residence of the alleged offender or at convenient points within the State for the non-resident. Wilful injury to person or property by the driver of a car, or such injury by an intoxicated driver, should be a misdemeanor and punishable accordingly, without of course the loss of right to maintain a civil suit by the injured party or the owner of the damaged property. The present license fees are not excessive and should not be modified by any reduction unless it be through some system of uniform legislation between the States."

REVISED RESULT OF QUAKER CITY ENDURANCE RUN

PHILADELPHIA, Jan. 11.—As a result of successful protests by several of the contestants in the New Year's endurance run of the Quaker City Motor Club, there have been not a few changes in the final standing, and even this may not be final, for at least one of the contestants has carried his case to the A. A. A. and others may do likewise.

When the first finish results were posted, the Oldsmobile people got busy on Monday and proved that Folberth and Berger, drivers respectively of Nos. 12 and 23, had been held up on Giant's Despair through being blocked by the Acme (No. 4). They were consequently relieved of demerits, which place them in second and third places, respectively. Folberth got rid of 220 bad marks and Berger 371. Laurent Grosso's Stearns, No. 24, moved up from ninth to fourth place when the committee relieved him of 219 road demerits. These successful protests pushed the Dietrich-Matheson, with a total of 37 penalties—all technical—down to fifth place.

The revised order of finish brought forth another cloud of protests, and on Wednesday afternoon a special meeting of the contest committee was held to thresh out the whole matter. As a result of the testimony adduced there four Class A cars were

Matheson No. 7, Winner of the Quaker City Endurance Run.

This photograph was taken on the return of the car to Wilkes-Barre after the race. Reading from left to right, those in the tonneau are: W. Miller, driver; Harry Sidel, timekeeper; A. T. Stewart, representing MacDonald & Campbell, donors of the Quaker City cup; F. M. Kirby, owner and entrant; F. F. Matheson, general manager of the Matheson Company; Jack DeWitt, mechanician, and C. W. Matheson, president of the Matheson Company.

disqualified entirely—Tuttle's Stoddard-Dayton, No. 13; Carris' Franklin, No. 10, which had been originally placed No. 2 at the finish; Darnstaedt's Rambler, No. 19; Ray McNamara's Premier, No. 21—either for receiving outside assistance in climbing Giant's Despair, for getting up the mountains sans passengers, or both.

The Premier people were represented by an attorney, John Handy Hall, and he and the Quaker City Motor Club's legal sharp, G. Douglass Bartlett, had a lengthy battle. The Premierite's testimony showed that while the car had run a short distance—probably 50 yards—without its passengers, the driver had done so with a clear understanding that such a proceeding was justifiable. in the event that it was found impossible to secure traction otherwise; that, in response to a query the night before, Dr. J. R. Overpeck, a member of the committee, had declared that the unloading of passengers under such conditions on a slippery hill would not be punishable. On the ground that the Premier had gone passengerless farther than was necessary to secure traction, the committee voted to disqualify the car. Attorney Hall immediately gave notice that an appeal would be carried to the A. A. A. in order to secure the Premier's rights. On the face of the reports the 18-points penalty accumulated by the Premier from the checker's cards would give that car fourth place if the appeal to the national body is successful.

The overwhelming Matheson success, which the first decision of the contest showed and which was somewhat dimmed by the success of the Oldsmobile and Stearns appeals, was still further marred by the imposition of additional checkers' penalties on the Anderson-Matheson, No. 15, which the cards showed had checked in ahead of time at one or two controls. The additional demerits, with the "butting in" of the Oldsmobiles and Stearns, put Anderson in sixth place and the last of the Matheson trio instead of second.

As finally reckoned out, the final standing (barring the result of the Premier appeal) is as follows:

CLASS A.

No.	Car.	Driver	Ch's.	Obs'rs.	Tech'l	Total
7.	Matheson	Miller	0	1	10	11
12.	Oldsmobile	Folberth	0	4	9	13
23.	Oldsmobile	Berger	5	0	10	15
24.	Stearns	Grosso	0	1	29	30
6.	Matheson	Dietrich	0	0	37	37
15.	Matheson	Anderson	44	3	23	70
3.	Cadillac	Burnshaw	43	1	37	81
10.	Mitchell	Freitag	110	2	15	127
2.	Cadillac	Crawford	112	0	23	135
8.	Stoddard-Dayton	Shirk	37	77	26	140
14.	Studebaker	Yerger	189	2	4	195
4.	Acme	McCormick	236	2	31	269
20.	Maxwell	Bitner	441	34	265	758
5.	Elmore	Hardart	Out.			
9.	Mitchell	Cram	No observer's cards.			
11.	Winton	Depew	Out.			
13.	Stoddard-Dayton	Tuttle	Disqualified.			
16.	Franklin	Luckenbach	Out.			
17.	Winton	Schenck	Out.			
18.	Franklin	Carris	Disqualified.			
19.	Rambler	Darnstaedt	Disqualified.			
21.	Premier	McNamara	Disqualified.			

CLASS B.

No.	Car.	Driver	Ch's.	Obs'rs.	Tech'l	Total
5.	Peerless	Brooks	26	2	22	50

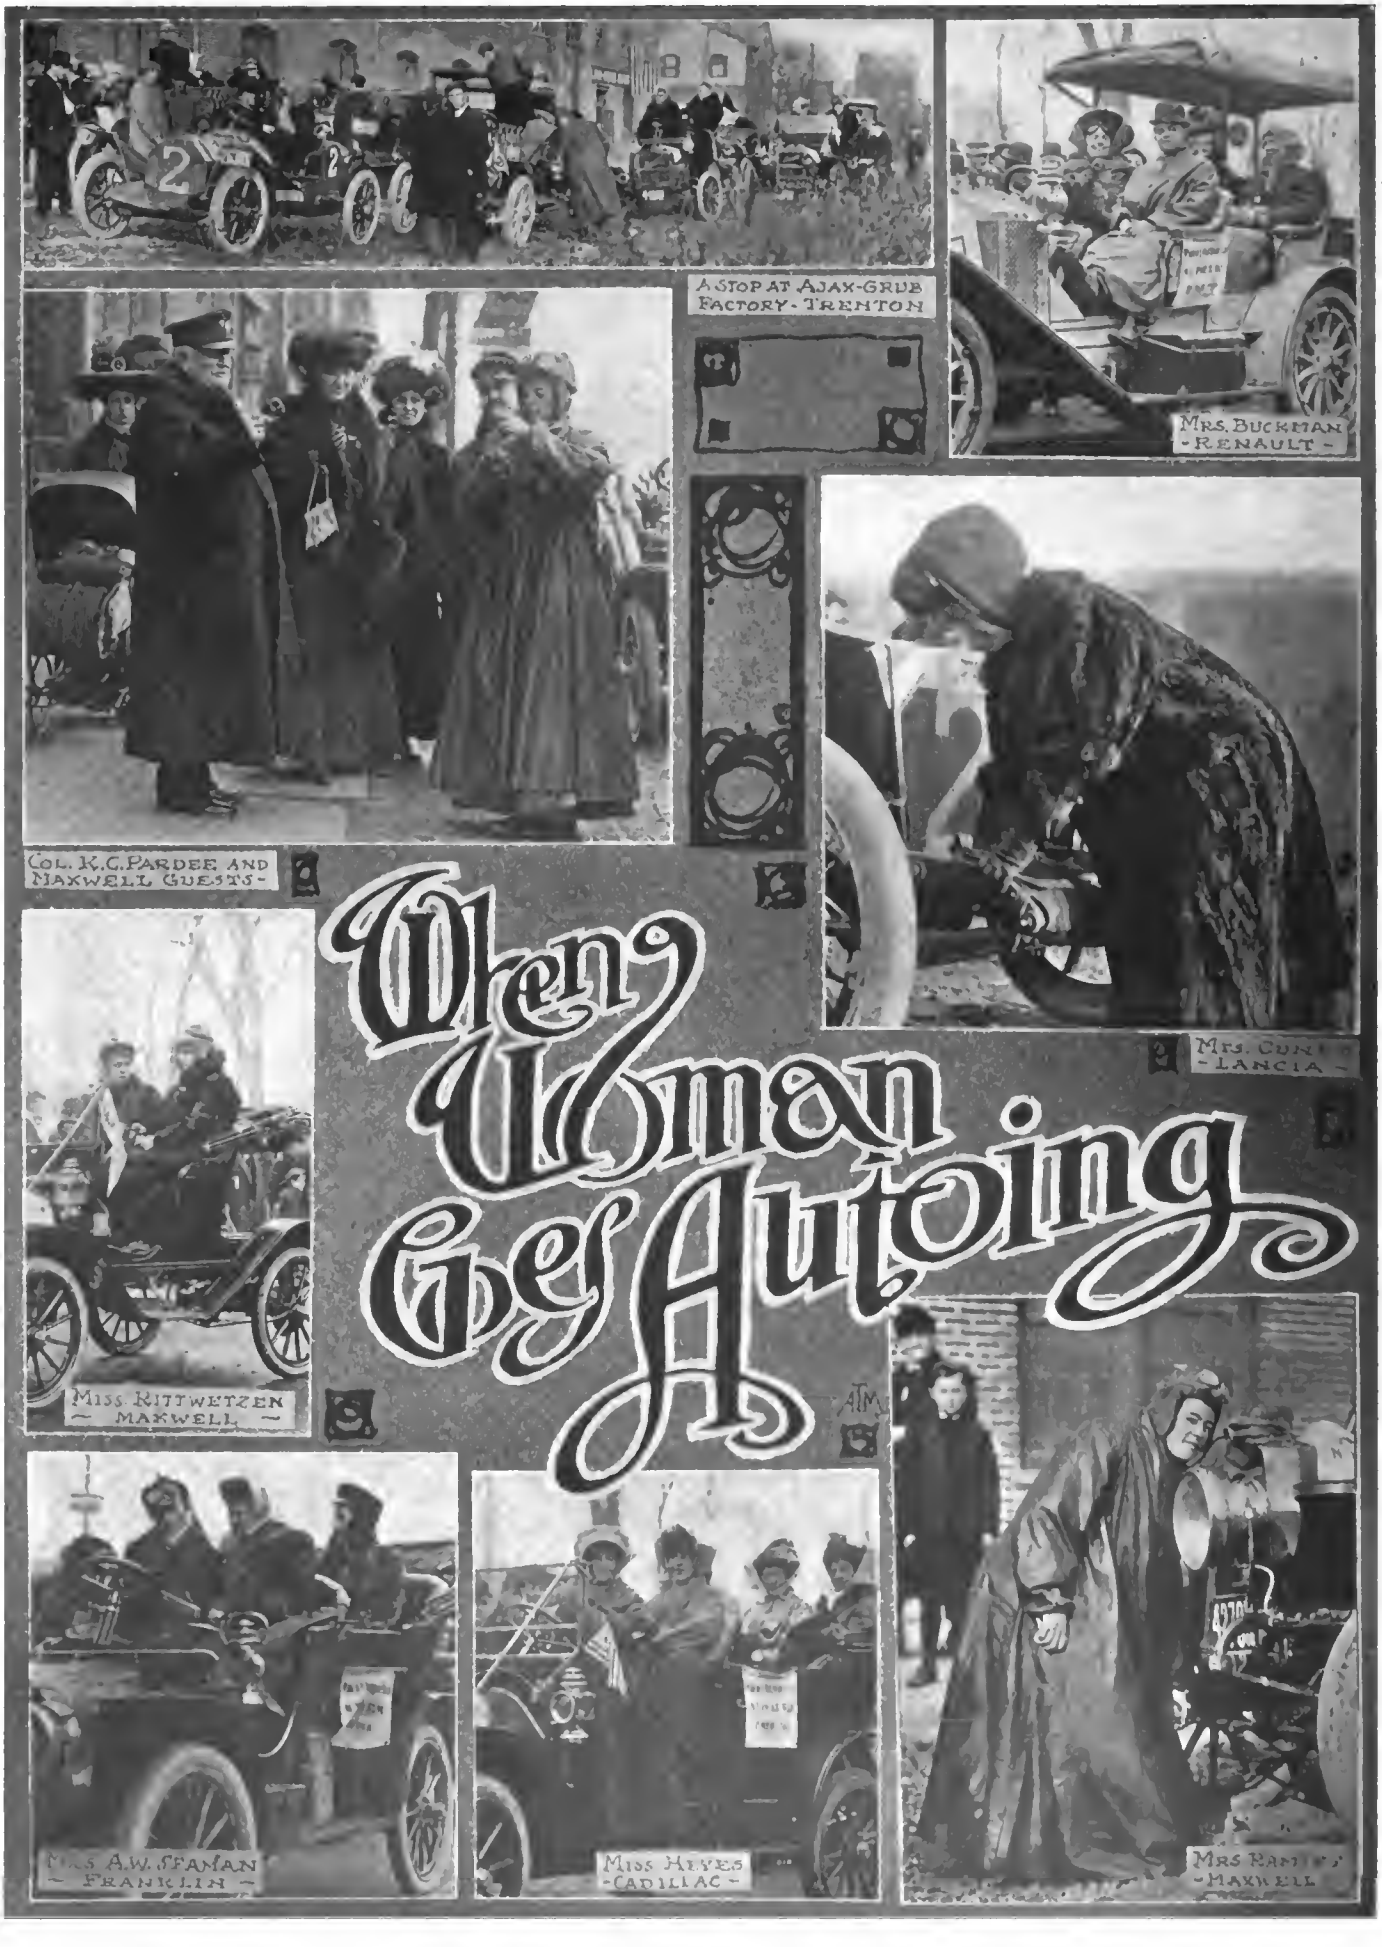
3.	Oldsmobile	Webster	Out.			
6.	Knox	Bourque	Out.			
7.	Rambler	Brown	Out.			
8.	Buick	Wilkie	Out.			

THE NEWS FROM TIRETOWN.

AKRON, O., Jan. 10.—Tire manufacturers are estimating that the total value of their product here this year will almost equal $15,000,000. Notwithstanding the depression of the past two years, the season of 1908 was a record-breaker for tires, and a bright outlook for this class of rubber products is looked for. Manufacturers returning from the Palace show estimate that the number of cars to be sold this year will equal 75,000, which will tax the tire plants. The manufacturers will not only be called upon to furnish tires for the new cars, but the cars now in use, believed to number 150,000, will require many tires.

The Akron Automobile Dealers' Association has been organized by the election of E. T. Jones, president; Fred Feckley, vice-president; L. J. Fritsch, secretary; J. M. Sauder, treasurer. The association will have an automobile and motor boat show in the East Market street rink, January 28, 29 and 30. Motorcycles will also be shown.

The Firestone Relief Association has perfected its organization by electing the following officers: President, J. S. Hill; vice-president, Daniel Goodenberger; recording secretary, James R. Neely; treasurer, George Kelly; financial secretary, Lee Clough; captain, Cyrus Reading; trustees, William MacAllister, Charles H. Gardner and William Heller. During the course of the exercises, President H. S. Firestone addressed the members, which is composed of employees, and presented the association with the company's check for $500. Mr. Firestone recommended that when members leave the employ of the company their membership shall lapse after a certain time in order to make the association restrictive as much as possible.



WOMEN HAVE A NEW YORK–PHILADELPHIA ENDURANCE RUN

ONCE upon a time, not so very many years ago, a score or more of so-called automobiles, driven by would-be automobilists, attempted to make a journey from New York to Philadelphia in one day. It was a hard struggle, and the derelicts were strung along the road between the metropolis and Quakertown, the conclusion having comparatively few survivors. That was the first real long run ever undertaken in this country, the event having been the initiatory of the industry as well as the first effort of the Automobile Club of America.

On Monday morning of this week there started for Philadelphia ten automobiles with drivers of the fair sex at the wheels, and the whole ten comfortably reached Philadelphia in the shank of the evening, despite the rough roads and weather that was a close approach to Winter. As things are rated nowadays in automobiling, it was not such a much of a run, but at the same time the "Women's Motoring Club" demonstrated that the driving of an automobile is a task which is not beyond the capabilities of the so-called weaker sex.

The "stunt" may have looked considerably like an advertising proposition, but even so it was cleverly accomplished, and the two-day run must be looked upon as a happening which adds to the evidence of the universality of motor-driven transportation as advancing with bounds. "Alex" Schwalbach was most of the "committee," with "Senator" Morgan interested.

Officially started by E. L. Ferguson, who "checks out on the Glidden tour," and supplied with real route books, these ten started Monday morning with other escorting cars from the Plaza Hotel bound for the Hotel Walton in Philadelphia.

1. Maxwell runabout—Mrs. J. R. Ramsey, Hackensack, N. J.
2. Lancia "Lampo" runabout—Mrs. J. N. Cuneo, Jamaica, L. I.
3. Maxwell runabout—Mrs. L. Gillespie, Poughkeepsie, N. Y.
4. Franklin four-cylinder—Mrs. A. W. Seaman, Brooklyn, N. Y.
5. Renault "23" touring car—Mrs. E. M. Beeckman, New York.
6. Maxwell runabout—Miss B. M. Rittwetzen, Huntington, L. I.
7. Cadillac four-cylinder—Miss Alice D. Heyes, New York City.
9. Maxwell runabout—Mrs. J. G. Kirkman, Brooklyn, N. Y.
11. Maxwell—Mrs. P. Bach, Newark, N. J.
12. Maxwell four-cylinder—Mrs. E. G. Gresh, Norristown, Pa.

In the run to Philadelphia on Monday the weather was quite comfortable. En route the party was entertained at the Ajax-Grieb Rubber Company plant in Trenton, President Horace De Lisser being the host of the occasion. The first to arrive at the Philadelphia city line was Mrs. Cuneo, who was one hour ahead of the schedule. Dr. J. R. Overpeck, of the Quaker City Motor Club, escorted the participants to the Hotel Walton, where in the evening Mayor Reyburn contributed an address of welcome.

The return journey of Tuesday was not quite as enjoyable as the outward trip. At New Brunswick a light but cold rain was encountered, and these conditions continued to the conclusion. At Trenton Governor Fort had socially said, "How do you do?" and at Grant City on Staten Island the Richmond County Automobile Club supplied a luncheon.

The first one to arrive at the Plaza Hotel was Mrs. Cuneo, whose clever handling of the Lancia "Lampo" was a feature of the run. In connection with her driving of this car, attention might be called to the fact that this winner of the light car race at Savannah is "stock," for Lancia only supplies one type of engine as to bore and stroke, viz., 90 mm. bore and 100 mm. stroke. This is the size of the four-cylinder "Lampo" type roadster, and even the cylinders of the "six" are all the same. The only actual difference in the "Lampo" engine from the others, to be exact, is asserted to be the method of timing and slightly increased valve area, which is a combination that permits the motor to run at considerably higher speed. In this manner Lancia claims to secure his greater speed results, for no devices are utilized to increase the compression.

After the participants had been "checked in," it was announced that the selection of the prize winners might not be determined for several days.

The Maxwell-Briscoe Motor Company offered a bronze trophy to the driver of the Maxwell car making the best showing, and the Hol-Tan Company offered a silver cup, though Mrs. Cuneo was barred from competing for it. No matter who wins the prizes, all the survivors made a most excellent showing and demonstrated that the driving of an automobile has become a task well within the ability of the average woman.

INDIANA MAY HAVE AN AUTOWAY.

INDIANAPOLIS, Ind., Jan. 11.—With the purchase of a large tract of ground northwest of the city by a number of automobile men, plans for an automobile race course that may attain a national reputation have become known. A company is to be formed at once, the proposed capital stock having all been subscribed and work on a twenty-six mile course will be started.

As planned, the tract of ground will provide an oblong track, two miles around the outer edge. It will wind towards the center, making a course twenty-six miles long. An ampitheatre will be built, from which it will be possible to watch the contesting cars at all parts of the course.

Improvements are to be made that will cost $250,000 on the course, which is one mile long and one-half mile wide. The plans include a union station, as the course touches a steam railroad and an electric interurban line.

Carl G. Fisher, a local automobile dealer, is father of the project. With George M. Schebler and James A. Allison he has carried out the preliminaries, each investing $15,000. Other automobile men are also interested in the project.

The course will be located near Riverside Park, just northwest of the city. The promoters estimate that cars can attain a speed of 120 miles an hour on the outer portion of the course and sixty miles an hour on the inside track, and there will be practically no danger of accidents to spectators because of the peculiar arrangement of the track. Work on the course is to be started at once.

WASHINGTONIANS ELECT OFFICERS.

WASHINGTON, D. C., Jan. 10.—The annual meeting of the Automobile Club of Washington resulted in the following officers for the ensuing year: President, W. D. West; vice-president, O. J. DeMoll; secretary, John K. Heyl; treasurer, H. C. Chandlee; captain, J. A. Muehleisen; lieutenant, Lester D. Moore, Jr.; governors, R. B. Caverly, W. W. Chiswell, Fulton R. Gordon and J. M. Stoddard. The reports of the retiring officers indicated that the club was in a flourishing condition, the membership having increased from 69 to 130 during the year. Plans are on foot for increasing interest in the club and the new officers have promised they will leave no stone unturned.

BALTIMOREANS WANT A SHOW.

BALTIMORE, Jan. 11.—At the regular fortnightly meeting of the Automobile Club of Maryland the past week, D. C. Walker was appointed chairman of a committee to work up plans for an automobile show to be given under the auspices of the club. The main obstacle in the club's way at present is the securing of ample quarters for holding the affair. The committee is now looking around for a place large enough for a show. Should they be successful it is the idea of the club members to have the exhibition take place about February 24.

The club appointed a committee to co-operate with the national roads committee of the American Automobile Association, with Benjamin Friedenwald, of Baltimore, as chairman.

C. H. METZ ACQUIRES WALTHAM PLANT.

WALTHAM, MASS., Jan. 11.—By his acquisition of the Waltham Manufacturing Company's plant, C. H. Metz returns to the control of a plant that he was largely instrumental in developing in its early days, and will be the largest individual operator of an automobile plant in this country, as he is planning to turn out 5,000 cars. The Waltham Manufacturing Company was organized by Mr. Metz in 1893, and he then startled the bicycle riding fraternity by bringing out a 21-pound machine that was guaranteed to stand up under any condition of road, load or speed. The novel features first brought out in the Orient bicycle of that day are still said to be standard in bicycle construction at the present time. Thousands of the machines were sold, and four years later Mr. Metz parted with his controlling interest in the company.

The Waltham Manufacturing Company was the first in this country to take up the manufacture of automobiles using the Daimler motor. One of Mr. Metz's hobbies was the Orient bicycle, which used the Daimler type of motor, and in order to develop it according to his own liking, he severed his connection with the company altogether in 1901 and began building motorcycles on his own account. Subsequently he became affiliated with the American Motor Company, manufacturing the Marsh-Metz motorcycles. It is said that the car Mr. Metz is planning to produce in the Waltham factory will embody many features of light weight and strong construction.

The chronology of Mr. Metz's experience in the bicycle and automobile industry is interesting and is accordingly given below:

1883 Local sales agent for Columbia machines.
1885 Champion bicylist of Central New York—home in Utica.
1886 Manufacturer of bicycle attachments.
1889 Joined Union Cycle Company at Highlandville, Mass.
1890 Led crusade for lighter bicycle construction.
1891 Invented Dunlop detachable tire principle.
1892 Joint interest in Dunlop tire patent sold for $100,000.
1893 Organized Waltham Manufacturing Company.
1894 Produced lightest practical roadster bicycle.
1895 Output increased to 1,500 machines.
1896 Output increased to 4,500 machines. Made 4, 5 and 6-seated bicycles. Famous through their use in pacing world's champion riders.
1897 Output reaches 15,000 machines. Made 10-seated bicycle—the Oriten—the largest bicycle ever built.
1898 Made automobiles. Produced the first motorcycle in America.
1901 Severed connection with Waltham Manufacturing Company. Became technical editor on staff of "C & A Trade Journal."
1902 Built Metz motorcycles. Made American record for one mile on Staten Island—time, 1-10 2-5.
1903 Introduced grip control and other original motorcycle features.
1905 Affiliated with American Motor Company.
1906 Developed Marsh-Metz motorcycle.
1907 Introduced new features in Marsh-Metz construction.
1908 Developed Metz plan car.
1909 Acquired plant of Waltham Manufacturing Company.

Thus it would appear that Mr. Metz has qualified for a still greater success by his long and varied experience.

GOODYEAR SEEKS TO PREVENT PRICE CUTTING.

AKRON, O., Jan. 11.—As a result of the more or less recent formation of several organizations, the chief object in life of which has been the supplying of accessories at cut prices, and particularly tires, the Goodyear Tire & Rubber Company is taking steps to protect its dealers against competition from this source. In a circular letter it calls attention to the "International Automobile League," Buffalo, N. Y.; "Co-operative Auto Association of America," New York, and the "Bureau of Automobile Auditors," also of New York. These organizations advertise that they are able to supply tires and other supplies to the consumer at dealers' prices, and to do this it is necessary that they should be able to obtain trade discounts through certain dealers.

In order to put a stop to this practice the Goodyear company is requesting its dealers to inform it of the serial numbers of tires thus purchased that have come under their notice. By this means it will be possible to trace the original purchaser of the tire and thus determine the channel through which it reached the price cutting association. Trade prices will be immediately withdrawn from any dealer who is found to be selling Goodyear tires in this manner, and he will be placed upon the same basis as the consumer.

KISSELKAR "CLIMBS" A 14-STORY HOUSE.

As a result of a wager, a 30-horsepower KisselKar "climbed" to the upper levels of the new Fifth avenue building, now in course of construction on the site of the old Fifth Avenue Hotel at Twenty-third street and Broadway, one day last week. But the car did so at the end of four stout steel hooks attached to it, and forming parts of a four-piece bridle at the end of a steel cable and hoisting engine, and thereby hangs the tale.

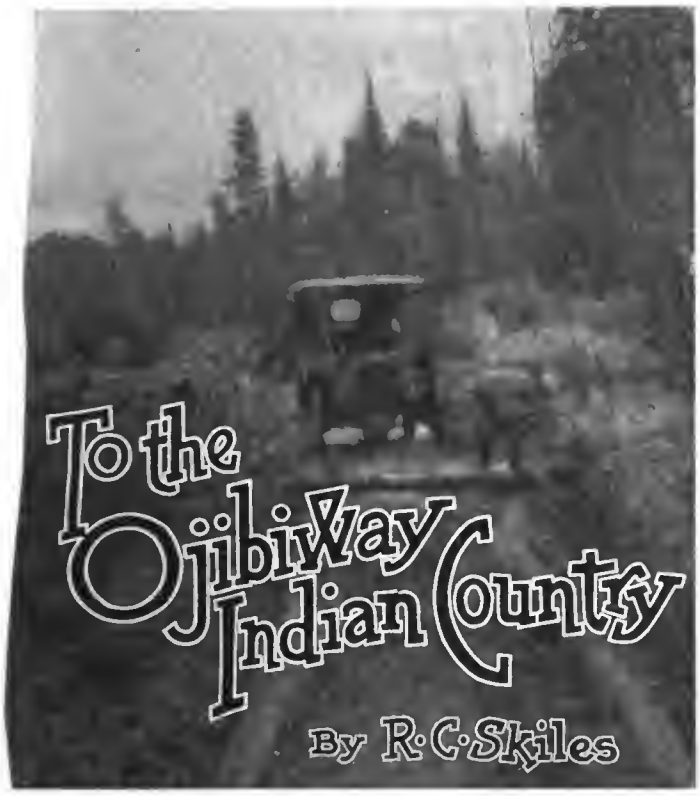
It seems that F. S. Dickinson, manager of the New York branch of the KisselKar company, of Hartford, Wis., and F. J. Wagner, the well-known race starter, had slightly different opinions on the subject of climbing. Mr. Dickinson was quite certain that the Model LD-9 30-horsepower KisselKar, which is the $1,500 offering of that company for 1909, was the greatest hill-climber ever, and that there were few things it could not romp up "on the high." "Wag" dissented, which statement led to the wager aforesaid. A 30-horsepower KisselKar runabout

F. S. Dickinson's KisselKar Aloft in Madison Square.

of the type in question was driven down to the new Metropolitan tower, for Wagner had ambitions to climb the highest building he could find. The hoisting lines were attached and everything was about ready to take the car and its passengers aloft, when the officials of the Metropolitan happened along for the purpose of inspecting the new chimes that are to hang in the tower. They immediately put a stop to the "stunt," in view of the hazardous nature of the undertaking being contrary to their principles, and an adjournment was taken to the new Fifth avenue building on the other side of Madison Square, with better success, as the photograph demonstrates.

GRAY & DAVIS SECURE WRIDGWAY LICENSE.

Gray & Davis, the well-known automobile and carriage lamp makers, of Amesbury, Mass., have secured the license to make the Wridgway Non-Glare Shade, and the firm is the only lamp manufacturer to receive such a license. Recently an ordinance was passed in New York City prohibiting the use of searchlights in city limits, unless properly subdued in such manner as not to interfere with other users of the road.



To Reach this Beautiful Country Requires Work.

IT was in company with my wife that on a pleasant morning of August—the 13th, to be exact, for we were not superstitious—that I began a drive from Shelby, O., to the north of the Ojibiway Indian and the historic Hudson Bay country. From Shelby to Cleveland to Buffalo, the miles were traversed by our four-cylinder Buick without an accident worth the mention. Then we visited the cataract of Niagara and crossed into Canada, first going to Hamilton and then to Toronto, where we were told it would be folly to drive any farther north than Gravenhurst, at the foot of the Muskoka lakes and in the heart of the game-fishing region.

Gravenhurst is a long way from North Bay, Ontario—which is on Lake Nipissing, the supply station for the Cobalt, the destination we had in mind—and we determined to get as near there as possible. So with thorn and waterproof clothing, plenty of oil and gas, and a good toolcase, including an ax, which I purchased in Toronto, we left Gravenhurst, the end of good roads behind us. As far as Bracebridge, some 10 or 12 miles farther north, we followed the Ontario Motor League guide book over a very stony road, which was a constant climb of the Ontario highlands toward the height of land. The guide book gave a very attractive route through to North Bay, with an encouraging footnote, "Good roads the whole way," and believing this authority to be reliable, we left Bracebridge confident of an easy trip. At the first stop for water a Hebrew peddler was encountered who had traveled the country by wagon to within 60 miles of North Bay, and he advised me to take a different road from the one given in the guide book, so his route over the old Parry Sound road was very fortunately taken. This peddler was of service to us, and we thanked him, but we fear that another road peddler whom we met did not thank us. His horse was frightened and bolted. As the horse running away passed us, we heard the peddler say to him, "Wait a minute, Jack"! Rather a peculiar request to make of a horse that was running away!

Through country that would seem impassable to the average autoist, the road climbed up to the highlands in the beautiful Lake of Bays district, where out from behind every hill a clear little lake lay shimmering in the sunlight. Even this far along an automobile was a curiosity, but the people could call it by name, which was more than the more northern settlers could do. After a hard drive from Gravenhurst for seven hours, we reached Huntsville. We had covered only 33 miles. The next day, between 9 A. M. and 4 P. M., the car climbed over rocks and up hills, occasionally passing through a lumber camp, to South River, 60 miles nearer the cherished destination, but where we were told that we could go no farther. Two cars made the attempt last year, but failing to climb the noted South River hill, turned back. This was cheering information, but after sleeping over the prospect of taking the hill and getting over the roads beyond, I decided to make the effort, and in case of failure, store the machine at South River, and go on by the Grand Trunk Railroad to North Bay.

Leaving South River at 8 A. M. in a pouring rain, we started for the big hill, four miles out of town. The approach to it was over stones and loose corduroy, with no opportunity to get up speed. The hill itself was of wet, slippery yellow clay covered with loose stones, and two abrupt turns had to be made before the summit was reached. The car made a brave fight with the rocks and mud until the first turn was reached, and there the danger of skidding down the abrupt mountain side was so great that we backed the machine down and cut by hand a space large enough to turn around in. Sorely disappointed, we drove back to South River, not to store the car, however, but to wait for a dry day, when I was confident the climb could be made. Upon reaching the town a bystander suggested that we try the "winter road," and thus avoid the hill. Eager to make North Bay and blissfully ignorant of the character of a "winter road," we made a second start. The first few miles was over the usual hills, stones and corduroy into a forest that gradually grew more and more dense. Suddenly the beaten track seemed to end and the forest closed in upon us, but since there was no place to turn aside, we kept on, sometimes plunging down the rocks into a bed of spongy moss, sometimes climbing up the rocks into the low hanging clouds, but scarcely ever going more than five feet without stopping to figure out the best way to drive the next five. Stumps and fallen timber soon came to be trifling obstacles, for they would yield to the ax, but the boulders were a very different problem. They were so many and so high that in places where the car would not clear them or where it was not possible to chop a way around them, the wheels would have to be jacked up, filled under with brush and then driven over. After fifteen miles of such driving we came out into the light of a small clearing, where a wood cutter with his wife and eight small children lived in a little cabin. Having never seen an automobile before they were almost speechless with fright, and unable for a time to respond to a request for water, which the engine was thirsting for. It seems no one had tried to get over the road since winter, when, as was learned later, the cleared path is filled in with brush after the first snowfall, then sprinkled with water, which, freezing, forms an ice road for the lumbermen's sleds. This lone inhabitant had made

Farthest North—Note Other Horseless Carriage.

a slightly better clearing, for his own use, to Tout Creek, some seven miles further, where the South River hill road was met. From there on the track was clearer and easier to distinguish, having been surveyed by the Bell Telephone Company, which is putting a line through to the Cobalt.

At six o'clock that night the faithful old car climbed over the last hill and down the rocks into North Bay, where no automobile had ever come or ever been expected to come by its own power. The picture shows a part of this town, with its galvanized iron covered buildings, and one of the local means of conveyance, an ox team.

By the time a hotel was reached, men, women and children had surged around the car until it was almost impossible for Mrs. Skiles and myself to get out. The children begged to sit in it, the men and women alike pulled at the lamps, the horn, or anything that looked detachable, and one curiously inclined fellow stuck his knife through a tire to see if it were solid—and that, after all those 850 miles without a puncture!

With the aid of the police a safe storage room was found where the car was left until we were ready for the return trip, three weeks later. By that time the country was so dry that the South River hill was climbed without difficulty, and with the exception of an exciting night ride through a bush fire our experiences were very much the same as in the drive north. The time, however, was shortened, requiring only four days for the return trip. The indistinctness of the picture in the heading was caused by the intense smoke from the forest fires which pervaded the whole of Northern Canada during August and September.

The courtesy with which the Canadian people treat the motorist makes traveling in their country especially delightful. Indeed, the price of gasoline, ranging from 25 to 30 cents, and the poor hotel accommodations are all one could possibly find fault with, but the latter difficulty can be overcome by carrying a cooking outfit, and preparing one's own meals.

This may not appeal to the reader as a pleasure trip, but it was to us, and certainly one full of rich experiences, besides being a genuine test for the car. Among the humorous experiences was one we had near Bracebridge, Ont., where we came very near breaking up a funeral. In fact, we came close to causing another, as one man, attempting to pass our machine, was thrown from no less than three different buggies in which he tried to ride by.

PANHARD OIL MADE AND SOLD BY G. A. HAWS.

Panhard Oil has become familiar to all automobilists through its American manufacture and marketing by George A. Haws, 73 Pine street, New York City. This manufacturer of lubricating oils and greases will have an exhibit in the Madison Square Garden show, where will be shown the various grades of Panhard oil, light, medium and heavy, and also Panhard greases for various uses.

Through an unfortunate error in the January 7 story of the Grand Central Palace show another concern was mistakenly given credit for Panhard oil success in America. A suit is now pending against a New York concern for placing an oil on the market called Panhard. All the evidence is in and a decision will probably follow in the next fortnight or so.

PLANS POR THE SHOW OF THE SOUTHWEST.

St. Louis, Jan. 11.—The best and largest automobile show ever given in St. Louis will be held February 15 to 20 in the new Coliseum, under the direction of the St. Louis Automobile Manufacturers' and Dealers' Association. The building, which is very large, could not be better arranged for this purpose. It will permit of an artistic and convenient placing of exhibits, and in a manner which will make all spaces very desirable.

The manufacturers will do well to bear in mind that this show will mean much to them, for the reason that St. Louis and the Southwest offer an excellent market at present.

A. L. A. M. DECLARES A DIVIDEND.

At the A.L.A.M. meeting, held January 7 at the New York City offices, it was decided to pay a dividend of $50,000 from the reserve fund of the association.

The last formality finally affecting the severance of the membership relations of the Olds Motor Works was carried out.

Col. Charles Clifton, the presiding officer, gave a talk on affairs on the other side, making it apparent that the foreign makers are feeling the effects of their inability to compete in the American market as in the past.

L. H. Kittredge, another recent foreign visitor, told of the wearing out of the French roads owing to the heavy automobile traffic. He also said that high-powered cars predominate in England, whereas in France low-powered machines are now the more numerous.

H. B. Joy, chairman of the Automobile Manufacturers' Tariff Committee, reported on the brief recently submitted to the Ways and Means Committee of the lower house of Congress. The document will be generously distributed throughout the country, for the facts therein contained are of general interest.

Present at the session were the following: Elmer Apperson, Apperson Bros. Auto Co.; John S. Clarke, Autocar Co.; W. C. Durant, Buick Motor Co.; W. C. Leland, Cadillac Motor Car Co.; H. Chalmers and R. D. Chapin, Chalmers-Detroit Motor Co.; M. S. Hart, Corbin Motor Vehicle Corp.; J. H. Becker, Elmore Mfg. Co.; W. E. Metzger, Everitt-Metzger-Flanders Co.; H. H. Franklin and G. H. Stilwell, H. H. Franklin Mfg. Co.; E. W. Headington, Haynes Auto Co.; A. N. Mayor, Knox Auto Co.; S. T. Davis, Jr., Locomobile Co. of America; H. A. Lozier, Lozier Motor Co.; H. B. Joy and M. J. Budlong, Packard Motor Car Co.; L. H. Kittredge, Peerless Motor Car Co.; Charles Clifton, The George N. Pierce Co.; George Pope, Pope Motor Car Co.; George J. Dunham, Royal Tourist Car Co.; G. E. Mitchell, Alden Sampson Mfg. Co.; R. H. Salmons, Selden Motor Vehicle Co.; Roy F. York, F. B. Stearns Co.; I. H. Page and C. C. Hildebrand, Stevens-Duryea Co.; L. J. Hart, Waltham Mfg. Co.; Thos. Henderson, Winton Motor Carriage Co.

COIL MAKERS COMBINE TO FIGHT PATENT.

The Allied Coil Manufacturers' Association is the title of a new organization that came into being as the result of a meeting held at the Prince George Hotel, New York City, by a number of representative coil manufacturers who were exhibiting at the recent Palace show. The officers are:

President, Frank Brandow, of the Jacobson-Brandow Company, Pittsfield, Mass.; vice-president, C. P. Byrne, of the Kokomo Electric Company, Kokomo, Ind.; treasurer and secretary, John O. Heinze, Heinze Electric Company, Lowell, Mass. The executive committee of the association is composel of the foregoing officers in addition to the following: Charles F. Splitdorf, Splitdorf Laboratory; F. A. Wood, National Coil Company, Lansing, Mich., and W. P. Wood, Pittsfield Spark Coil Company, Dalton, Mass.

The object of the organization is to defend the rights of its various members to manufacture, use and sell interchangeable unit spark coils, combining in order to reduce the burden of legal expense. The interchangeable unit coil as now generally used is covered by a number of patents, that involving the basis of unit construction being claimed as basic by its owners. It is this point in particular that American coil manufacturers dispute, their claim being that such patents only cover specific details and are not in any sense basic.

Those present at the meeting and the companies they represent follow: A. H. Stroud, Chicago Coil Company, Chicago, Ill.; C. P. L. Noxon, Syracuse, N. Y.; C. P. Byrne, Kokomo Electric Company, Kokomo, Ind.; C. F. Splitdorf, Walton avenue, New York; F. A. Wood, National Coil Company, Lansing, Mich.; W. P. Wood, Pittsfield Spark Coil Company, Dalton, Mass.; George Parker, American Coil Company, Foxboro, Mass.; H. G. Mears, New York Coil Company, 338 Pearl street, New York, and E. J. Huber, Duplex Coil Company, Fond du Lac, Wis.

GIVE YOUR CAR THE CARE IT NEEDS

By CHARLES D. SMITH.

WHO is to blame—is it you, Mr. Manufacturer, or is it you, Mr. Owner? To blame for what, Mr. Owner? For "knocking," refusal to pay repair bills, incessant fault-finding with the man who looks after your best interests (whether he be a brass polisher, floor man, garage or repair shop foreman or superintendent), for literally tearing to pieces Mr. Manufacturer's advertising, selling, repairing and manufacturing policies? If you do any of these things, Mr. Owner, you are to blame. You immediately cry, "Why! Am I not the aggrieved party?" Let us see if you are.

Incompetent Owners.

First, are you a "knocker"? You have always been a broker, baker or candlestick-maker—anything but a mechanical man. You buy a car, have a few minutes' or a few hours' instruction in the method of operating it and the adjustment of a few of the most important parts. But it is safe to say that, with your limited knowledge of anything mechanical, and the hundred and one new features coming to you suddenly, you have forgotten nine out of ten of the things you were told, even before you have driven your car one mile. Then some little thing (very trivial to the expert) goes wrong. You say, "It's the machine." Sure, it was the machine; perhaps the fault of the manufacturer, and perhaps the way you have cared for the machine. But you, Mr. Owner, ninety-nine times out of a hundred, will go back to the repair man and swear by blue streaks (and sometimes blue cuss words) that the machine has never been right since you had it and that you are entitled to a new one.

Mr. Dealer or Mr. Repairman listens to these kicks, but does he swear back? Seldom (audibly). He has expected this from you; he has had it from 95 per cent. of his customers before you, during their first few weeks' experience with their first car. You are so mad you will hardly let him explain to you that he had already cautioned you, for example, against the coming of cold weather; that your carbureter might need slight change in its adjustment; that you should use some kind of anti-freeze solution in your water circulating system a little before you expected freezing weather. You have forgotten he told you to oil certain joints or connections in this or that place; and that you should always keep your tires pumped up.

Have you, Mr. Owner, ever neglected any of these different things, or maybe all of them, and taken it out of some one's hide for your indiscretions? Be frank with yourselves, you owners of automobiles—'fess up; most of you have.

Have you been fair to the manufacturer? No, you have taken out your hammers and pounded him to a mass of jelly. Why? Because you are not fair with him or with yourselves. You, perchance, did not want it known that you were not proficient in taking care of your machine.

Results of Unfair "Knocking."

What have you done? Gone to your club, to your business, among friends and acquaintances, and told them what a bum car you have. The result is that the dealers and manufacturers, who are really your good friends, lose not only your business, but that of whomever you may have influenced against your particular make of car.

But suppose now, Mr. Owner, you are a man who can be convinced; that you have brought your car in, and Mr. Dealer or Repairman has convinced you that the trouble you have is your fault, what then? This may be the tenth time you have had this same trouble, and the dealer may feel it is time he began to make charges for time or parts. You refuse to pay the bill; say the trouble should not have happened; that: "My car has been run only one month, two or three months" (as the case may be), "and is practically, if not quite, a new car. Why should I pay? I am being 'done.'" But you do not stop to consider that you are presented with such bills because you have forgotten, or because you did not know. If so, why should Mr. Dealer or Mr. Repairman be held up for bills you justly owe?

Think this over, Mr. Owner. You may have had this charge made against you the fifth or tenth time you came in for your repairs (true, only slight, but they cost Mr. Dealer and Mr. Manufacturer something). But, Mr. Owner, did they charge you the first four times in one case, or the first nine times in another? Be honest now—have they not been very good to you—and in all justice should you not walk up to the desk and pay your bills? You owe it honestly; so be fair with the other fellow, and do not get out your hammer and start an anvil chorus, telling Mr. Dealer or Mr. Manufacturer that if he wants his money he can sue for it. Pay up, old man; they can't keep your car in shape indefinitely, with no charges being made against you.

Abuse of Machines.

By this time, Mr. Owner, you are thinking: "This does not mean me. My trouble was that I had a spring break while I was driving along a smooth boulevard." Of course, you did; but do you remember that, several days before, you drove over some very rough country roads, or ran your front wheel into a bad hole in the street? That was when your spring started to go; the weight of the car was too great for the remaining uninjured spring leaves, and the spring finally let go while you were driving on a good road. You may have your car overloaded to-day, or have had since the trouble started, but now is the time Mr. Manufacturer "gets his," because the spring gave out on a smooth street. You did not think of your overloaded car, or the bad roads, or the ride of the other day, did you, Mr. Owner? No. Well, don't lay it up against any one but yourself.

Tests by Manufacturers.

You say it was not a spring. It was a front axle. The same ride that broke the other fellow's spring may have been the cause of your broken axle. Don't kick too hard, Mr. Owner. The manufacturer has driven the first one, two and often three cars made, of this same model, many thousand miles, under conditions that at times were beyond reason. The axles on these cars did not bend. They had also been well tested.

Tinkeritis.

So I might go on down the line, and let me tell you right here, Mr. Owner, ninety-nine times out of a hundred, you are to blame. You have come back with the statement that you are a mechanical man; that you have had several cars and are experienced. Quite right. But do you have trouble? Yes? Well, perhaps you are troubled with "tinkeritis." It happens in nearly as many cases that an owner is troubled with this disease as that he does not know. A great many people are overzealous in attention to their machine. Let me tell you that the man with the "tinkeritis" habit is the hardest to deal with the auto man comes in contact with. Usually he *knows*. He does not give the repairman or the manufacturer or any of his experts the credit of being as well acquainted with machines as he himself.

What the American Maker Has Done.

Did you ever stop to think that the first American automobile was sold in 1898—less than eleven years ago? Do you remember what a crude looking machine it was? Not much like the present-day luxurious car. Was it you, Mr. Faultfinder, Mr. Knocker, or Mr. Tinkeritis, who brought about this wonderful change? No, it was the manufacturer and the men whom you have kicked against.

Let me tell you there are not twenty automobile manufacturers who have made a large amount of money, and they only from the fact of having done an enormous business. The successful manufacturer's profits have been no more per piece than the

manufacturer who has barely kept his nose above water, but the former had the advantage of a large business. Why, then, should he charge less for his parts, if this is so. The amount of money lost by special machine tools, jigs and fixtures becoming obsolete is almost unbelievable.

Extensive Experimentation by Manufacturers.

Is the disgruntled man who is always saying that this or that manufacturer does not know his business, does not know how to build an automobile because he did not put such and such a mechanism on his latest model, and who always the the proper solution for making such models better, aware that the manufacturer against whom he is kicking, for not having these certain devices, was in the majority of cases the first maker to use the device he is howling about; that the manufacturer tried it long ago and found it inferior, a detriment rather than the valuable asset you believe it? Are you aware that the older and larger manufacturers have expensive experimental rooms and laboratories to keep up, and that they are continually building motors and cars that are never put on the market; that they are building new devices of all descriptions, hoping to get some strong feature that will be of immense service to you in your pleasure? In these laboratories dozens of coils, magnetos, timers, carbureters and other accessories are tried, not for an hour or a day, but for months. All this is done, Mr. Owner, that you may have the enjoyment that comes of a first-class car; and the manufacturer is giving you just what you are looking for—a first-class car. In fact, he is giving you a mechanical production that is far superior to anything that is a means of locomotion.

Mechanical Status and Burden of the Automobile.

Remember that your automobile travels under the vilest conditions, is handled brutally at times, yet gives you continually dollar for dollar in value, if it is handled and cared for with a reasonable amount of intelligence. The manufacturer is entitled to the credit of giving you a good, high-class automobile; and he has done it in less than eleven years.

Take the next best in locomotion—the locomotive. Have we built up in seventy-five years a locomotive that can compare with this eleven-year old child? No. How many of you have boasted that you have taken your beloved wives, children and friends on trips from one to four thousand miles and never touched a wrench to your car from the time you started until you returned? Could you ride behind a locomotive, of which most of us are proud, without a wrench being used on it in a like number of miles? I guess not.

Incompetent Chauffeurs.

Let me caution the man who hires a low-salaried chauffeur. The cheap man is the curse of the industry. The manufacturer pays big wages to turn out a high-class finished product. Why, then (if you must have a driver), do you hire a cheap man to destroy the machine of excellence? You may rest assured that if this man whom you are paying low wages is a valuable man he would be getting the top-notch wage. He would go after it, as any other man would reach out for the best. You may believe you are saving money with your cheap man. But let me tell you he is taking the life out of your car very rapidly, and the money from your coffers more rapidly still. Stop going around to your dealer or manufacturer, telling them your troubles; that they should make good this or that thing on your car. It is not their fault; you are to blame; you have a cheap man on your car.

The Local Expert and Factory Work.

We know the man who writes to the factory: "Your repairs were received and were not right. We have the best automobile expert in the State in our town, and he says this and that part is wrong," etc." Ought he to be the arbiter, Mr. Owner? He may look after or be familiar with from five to twenty-five different makes of cars. Can he be proficient on all of them? Well, hardly; maybe on none of them. The manufacturer, on the other hand, has his men trained for one make of machine, of his manufacture. You may be very sure that when your repairs come back to you they are about right. The men in the factory repair department are not men who are here to-day and somewhere else to-morrow. They are usually men of some years' standing with their company; not only that, but they usually know their business.

Who's to Blame.

Now, Mr. Manufacturer, are you to blame? I really believe that you seldom are. You know that Mr. Knocker is wrong, because you have the names of hundreds of customers who are driving with the best results the same type machine that is complained of. Perhaps the satisfied users have had more trouble than Mr. Knocker, only they know what a machine should do.

Garage and Factory Complaints.

You, too, Mr. Faultfinder, when you go to a garage, do not try to have the men get your car out ahead of the four or five other customers waiting for theirs. They are just as important as you. Do not stamp around and make every one feel unpleasant, as no one is to blame because you came in a little later than some one else and have a wait a few minutes.

Let me say that when you, Mr. Owner (who may be the big noise in your locality), write to the manufacturer and ask him to send you a bill of goods, don't kick if they come to you C. O. D. The manufacturer has probably never heard of you.

An Ordinary Business Proposition.

Now, Mr. Owner, look the situation squarely in the face, size it up like any other business proposition, take into consideration that the automobile industry to date has produced less than twenty money-makers; that you have the best means of locomotion in the world, and you will see that the automobile manufacturer is not a grafter, all all, but a business man who is using every means at his command, from the smallest item up, whether it be his garage, manufacturing, repairing or selling departments, for your pleasure, as your pleasure means his business. You are the gainer, Mr. Owner, so why not be fair with the manufacturer? The manufacturer is not working a ten-cent game with a dollar come-back; he is giving value for every dollar received—a dollar value for every dollar you spend. So be fair with him. Learn to care for your car properly and it will then give you satisfaction.

TOLEDO DEALERS HAVE ORGANIZED.

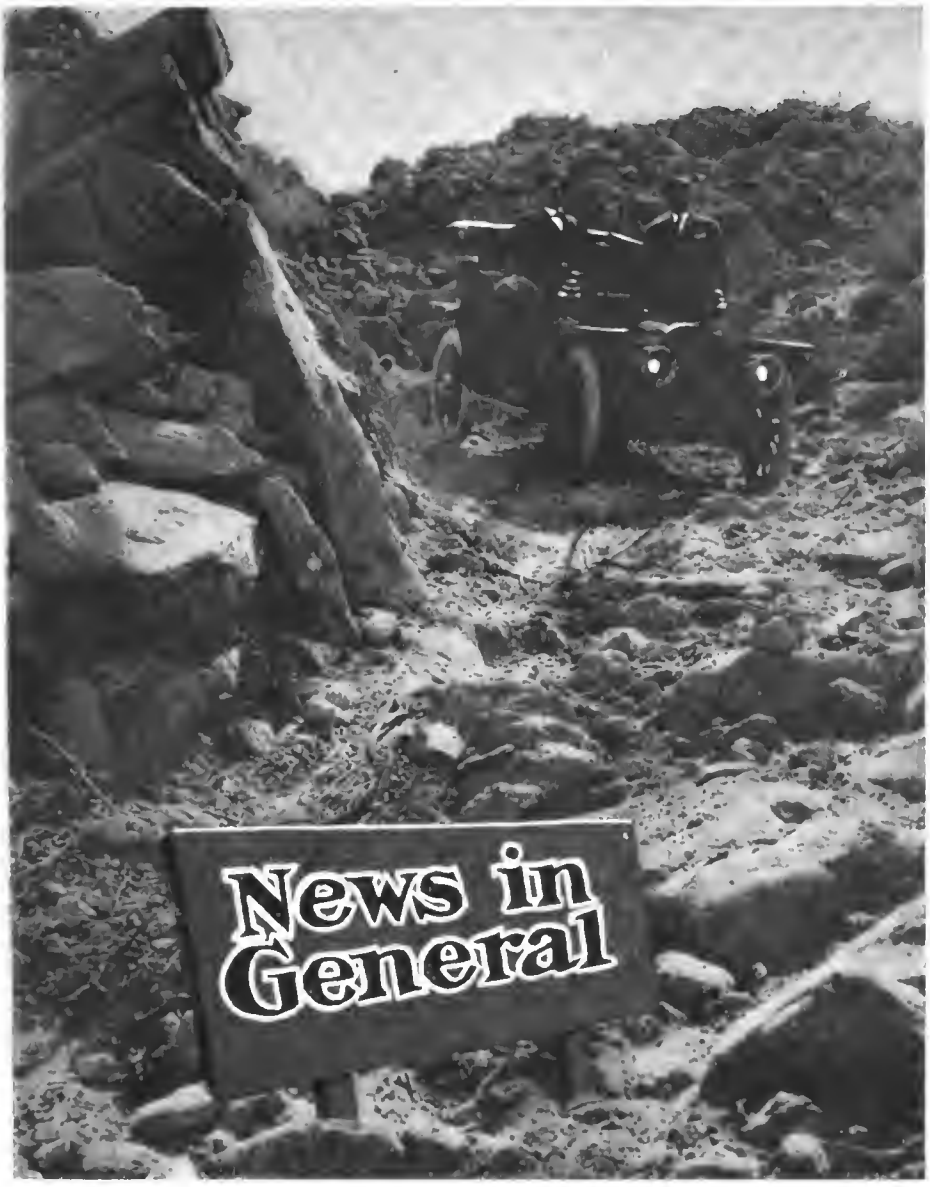
Toledo, O., Jan. 4.—Toledo automobile dealers are desirous of closer co-operation, and with this in view the Toledo Automobile Dealers' Association will shortly be incorporated, formal application having already been made. Sixteen local dealers have already subscribed the corporate stock, and practically every dealer has signified his willingness to unite in the organization.

Incorporators are: A. A. Atwood, W. H. McIntyre, E. A. Kirk, S. C. Fisk, J. G. Swindeman, A. W. Morris and B. O. Gamble. While the officers have not been chosen as yet, they will probably be: President, A. A. Atwood; vice-president, W. H. McIntyre; secretary, S. C. Fisk, and treasurer, E. A. Kirk, as this selection has been endorsed by the majority.

The organization of this association insures Toledo the largest and best automobile show she has ever had.

JAIL SENTENCE FOR GRAFTING JUSTICE.

Camden, N. J., Jan. 11.—Conrad Waldvogel, justice of the peace of Ancora, a small place near here, was sentenced to three months' imprisonment by Judge Jolinc to-day, on the charge of retaining for his personal use about $120 which he had collected from automobile owners for alleged violations of the speed laws. Waldvogel was arrested about a month ago, when it was discovered that fines amounting to $30 had not been turned over to the State, but because of his age and the fact that he is a Civil War veteran sentence was suspended. Later it became known that the amount involved was much greater than at first supposed, and he was rearrested, the case coming up for trial to-day.



A Typical Southern California Tour.

Franklin touring car going through Devil's Canyon in the southern part of California. Never before had a car on its own power taken this trip from San Diego, through the canyon, across a desert waste, and into the Imperial Valley and back again. The trip was taken by H. M. Willard, T. E. Patterson, and Wilson S. Smith, two of whom appear in the picture. The other is handling the camera.

Adirondacks Livery Service for Lozier.—The field of the automobile is being extended every day and in every direction. Some of these up-to-date extensions are surprising and some are more—startling, in fact. Very few visitors to Lake Placid in the Adirondacks ever expected to see the passing of the well-known buckboards, yet this is almost an established fact. Three years ago, when E. R. Lozier took a touring car up in the Adirondacks, the Summer visitors and residents of that locality considered the matter in the nature of a joke, as it was thought impossible to use an automobile in that section. In order to settle all doubts on this question, one of the first stunts undertaken was an excursion over one of the worst roads with eighteen of the youngsters from the Stevens House for a fifty-mile trip through the mountains. George Stevens, of the Stevens House, was so impressed that he ordered a duplicate car for his own use, and since that time the guests of the hotel have insisted upon renting this car for trips to the various points of interest, so that he has been unable to use the car for his own purpose. Now he will establish a rental agency and has just purchased two large seven-passenger Lozier cars for use the coming season.

Another European Invasion.—Negotiations for the purchase of three Mitchell cars, recently concluded, brought to light the fact that these were intended for a new and unique tour of Europe the coming Summer. This deal was put through by Victor Moore on the basis of a special delivery date. As planned by Mr. Moore, the touring party will include Mrs. Moore, Mr. and Mrs. George M. Cohan, Mr. and Mrs. Sam H. Harris, Mr. and Mrs. George W. Lederer and William Pinkerton. The automobiles will be shipped directly from the Racine factory to Paris, where a complement of expert chauffeurs who know all the prominent touring routes in France, Germany, Italy and other portions of the continent will be engaged. The Moore party will leave New York on the Lusitania about the middle of May and the continental start will be made from Paris about June 10. The limousine will be included in the appointments of this unique automobile train as a precaution against emergencies in districts that lack café accommodations, Shero, the Japanese servant of Mr. Moore, having signed to do the cooking.

Gabriel Will Invade Europe.—Owing to the fact that exhibitors of sundries will not make exhibits throughout the various shows in the United States after the National shows, it will be impossible for the Gabriel Horn Manufacturing Company of Cleveland to exhibit its immense instrument, containing 37 horns, and playing a full 3½ octaves. For this reason Mr. Foster has been deluged with offers from various promoters for the use of the horn with M. Lusk, the musical expert, as the operator. He has already made arrangements with Rochester, Kansas City and several other cities, and this big horn will be steadily employed from now until the close of the show season. At the conclusion of the season it is the intention of Mr. Foster to take the big horn to Europe, there to tour through England, France, Germany, Switzerland and Italy, in all of which countries the horn is very popular. Mr. Foster received from the Paris show alone orders for 550 horns, and recently filled an order for several thousand in London.

Says R. E. Olds: "Rarely does an automobilist realize the tremendous amount of painstaking detail that enters into the average automobile. I venture to say that very few owners of automobiles could guess within a thousand pieces that enter into their cars. By our systematic division of building and assembling the multitude of parts in every Reo we can instantly trace any defective part to the man at fault. Knowledge of this fact on the part of every mechanic whom we employ places him on his individual responsibility. This is true with every man from the foundry to the assembling department; to the testing tracks and trestles and finally to the experienced shipping crew whose duty it is to see that every car is properly blocked and crated before delivery is made to the transportation companies. This, in a measure, explains why every Reo car unloaded at its destination can be started with a half turn of the crankshaft and immediately run under its own power."

Body Builders Prosperous. — The Bridgeport Vehicle Company, one of the largest of the fine coach builders, which made Bridgeport, Conn., famous for this kind of work, has recently turned its attention to the construction of automobile bodies. So successful has it been in this line that the plant at Water street and South avenue has been outgrown. To provide for present and future needs ground has been broken at Fairfield and Holland avenues for a three-story brick building 88 by 160. This handsome structure is expected to be completed, ready for occupancy, July 1, when it is expected that the present force of seventy men will be doubled. The officers of the company, with a showroom for the displaying of six cars, will be in the Fairfield avenue side of the building. The concern will install its own power plant and an elevator. The officers of the company are: President and treasurer, Harry D. Miller; vice-president, H. F. Brandes; secretary, George C. Miller.

Growth of the Jackson.—President G. A. Matthews, of the Jackson Automobile Company, in speaking of the coming year, said: "During the last year we have erected and moved into one of the finest plants in the West. The new fac-

Rambler New York Branch.

The New York branch of Thomas B. Jeffery & Co. is located at 38-40 West Sixty-Second street, where the entire line of 1909 Ramblers are on exhibition and serve as a special attraction during the Garden show, the same as was the case during the Palace show. This company believes in having an exclusive show, and it would appear from the results claimed that it is a most satisfactory plan.

tory is located at Jackson, Mich. It utilizes 210,000 square feet of floor space, made up of a four-story building, 600x50 feet; a two-story building, 300x100 feet, and a drop forge shop of 30,000 square feet. The Jackson output this season will be 3,500 cars. The first of the 1909 cars appeared in September and 400 of them have already been shipped to agents. Present production is eighty-five per day, which early in the new year will be raised to 100. In the neighborhood of 1,500 men are employed, who work also four nights a week. We make practically the entire car, forgings, engine, bodies and wheels being manufactured at our big plant in Jackson."

A Continental Luncheon.—During the Grand Central Palace show one of the family trade luncheons was that of the Continental Caoutchouc Company, held in the Indian room at the Hotel Astor. Of course, there was a good deal of discussion of Continental tires and demountable rims, and the representatives and sales force expressed themselves interestingly and thoroughly, the summing up being of general all-around good. Joe M. Gilbert, the general manager, was the toastmaster of the occasion, the others present being the following: P. O. Eckhardt, J. H. Sheldon, S. S. Poor, J. B. Cothran, B. D. Hart, James L. Gibney, John Gibney, A. L. Risley, E. E. McMaster, James Patterson, E. L. Thompson, W. A. Wattenschedit, F. C. Robie, H. W. Lester and Messrs. Gray and Eccleston.

Motor 'Bus for Arctic Circle.—When a motor truck company can sell its goods on the same day to representatives of two different countries, where climatic conditions and the roads are radically different, it is a good demonstration of the fact that the general utility of the commercial vehicle has been proven beyond a doubt," said Morris Grabowsky, of the Rapid Motor Vehicle Company, of Pontiac, Mich. "On the same day that I sold five Rapids for use in Helsingfors, Finland, ninety miles from the Arctic Circle, I sold a sixteen-passenger 'bus to Rietz Horns, of Coronia, Spain. This 'bus goes by the first available boat and will be used in the extremely mountainous sections of the country."

Champion Cyclist Becomes an Autoist.—Frank L. Kramer, of East Orange, for the past eight years the champion cyclist of America, has become an autoist. During the recent Palace show he bought for immediate delivery a 1909 $2,000 40-horsepower Jackson runabout. The car will be Jackson green, upholstered in pigskin leather, and it is possible that the cycle champion may want to try his hand in various automobile contests.

Used the 1908 Maxwell-Briscoe.—In the advertisement of the Maxwell-Briscoe Motor Company which appeared in THE AUTOMOBILE of January 7 an illustration of a 1908 Maxwell model car was used in error in place of the model of the present year. The 1909 Model DA is fitted with a magneto, gas headlights and a generator as part of its regular equipment, which means a very substantial difference to the purchaser of a car.

A Continental Announcement.—The Continental Caoutchouc Co., 1788-90 Broadway, New York City, announces that all Honover interests formerly held in their company have been purchases, and hereafter Continental material will be marketed by American interests only.

Correction in Cameron Advertising.—On page 98 of the advertising section, December 24 issue, a typographical error gave the price of the Model 16 Cameron touring car as $1,000, when in reality at the correct price of $1,100 the makers are giving unusual value for the money.

IN AND ABOUT THE AGENCIES.

Franklin.—The H. H. Franklin Mfg. Company has appointed the following agents for the coming season: Trenton, N. J., Munro & Engle; Sharon, Pa., Fruit-Ohl Company; York, Pa., J. W. Richley; Charleston, W. Va., Charles E. Ward; Youngstown, O., Standard Auto Garage Company; South Bend, Ind., Otis Motor Car Company; Seattle, Wash., Seattle Automobile Company; San Antonio, Texas, Mark V. Haley; Beeville, Texas, Beeville Automobile Company; Shawnee, Okla., T. F. Bruber & Company; Shreveport, La., L. W. Huckins; Savannah, Ga., T. A. Bryson; Cocoa, Fla., S. F. Travis & Company.

San Francisco.—A number of automobile agencies have leased the property on Van Ness avenue, between Birch avenue and Fulton street, and will erect a one-story brick building to be used as a garage. Among the companies interested in the scheme are the Maxwell agency, the Mobile Carriage Company, the Pierce-Arrow agency, the Pacific Taxicab Company and the Continental Tire Company. The building is to be ready for occupancy early in March.

Western Agents Expand.—J. W. Leavitt & Company has leased for a term of years the large lot at Golden Gate avenue and Hyde street, San Francisco, and will erect a new building. This company is the agent for the Reo, Stoddard-Dayton and other well-known cars.

Rambler, Cleveland.—Thomas B. Jeffery & Company have opened a branch in Cleveland at 2558 East Ninth street in the quarters formerly occupied by the T. C. Whitcomb Automobile Company.

Oakland, Allentown, Pa.—The Lawfer Automobile Company has secured the agency for the Oakland car. This company was also recently appointed agent for the Chalmers-Detroit.

Studebaker, Pittsburg.—B. F. Benson has been appointed agent for the Studebaker car in Western Pennsylvania and will erect a garage on Craig street, near Luna Park.

Pope-Hartford, Kansas City, Mo.—H. Holzhauer has been appointed agent for the Pope car and will open headquarters on Grand avenue.

Knox, Philadelphia.—The North Philadelphia Auto Station at 3425 North Broad street has taken the agency for the Knox.

American Locomotive, Des Moines, Ia.—The agency for the American Locomotive has been taken by Grover Hubbell.

Jewell, Kansas City, Mo.—The Rhodes Implement Company has taken the agency for the Jewell line.

PERSONAL TRADE MENTION.

Carlton R. Mabley, one of the pioneers in the automobile industry, long and prominently identified with the importation of Panhard, Renault, Mercedes and other automobiles of note, during the palmy days when the firm of Smith & Mabley was a power in the trade, and the instigator in the organization of the Smith & Mabley Mfg. Company, now the Simplex Automobile Company, will take the general management of the Post Motor Company, 1620 Broadway, New York City, which will have the New York agency of the Hart-Kraft delivery wagons. Mr. Mabley was prominent in the exhibition at the Grand Central Palace, just brought to a successful termination.

Henry Souther.—Announcement is made that Henry Souther, the well-known engineer, has been secured by the Standard Roller Bearing Company, Philadelphia, to devote a large part of his time to its interests as consulting engineer. Mr. Souther's services have recently been employed to some extent by this company in this direction, and the above arrangement is the outcome of the results obtained in the betterment of its product.

Charles Schmidt, when interviewed recently regarding the report that he was to sever his connection with the Peerless Motor Car Company, said: "The last contract has several years still to run, and I feel no differently in the matter than at the time of signing it. My relations with this firm have always been of a very satisfactory nature, and I have no present or future intention of terminating this connection."

E. R. Thomas, of the E. R. Thomas Motor Company, Buffalo, accompanied by Mrs. Thomas and their daughter, last week sailed for an extended European trip. Mr. Thomas said before sailing that it was the first vacation he had had in many years, but he went away with the comfortable feeling that the industry was assured of the most satisfactory season since its beginning.

Alfred Reeves, general manager of the A. M. C. M. A., this week is enjoying a well-earned rest at Atlantic City, whither he and F. J. Wagner went on Saturday last accompanied by their families. L. M. Bradley, the general manager's assistant, is visiting his old home in Worcester, Mass.

William F. Legg, a graduate of Cornell University and formerly with the E. R. Thomas Motor Car Company, Thomas B. Jeffery Company and the St. Louis Car Company, has taken charge of the factory of the Carter Motor Car Corporation at Hyattsville, Ind., as superintendent.

Added to the E-M-F.—Two more "leads" and one understudy have been added to the E-M-F organization. These are James Heaslet, whose title is chief engineer, and Harry L. Cunningham, who has assumed management of the E-M-F company's Detroit retail branch

Archie McLachlan, who has been in charge of the Chicago branch of the Royal Tourist Company for the past six months, is to return to Cleveland, where he will take up his former duties as sales manager of the Royal Tourist Company.

W. W. Partridge, formerly at the Stearns factory, has joined the sales force of the Tebean Motor Car Company, which has the Kansas City agency for the Stearns car.

SOME BUSINESS CHANGES.

Powell Supply Company, Omaha, Neb.—This is the new name since January 1 of the former Powell Automobile Company of Omaha, Neb. On that date, also, they removed from 2010 Farnam street to 2020-2022 Farnam street, where they will have about three times the floor space previously available. The change in name was made because it was a misnomer, the company never having handled cars, but devoted itself to supplies exclusively.

Utility Company, New York City.—The Utility Company, 636 West Forty-fourth street, New York City, manufacturers of the "U K O" mica spark plug, have taken over the business and goodwill of the spark plug department of the Richardson Engineering Co., Hartford. Its plug was called the "Rich-Spark" and followed the "U K O" closely in general design.

Cameron Sales Company, Beverly, Mass.—The general sales offices of the Cameron Car Company of Beverly, Mass., manufacturers of the well-known air-cooled cars, have been taken over by the recently organized selling agents, the Cameron Motor Company, of New York. All correspondence relative to sales should be addressed to the offices at 231 West Fifty-fourth street, New York City.

Top Companies Consolidate.—The L. L. Lamen Auto Top Company and the Iroquois Auto Top Company, of Utica, N. Y., have consolidated and in the future will do business under the latter name.

BUSINESS TROUBLES.

New York City.—A petition in bankruptcy has been filed against the Automobile Coaching Company, of 147 Spring street, in which it was alleged that they made an assignment on December 1 and transferred $3,000 worth of assets. This petition was filed by Louis Ginsberg as administrator of the estate of David Ginsberg on a claim of $2,361 judgment obtained May 22, 1908, for the death of David Ginsberg. Schedules in the assignment filed recently show liabilities of $13,531, nominal assets of $80, and actual assets of $24.

NEWS OF THE GARAGES.

Bridgeport, Conn.—It is announced that the garage and agency business of the Blue Ribbon Auto and Carriage Company has passed into the hands of a new company, and will hereafter be known as the Blue Ribbon Garage. The latter will continue the agencies maintained by the former, which include the Packard, Cadillac and Franklin cars.

Hartford, Conn.—R. D. & C. O. Britton, local representatives of the Maxwell and the Stoddard-Dayton, have practically completed their remodeled garage on Allyn street and are now moving in. The concern will now be in a position to care for the increasing trade. The outlook for both cars is very good.

New York City.—The Riverside Garage Company announce the opening of a new garage at 202 West One Hundred and First street, New York City. The building is new and absolutely fireproof, with floor space for 200 cars.

Hutchison, Kan.—This town is to have a new and up-to-date garage. The Taylor Motor Car Company has leased the new structure at 29-31 East Sherman avenue, which is to be 50x150 feet.

Prady, Tex.—Sheridan & Wade, who are starting in the automobile business, have leased a large lot near the post-office and will erect a garage.

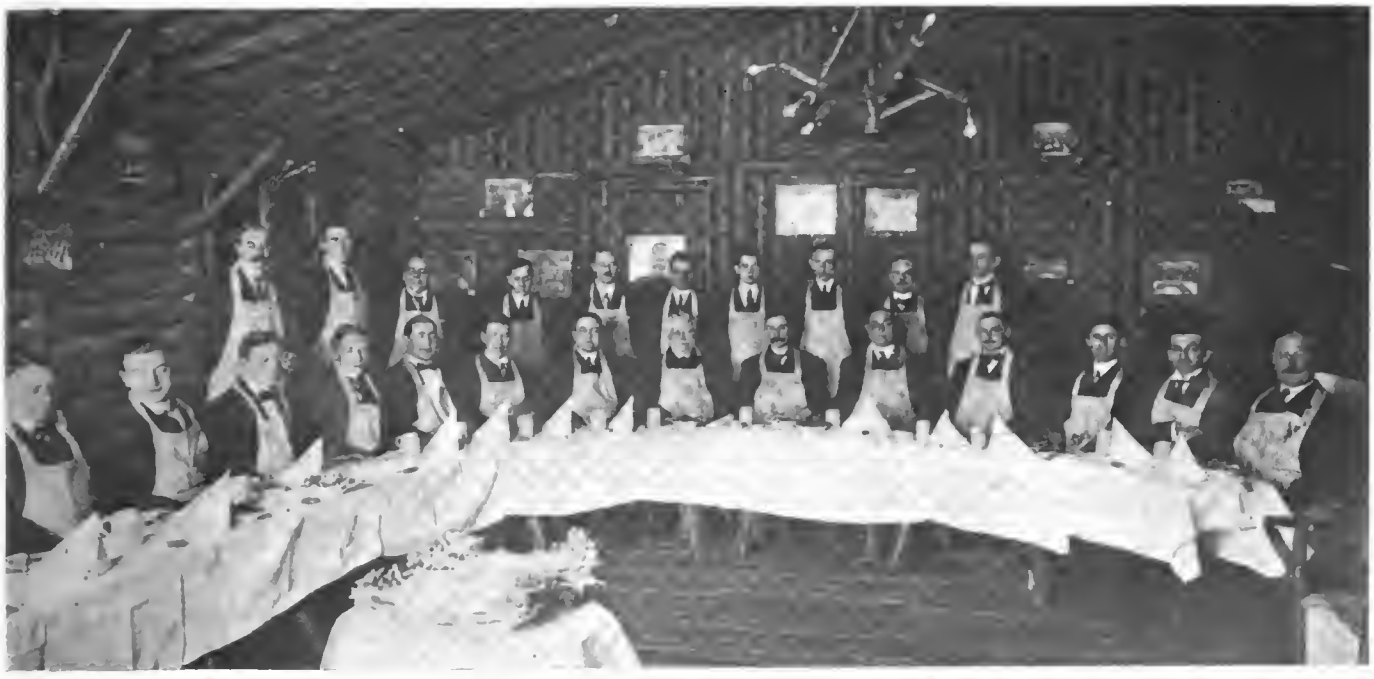
Philadelphia.—W. H. Schofield & Son has opened the New Camac Garage at 250 South Camac street.

JONES SPEEDOMETER DINNER.

Saturday night, January 9, the New York representatives of the Jones Speedometer Company gave a beefsteak dinner in Healey's "Log Cabin," at Broadway and Sixty-sixth streets, to a few friends and out-of-town Jones agents who were in the city. All discussion of a business nature was tabooed, the occasion being simply a social gathering, with everyone doing full justice to the ample layout provided.

The list of guests included Gaston Plantiff, manager of the New York branch of the Ford Motor Company; Col. K. C. Pardee, of the Maxwell-Briscoe Company; G. A. Wahlgreen, Denver; C. O. Sacks, president Rowland Advertising Company; J. A. Clark, Peerless Motor Car Company; E. B. Jackson, of the Packard Motor Car Company, and Harvey Adams, of the Auto Supply Company. Among the Jones representatives were General Manager G. L. Holmes and Sales Manager E. P. Nussbaum, of the New York branch; F. G. Dwight, manager of the Philadelphia branch, and R. C. Peet, Western representative.

The others present were: F. H. McFarland, W. J. Turp, A. C. Nichols, A. W. Owen, W. C. Boome, Thomas Boome, C. A. Kline, P. S. Barrett, Mr. Steckle and A. C. Howell, whose introductions of the speakers were a feature of the function.



Jones Speedometer Representatives and Friends Enjoying Beefsteak Dinner at Healy's "Log Cabin," New York City.

TAXICAB AND TRANSIT.

New Cab Service.—It is said that a prominent automobile manufacturer is backing the project to start a taxicab service over the Queensboro Bridge, New York City, as soon as it is open to traffic. It is likely that it will be a year or more after the opening of the bridge before the trolleys are running, and an auto service would prove very profitable as well as convenient. The New York and Queens County Railroad is willing to allow the service.

Wyandotte, Mich.—Edwin A. George and G. W. Blake, both of this city, are the backers of an auto express service which is to be maintained between Detroit and western suburban points, including River Rouge, Delray, Wyandotte, Trenton and other adjacent territory. A number of Grabowsky power wagons are to be used, and a central collecting station is to be maintained in Detroit. The service will probably start February 1.

Four Wheel Drive Auto for Duluth.—The Four Traction Auto Company of Mankato, Minn., has received the contract for a police patrol to be delivered to the city of Duluth. This product has a three-speed transmission, which delivers power to all four wheels, which superior traction will be necessary on the city's bad hills. The body will be equipped with an ambulance outfit comprising stretcher and Red Cross outfit.

Schenectady, N. Y.—The Winter schedule of the P. R. & S. Transportation Company has been discontinued and will not be resumed until suitable Winter tops can be secured for the machines. Specifications are now being prepared for regular Winter cars, and it is also the intention of the company to put on three new cars in the Spring. It is likely, also, that lines will be started to South Schenectady and Burnt Hills.

Pittsburg, Pa.—J. L. Shearer, Jr., of Harrisburg, who was one of the prime movers in the organization of the taxicab service there, is interested in the formation of a similar concern here. Application for a broad charter will be made, and the city will be covered by an extensive system. There will, however, be no connection between the two companies.

Asbury Park, N. J.—A taxicab company is being organized here to maintain an all-the-year-round service at the leading hotels. Among those interested in the company, which has a $25,000 capitalization, are Michael E. Sexton, Milan Ross, Dr. T. H. Pratt, and others. In the Winter time a central station service will take the place of the more numerous Summer stands.

Los Angeles, Cal.—F. M. Hoblitt, who is representing the American Berliet Locomotive Company, is looking over the local field with the intention of running an automobile freight line from this city to Wilmington, Cal. A regular schedule is to be maintained and a company will be organized to look after the business at this end of the line.

Lexington, Ky.—The Phœnix Garage Company has completed arrangements for a cab service here to begin March 1. These cabs have been ordered by the company, who will have their headquarters in the Phœnix Hotel Building. The fares charged and taxameters used will be the same as those used in New York City.

Marshfield, Ore.—William Wade and Thomas Goodale, of Marshfield, Ore., have formed a partnership to start an auto 'bus line between that city and Roseburg, a distance of 65 miles. They have purchased three eight-passenger Thomas cars, which will be put into service at once.

Hartford, Conn.—A taxicab line will be inaugurated by R. D. & C. O. Britton, local Maxwell agents. Four-cylinder Maxwell chasses will be used for the purpose. At present there is nothing of this sort in service, though several liverymen have done a good trade in motoring livery.

Pittsburg.—Application will shortly be made for a charter for a new concern, to be known as the Pittsburg Taxicab Company, which is to run a general taxicab business. Weil & Thorpe are the solicitors.

Allentown, Pa.—Arthur A. Barber is to go into the auto livery business the first of the year. He has prepared to make his headquarters with the Berwin Automobile Company on North Eighth street.

Los Angeles, Cal.—The Needles-Parker Transportation Company has establishel an auto 'bus line between Needles and Parker, which will maintain a regular schedule in conjunction with the Santa Fe Railway.

Wilkes-Barre, Pa.—The Scranton Automobile Company will install a taxicab service in Wilkes-Barre beginning January 1, a satisfactory arrangement having been made with the Posten Transfer Company.

New Bedford, Mass.—A taxicab service will be established on January 1, using the same cab and taximeter now used in Boston, the charges for the services being similar.

Philadelphia.—Application is to be made for a charter for a new company, to be known as the Theobald Motor Car Company, which will deal in motor cars and accessories.

RECENT INCORPORATIONS.

The Northern Motor Car Company, Detroit, Mich., has filed articles at Lansing decreasing its capital stock from $500,000 to $1,000. The Northern Motor Car Company has been practically dissolved since the consolidation with the E.-M.-F. Company, but the nominal capital will keep the concern in existence until all debts are paid.

Winchester Automobile Company Winchester, Mass., capital stock $10,000, and will do a general automobile business. Incorporators: C. E. Tedford, of Boston, who is president, and George O. Fogg, of Winchester, treasurer.

Manhattan and Essex Auto Express Company, Newark, N. J., capital stock $100,000, and will do a general transportation business. Incorporators: O. M. Jackson, C. M. Hammell, Newark, and V. S. Richardson, of East Orange.

Worthington Clark Automobile Company, Fond du Lac, Wis., capital $20,000. Those interested are G. W. Worthington, E. N. Clark, George W. Stanchfield and others.

The Tourist Auto Car Company, Niagara Falls, N. Y., capital stock $10,000, and will operate and rent automobiles. Incorporators: J. H. Bridges, E. N. Wheeler and S. C. Fagard.

New Haven Taxicab Company, New Haven, Conn.—Capital stock, $25,000. George G., Peter C. and Robert G. Nesbit.

NEW INCORPORATIONS.

Savoy Auto and Taximeter Cab Company, Far Rockaway, N. Y., to run a taxicab service in the Rockaways. The incorporators and officers are: President, M. Katz; vice-president, L. T. Walter, Jr.; secretary, R. S. Smith; treasurer, F. Fitter, Jr.

Nightingale Whistle Manufacturing Company, New York City.—Capital stock, $1,000. Will manufacture whistles for automobiles and motors, tire inflaters, air compressors, etc. Incorporators: G. Stoddard, E. L. Keer and E. H. Carpenter.

Kennedy Ideal Carbureter Company, Boston.—Capital stock, $25,000. Will do a general automobile business. Incorporators: J. C. Kennedy, of Newton, who is the president, and W. E. Spear, of Boston, treasurer.

Marathon Automobile and Garage Company, New York City.—Capital stock, $1,000. Will do a garage and storage business. Incorporators: R. G. Berillc, W. C. Wyckoff and P. G. Chedbum.

American Motor Cycle Company, Chicago, capital stock $15,000, will manufacture and deal in motorcycles and automobiles. Incorporators: W. H. Hess and A. J. Musselman.

Model Automobile and Garage Company, Belleville, Ill., capital stock $2,000, to operate a garage and manufacture autos and accessories. Incorporators: Joseph and E. L. Schwarz.

Dillard Delivery Company, Brooklyn, N. Y.—Capital stock, $2,000. Will manufacture wagons, carriages and automobiles. Incorporators: J. A. Dillard, H. B. Lyons and O. F. Fix.

Scientific Research Company, New York City.—Capital stock, $100,000. Will manufacture automobiles, motor boats, etc. Incorporators: A. E. Ranney, A. M. Day and A. J. Robinson.

Summit Motor Car Company, Summit, N. J., capital $5,000, to manufacture automobiles, bicycles and supplies. H. H. Day, Harry Baldwin and Rosalie Nelson are the incorporators.

Lake Avenue Auto Company, Cleveland, to do a garage and jobbing business. President, James Fleming; vice-president, John C. McLean; secretary, Albert Redmond.

Juruick Auto Company, Brooklyn, N. Y., capital stock, $5,000. Will manufacture automobiles, etc. Incorporators: M. F. Juruick, L. R. Smith and Anne Juruick.

Carl Klemp Company, Chicago.—Capital stock, $2,100. Will manufacture automobiles and accessories. Incorporators: Carl Klemp, H. T. Kett and T. E. Rooney.

Vanguard Mfg. Company, Joliet, Ill.—Capital $25,000, will manufacture automobiles and accessories. Incorporators: C. F. Jensen, C. N. Steinhart and N. L. Hurd.

Overland Automobile Sales Company, Oklahoma City, capital $10,000. Incorporators: Jerome Harrington, Will G. Brown and Alta E. Funk.

Cory Motor Car Company, Oklahoma City, capital $25,000. Incorporators: C. P. Cory, C. D. Crouch, W. E. Crouch and W. L. Peck.

Western Reserve Motor Car Company, Cleveland, capital $50,000. John H. Price is interested.

Automobile Motor Boat Company, Jefferson, O., capital $10,000.

VOL. XX NEW YORK—THURSDAY, JANUARY 21, 1909—CHICAGO No. 3

THE AUTOMOBILE

Garden Show Undeniably Gratifying

Artistic and Impressive

Attendance Indicates Interest

AMERICA'S automobile industry is in its tenth year. To the man who saw it in its swaddling clothes, noted when it began to creep, next how it actually walked, and finally experieneed elation at its exultant strides, there is much that is gratifying and impressive in this ninth exhibition of motor-driven vehieles in Madison Square Garden. The ehapters that will follow in automobile history will be more gradually accumulated and possibly with less blaring of trumpets and still just as adequately satisfying. While it is unquestionably true that the greater part of the firms occupying spaces in the Garden do not produce what are termed "popular" ears, the fact is plainly evident that these confidence-inviting coneerns are assured of a prosperous year, in the conelusion of which there will be little, if any, of their outputs still seeking 1909 customers. The fear that is expressed by many is that the prosperity of the moment may eause undue preparations for another year, whieh might then exceed the figures eomputed in this present period of roseate hue. One's optimism should always have a safety valve at hand.

Unpropitious weather and ice-bound streets, as if the storms of the universe came to see the beginning of the show, ushered in the opening Saturday night, January 16, bringing along the whirl of the wind and the scenery of the poles. Despite all the inclemency that the weather heaped up, the A. L. A. M. show started in a swirl of glory, for the patrons of the industry were there in foree to witness the very sight that some have it erossed the line of vision of George B. Selden in the year

Where Tired Patrons Find Rest from Labors.

1879. This single model of that year would scarcely feel at home in the company now strewn around the big building, unless it is that age lends vigor and the right to glory in the improvements wrought.

Tremendous as the development is, as the evidence at the Garden amply indicates, it is not so great as to blind the men who did the work and stood the brunt of the fiercest battles to the fact that back of the show is the force which made it possible, and that this same force must be added to as time wears on. This force is not alone in the cars at the Garden, nor is it concentrated at the shops in which the cars were turned out. It is the combination of the cars, the shops, and the patrons of the industry.

After the first night, which was a typical first night according to the fashion "Manhattan," the patrons were of the class who come to see what the "craft" has to offer by way of improvements and as a result of the experiences of a year before, which must go down in history as a world-beater from the point of view of "hard" money and a big scare for every business but the automobile. Why the automobile should have side-stepped the drubbing is a question never to be understood by anyone outside of the charmed circle, if indeed the wise of th fraternity may not go a ltitle astray when it comes to a clear statement of fact.

Whatever the reason, laying aside all the pros and cons, it is still to be seen that the A. L. A. M. has been a power in the trade which can be looked upon as a "balance-wheel" of no mean purport. That the trade needed a "leveler" may not be realized to its fullest force, merely because the ship of fortune "docked" on time and in its hold were found all the voyagers in good financial health. Likewise it is to note that the buyers of cars, the absorbers of the product, toe the scratch with a glow of good health in their cheeks and an eye sparkling which is not the property of a fagged-out "hasbeen."

This Gives Idea of Garden's Attractiveness.

The former supporters of the industry, during the days when men of ordinary means or business acumen declined to risk a purchase, made bold to visit the haunts of their earlier exploits, and as a result it is pleasant to note that "Society" went to the show. There is no denying the fact that the automobile industry owes much to the earlier buyers of cars, buyers who paid a large price for what they received in turn, and at a time when the industry was much in need of "extravagant" methods; the extravagance, of course, coming mostly from the patrons of the industry. It is therefore a duty, as well as a pleasure, to report the continued interest of the very supporters of what was but an infant industry within ten years.

In view of the fact that the trend of the industry is adequately discussed elsewhere in THE AUTOMOBILE, it will be more to the point to confine the introductory matter to the features at the Garden as they intercept the eye of the visitor. One of the main schemes was to render the appearance of the show less crowded than was the case formerly. It is conceded that the plan was such as to lend color to the scheme. Then it was desired to prevent "bunching" of the visitors, as was the case in some of the earlier exhibits, due to placing the cars in such a way that the ones the visitors took the most interest in were in close proximity to each other.

By spreading the cars out in such a way as to prevent "bunching," it was also possible to do justice to all. It is a fact that interest ofttimes lies in what may be called an obscure exhibition, and the patrons will miss the very car they would be delighted to see under the old plan. Then the arrangement this year was by way of greater chance of seeing the cars. True, it is not uncommon to hear some of the spectators express the opinion that many go to the Garden to see many more. Supposing they do, it is also a fact that they go to see the cars, and it is of the greatest advantage to enable them to have a look, and a good one at that.

The crowd has been coming since the opening night, and each day the attendance figures have increased until the Garden capacity was only obtainable through increased compression. The wise man visits the Garden early, though he seems to find that other wise men have preceded him in generous quantities. All in all, it is a reassuring show and one that marks another epoch in the automobile's progress.

These statistics of the Garden show tell a story which will be most interesting to the man who delights in figures:

Gasoline.		Commercial.		Electrics.	
Complete cars	117	Complete cars	19	Complete cars	37

Madison Avenue End of the Garden as Seen at Night When the Electric Lights Lend Their Splendor.

the absence of complicated landmarks which makes one look again. At all events, the sight is one of simplicity in fact, since of valves there are none; gears and camshafts, as well as the bearings and the trinkets to go with them, of course are also absent. It is a simple plant, the Elmore—and it works.

In some cases the makers of cars are famous for the ingenuity they display in defeating mechanical incongruities. Then there are the designers who evolve distinctive features, while once in a while it is to find a company whose product is noted for its strict conformity to the conventions. Stop at the exhibition of the E-M-F. It might be said that if there is nothing unusual about this product, there is nothing unusual to describe. Walk around the circle, gaze upon the project at another angle, and what will be the conclusion? There is but one! the conclusion is that the whole thing is unusual. In this product will be found the pyramided experience of the designers of the world; rejecting ideas however good if perchance they fail to make for smooth construction. In this way, taking good advantage of things as they fall from the lap of experience, merit is assured, and it is this same virtue which is to be found in the cars of 1909, to the exclusion of the things, lacking.

But the phase changes. A look at the illustrations of some of the pioneer cars will locate the Franklin. A look in the Garden will also disclose the Franklin, and, strange as it may seem, it has undergone less change than any other type of car. True, the little Franklin of 1903, as illustrated, is not so much of a car as the modern products from the same plant, yet even so it is a fact that the resemblance is there, and it is with the air-cooled motor, somewhat altered as to detail, but holding its own in a sea of motors of the other kinds. In the modern motor, of the Franklin make, one discovers the introduction of "concentric" valves, means for quickly disposing of the products of combustion, and all the refinements in point of materials and in design as well to be had by any designer of the keenness of perception of the power behind the Franklin. Owing to the skepticism of the autoists who have hearsay evidence of the performance of air-cooled motors, let us take a ride in the Franklin "six." The side entrance of the tonneau is so ample as to lend the impression of entering some grand arcade, the feet contact with "linoleum," and as we sink into the cushions of the ample seat, it is suggestive of luxury, crowned with hand-buffed leather of the finest grade; the suggestion becomes a reality. The chauffeur, evidently pleased with life, cranks the motor—no, he starts on the spark. Off brakes, in clutch; away we go, free as a bird, careless of the future, alive to but one fact, and that is by way of full assurance of entire competence. Moreover, it is rendered plain that the "armored wood frame" is not only competent, but it is resilient.

Having returned to the Garden, in quest of further information, the eye intercepts the peculiar transmission on the Haynes Model X car, the lines of which are so good as to compel notice. The bevel drive usual in cars is here absent, and in its stead will be found the Haynes roller pinion and sprocket. Wiseacres, in the past, said it would not work, but it has been working so long and so well that it will stand a little study. Instead of the customary bevel gear, as before stated, the idea embraces the combination of a driving shaft with two integral flanges, spaced about one inch apart. At equidistant points on the pitch line, roller pins are placed and rollers are slipped over them. The engaging member is a specially devised sprocket, which by means of the teeth thereon engages the rollers and acts to the same end as a bevel gearset. The plan works exceedingly well, and of noise there is none; even the rumble, usual to bevel gears, is absent in the Haynes plan. The control of the car is along lines to accomplish the purpose, and in divers ways the car would support far more attention than can be given.

On the way up from the basement of the Garden when time was short, notice was taken of the Hewitt product. Investiga-

tion disclosed a modern truck chassis of the conventional Hewitt design, in which all is for stability and low cost of maintenance, even in the hands of the class of men to whom trucks must be entrusted. But the writer happens to know more interesting things about the same product, as, for illustration, it is a Hewitt "coal" truck which will be seen day after day in the streets of New York City hauling more coal in a given time, on a basis of a lower cost per ton mile, than any coal man ever before heard of, and the steady reliability of the service is a marvel.

Speaking of trucks, there is the Knox line, and also of the same company's product, it will be well to examine into the pleasure vehicles while at the Garden. Let us have a look at the Model O, which is a four-cylinder car of some pretence, borne out by closer acquaintance, due in no small measure to the use of fine materials coupled with taste in design, which did not defeat symmetry; nor is strength lacking. With the cover of the gear box off, it is opportune to look at the gears, and it will be noticed that the materials have a peculiar yellowish color, which with an appearance of "close grain" is a good indication of the use of "chrome nickel steel," and this is what the gears are made of. The straight-line drive to the floating-type live rear axle is at once noticeable, and along the line evidences of refinement are as outcroppings.

Of absorbing interest is the Palmer & Singer show. This company has a comparatively new line of cars of its own, and as sole distributors for the "Simplex" it is known to fame in company with pioneers. The Simplex is so well known as to require no heralding at all. It was a Simplex that held "fourth" place in the first Vanderbilt race, driven by Frank Croker, and originally Simplex cars were intended to defeat the importation of the better makes of foreign cars by the simple process of *actual* superiority at a lower price. When the Palmer & Singer interests took hold, it was found that the market was far greater than the output of the builders, and the Palmer & Singer was added in order to be able to supply a greater portion of the demand. The Skimabout, of the P & S line, was quickly snapped up by the buyers of cars, and later the company added the "6-60," which as the characters indicate is a six-cylinder car, rated at 60 horsepower.

Speaking of the Vanderbilt race it reminds one of the Locomobile, and the performance of the "racer" in the last race. In the meantime it will be a good idea to go to the Locomobile exhibit, and see what a year has done for the company. This is one of the companies which held to the side-chain drive for years, and it will come as a surprise to many to learn that the company now has a "shaft drive" car; a 30-horsepower model, embodying all the 1909 features known to be of value in this type of car. One point of unusual merit lies in the use of distance rods as they ordinarily obtain in side-chain drives, and in this way parallelism is maintained with the same degree of certainty as is the case in the side chain drives. Before departing from the Locomobile, it will be a good idea to note one or two of the innovations that go to render flexibility assured. The spring perches will be found free to rotate, and the springs will not have to sustain any part of the torsional load. This may not seem to be a matter of great moment, yet even so it is just such matters that have to be looked after if it is desired to keep to the shaft drive and not put up with "pinching" of the members that hold in their makeup what is known as relative motion. In the new Locomobile all these matters were given the ample attention they deserve, and the result is, as one would suppose, the shaft drive is quite as free from objections as any car can be.

In the same way it might be observed that the Lozier products are now of the shaft drive exclusively, and in the new cars of the line there is the absence of torsion rods. When the car is loaded the propeller shaft is horizontal, and the use of alloy steel is in evidence. But the most important detail of the Lozier

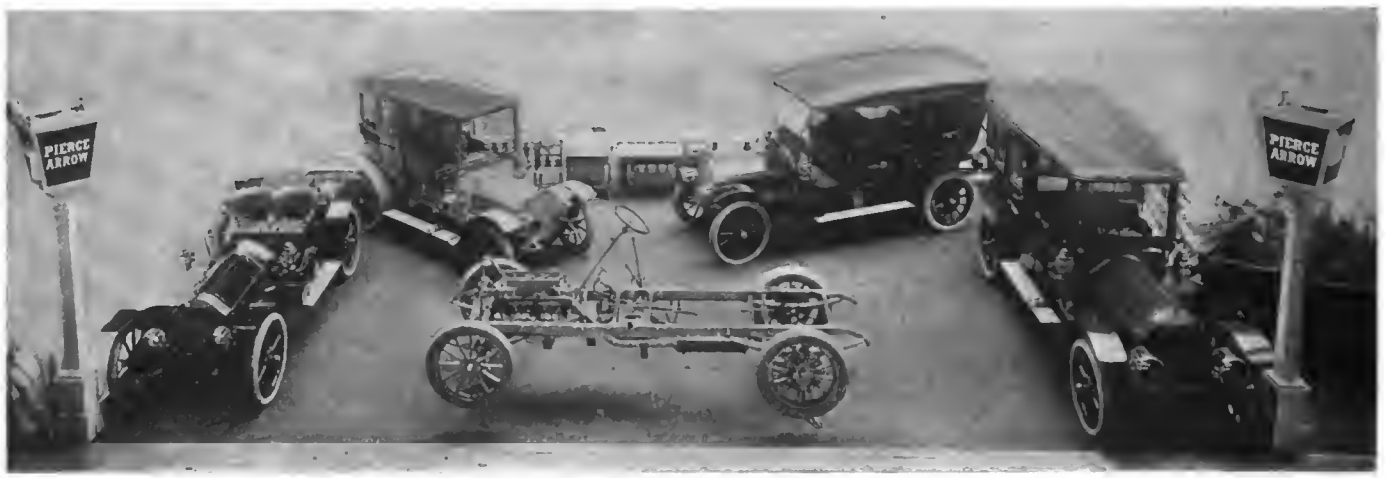
The Garden at Night as Seen When Looking Toward the East or Fourth Avenue End of the Building.

is yet to be noted: look into the crankcase and there note the shaft. It is of the ball bearing type, and it is not new. This type of crankshaft has been in use on Lozier cars for some years, and, contrary to the "blatter" of the mob, it works fine. Whether there is any chance of ball bearing crankshafts giving trouble, if the workmanship is poor, is another question; the Lozier work is the kind which augurs for success anyway.

By way of a digression, let us take a trip to the "Giant's Despair," sit on a boulder by the roadside, get a breath after the tedious climb, await the passing of events. In the distance the soft purr-r-r-r-r of a powerful automobile will be heard, it is coming nearer—nearer-er-er. The grade is masterly, the road is not wide, the conditions are such as to make one imagine that if an automobile should come that way, the manifestation will be as a chug—a long interval—another interval—another chug. The time for dreaming is short, the purr-r-r becomes more pronounced, the car bursts into sight; it is there, it is gone. Matheson! Better stop at this stand at this show.

Instead of returning to the Garden, let us go to the plant of the Packard; it is in Detroit. To tell how big it is in ordinary terms means so little that an attempt will not be made. The Society of Automobile Engineers was conducted through the plant last Summer, and after walking for the better part of a half day the plant was half done. True, it was the idea to be able to see things as they are done at the Packard, and the opportunity was adequately afforded. The output may not have been quite $10,000,000. The manner in which the task is performed is quite as leisurely—on the surface—as anything can be. To the skilled eye, it was the masterly system of the company that made haste without making waste. The laboratory in which the metallurgist ascertained the qualities of the materials used in Packards was probably the best indication of the real merit of the cars that could be found, especially since it showed up in the product all along the line. But if the laboratory was complete, the designing office was so very extensive and so well equipped as to leave nothing to be desired. Then there is the road performance of the cars of this make to be taken into account. As one English visitor put it: "We think our cars are noiseless performers, but as you say in 'Yankeeland' there is one more guess coming." The Packard "18" at the Garden is the "little one" of the family.

If we are again in the Garden, it will be worth while to look into the question of gasoline tanks, just for a moment; they once were troublesome in more ways than one. Some are under the drivers' seat and gravity furnishes the force which impels gasoline to the carbureter. More are at the back of the chassis frame; securely fastened and well up out of the way, when the cars are backed into the curb. Mostly all are of copper. They are sweated and riveted in a manner to assure tightness, and the "filler caps" are quite large. It is also true of a number of them that a reserve supply is at hand, in that all the gasoline will not feed out unless a valve is adjusted to allow the reserve to reach the carbureter. This is a good idea, and it is one to be encouraged by autoists. Then there is the question of lubrication to be taken into serious account. Take the Peerless for instance; examine Model 19. In the crankcase will be found a storage, cast integral, in which a gallon or more of lubricating oil is stored, and by a suitable mechanical means the flow of the oil is regulated in such a way as to assure, (a) profuse lubrication of the bearings, (b) the return of every drop of oil to the place from whence it came, there to be cleaned and re-used up to the limit of its ability. But the oil will not be re-used so many times as to be reduced to inability. Enough is used so that in replacing the same the lubrication value of the whole is kept up to a high state of efficiency. The gear-driven oiler, for the purpose, is on the half-time gear shaft, and it has the facility of not requiring any attention at all. While the Peerless is in sight, have a look at the crankshaft, for it is of special steel, drop-forged, machined to grinding size, and it is then ground to size so close that even a man of good skill cannot find an error, using a micrometer for the purpose. This is not unusual, it might be said; but it is. Only the best cars can claim that the crankshaft is "true," that the journals are not out of round, and that the centers are all to a common axis. Just by way of indicating the close attention to detail which actuates the Peerless designers, have a look at the ignition system, and note the care with which the wires lead to the plugs, and the manner in which the terminals are completed. Autoists will be willing to believe that such matters are a good index of the fair way in which all the work on a car might be done.



The Display of Pierce Arrows Was Effective and in Keeping with that Well-Known Company's Reputation.

The question of noise is also one to concern the autoist, since it is true that the same noise, if it is extinguished, may be at the cost of quite some power of the motor. That this follows as a matter of necessity is not believed. A look at the Pierce Great Arrows will dispel the illusion, if it is true there is one. In this car the motor is noiseless in its performance, and the loss in the process is eliminated. The manifold of the exhaust is so made as to set up vortices, and as a result the exhaust is as a continuous efflux, thus aiding in the scavenging of the motor, even with a saving of the energy available rather than at a loss. The muffler has little work to do, and it manages its part quite effectively. The new Pierce cars as they will be available for 1909 are with an improved gearset, employing four speeds, selective, and materials such as were the dream of autoists but a few short years ago. From the art point of view, a look within one "Great Arrow" will disclose a finish in Louis XVI effect, which for tone is worth going a long way to see.

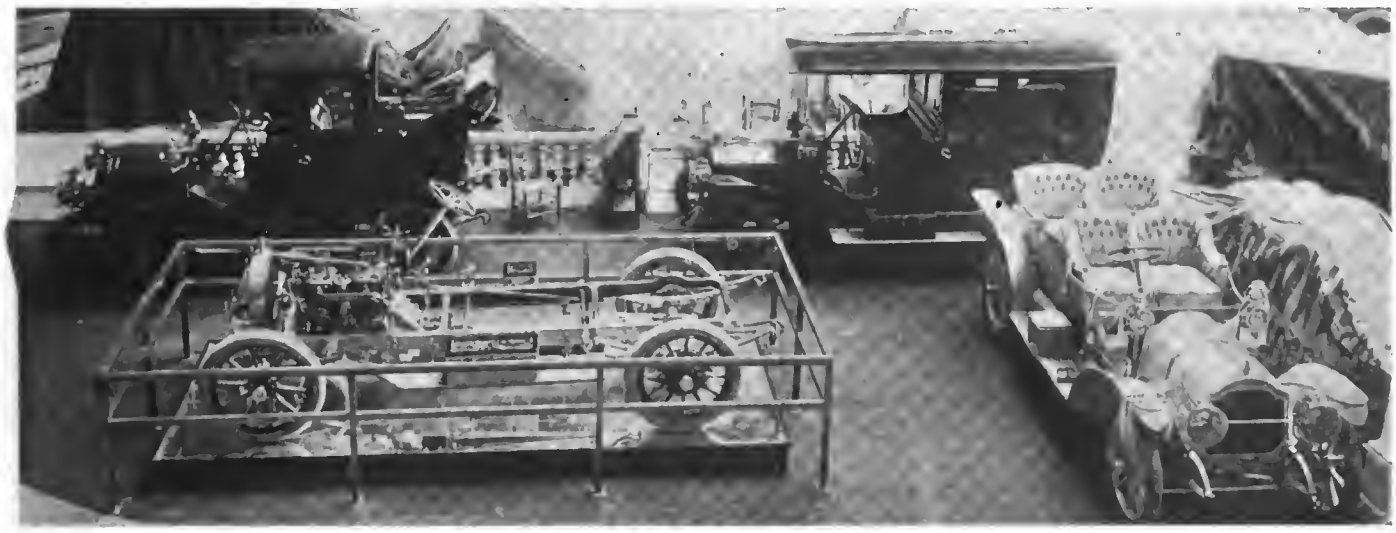
Last year the cars were with brake mechanisms of superior ability, but it is true of them that they had too little surface for arduous service. This year the question is on a better footing, in that the brake surfaces are ample, while at the same time the mechanical motions are quite up to the highest standards. Take

the Pope-Hartford as an illustration; the brakes are of greater diameter, wider face, better linkages, and the result is the cars will respond to the brakes in a way not to be easily explained. To begin with, it is not desired that brakes should skid the wheels; then it is assured that the car will be stopped in the shortest possible distance, if it is true that the brakes will lend all the pressure possible to apply without skidding the road wheels. If the shoes have not the requisite surface they will afford a "fierce" action and the good effect desired is out of the question. In the Pope-Hartford the same reasoning was made to apply to the clutch, with the result that the clutch has a wider face than formerly and the service rendered is quite as perfect as the designers found by experience should be the case. In other ways the Pope-Hartford is modernized; a difficult task to be sure, in view of the degree of perfection which was one of its fair claims. One finds a very nice redesign of the chassis frame, in which a "goose-neck" spring hanger lends charm and strength, while the springs go for easy riding qualities.

While the name is up, it will be a good idea to look at the Pope-Toledo, therein to note the extent to which this well-known product has kept pace with time. The first thing to attract notice is the crankshaft; it is of the ball-bearing type; that it is retained is an assurance of the fact that it works. This company was never of the class to keep a thing a moment after its competence was questioned. This is pleasant to note in view of the fact that some designers say ball bearings do not really have to be used in crankshaft work. They do not go so far as to say that the ball bearings are out of place, nor will they be able to show that they give any trouble which cannot be traced to outside cause. On the other hand, motorists can well afford to encourage two things in automobiles. One of these is good oiling and the other is ball or roller bearings. Anything which will enable a motorist to go about his business on the road without the fear of "frozen" bearings is a good thing to encourage. In the first place, if a bearing is "frozen," it ruins the same; then too, it discommodes the motorist, and besides it ruins the materials of the crankshaft, or whatever it may be. It is in such cars that one will look for the peculiar tint of alloy steel; it is there, in the Pope-Toledo.

Thus far in our journey through the Garden little or no attention was paid to the sizes of motors used. In a way it is true the matter was as a dream, but it is necessary to pay specific attention to a matter of such great importance as the sizes of the cylinders. Under the circumstances, it will be prudent to begin now. In the Royal, the one of the 48-horsepower motor has cylinders with a bore of 5 1-2 inches. It is a four-cylinder motor and according to the A. L. A. M. formula the power would be: $\frac{5.5^2 \times 4}{2.5} = 48$ 2-5 horsepower.

In a word, the cars at the Garden are rated in accord with a prearranged plan, and the result is that they relate to each other in a manner which allows of a comparison, especially when it is desired to note the relation of power of the motors to the weight of the cars, and in this way ascertain if the road performance will accord with the needs in any given case. This is not to say that the gear ratio or the power for weight should be the same for all places. In a matter of this sort it is necessary to take into into account the roads, and the gear ratio should be in accord with the needs. All the cars are so devised as to enable the makers to adjust for road conditions, and there is no argument in saying that a car is a superior hill climber, if the power available is the same as in some other car, unless it is that the gear ratio is adjusted to suit hill work. Before leaving the Royal, let us look at a few of the points of more than the usual note, and by so doing lend to the impression that this company has done its share to maintain the status of the A. L. A. M. In the Model M of this make the transmission is of the four-speed selective type, and the workmanship is up to a standard which lends character to the car. The wheelbase is long, longer than last year, and the general appearance is much enhanced, although the Royal was never of the short wheelbase class. In the matter of brakes, this car is so well equipped as to be noteworthy.



At the Packard Stand an Array of Cars Notable for Constructive Features and Fine Finish Occupied the Floor.

There are three sets of brakes, two of which are on the rear road wheels and the third is on the propeller shaft. The Royal is also provided with a self-starter as an extra in every case in which the autoist thinks he would like to run his own car.

From the relatively high priced car, as above referred to, to the Selden is a big drop in the matter of price, but it is not so sure that the quality of the car can be reduced in anything like the same ratio. In other words, it is but to look at the Selden and to note a full filedged automobile the price of which is $2,000. On the road it is a fact that the Selden is a consistent performer, which is not to mention the fact that it is especially free from noise, under all fair conditions. This is probably due to the skill of the designer, E. T. Birdsall, one of those who succeeded in making machines run at high speeds and not make a noise. This is due to the right distribution of the metal, having in view the fact that noise is not wanted, and that it is worth while to spend a few pounds of metal in the right place to accomplish the result. The end is that the crankcase is not so thin as it could be from the strength point of view, the gear-case is a little more stocky than some cases are, and means are provided to keep a film in all the little bearings in and about the chassis, thereby to prevent rattle, which also assures long life and small loss of power. It may not be generally appreciated that noise is at the expense of power; it is even possible that there are autoists who do not realize that if a spring bends, power of the motor is absorbed in the process. But the de-

signer of the Selden knows about such things, and in the Selden car all these little matters were gone over.

To show the difference in price on a basis in which the difference in quality keeps pace, it is but necessary to examine the Stearns cars, one of which costs $4,600 and is rated at 30-60 horsepower. In the first place the Stearns is intended for the man who cares to pay for the best car that money can buy, in which every detail is on a plane such as would make it utterly impossible for a man of ordinary means to think of paying the bill. In this car it is optional with the purchaser to select either the shaft, or the double side-chain drive, and in a dozen ways the car is one of luxury and refinement. The eye of the skilled engineer quickly locates high priced annular ball bearings all through this car, and the material has the ring of close grain, great toughness, resiliency, and just the characteristics which are present in the product, capable of doing the work for years, with but small chance of even temporary trouble. In the shop where these cars are built it is well worth taking into account the fact that the highest quality—chronometer quality—is what is aimed at, and it is no stretch of the imagination to say bull's-eye accuracy is the result. The extent to which this matter is carried is shown in the simple fact that a "test coupon" is cast on every aluminum casting entering into a Stearns and the company would be able to quickly locate any attempt to "burn" superior proofs on inferior metal. It is no wonder that the car runs into money in comparison with cars which are not so highly powered, and in which the "finish" is not advanced to a "chronometer" basis.

But the subject gets dull, so full of interest is it, which for the sake of contrast will demand a shift to some car of a different school, so to speak. To cast about is to quickly find one at the hands of one of the oldest builders. Take a look at the Stevens-Duryea; it is with a self-contained power plant, in which the flywheel is in front. This is the aluminum motorcase extended back, without change in contour until it makes almost a tube of symmetrical section, the strength of which is assured on a high plane. The flywheel in front gives the maximum clearance, and the leaders in this school of design have good reasons for bolstering up their claims of superiority. The self-contained power plant is with clutch and transmission gearset all in one housing, and the whole mechanism is adequately protected from dirt, and road inequalities cannot upset the alignment of the bearings. Of course, there are various ways to accomplish a thing, and this is one of the ways that time has put the seal of approval upon. In a large measure the success of the car is due to the fine materials used in all the parts, and on the whole it would be pleasant to remain around the stand and admire the details, in view of the nice features of design to be seen.

Magnetos Are the Mainstay for Ignition Service.

For fear it might escape, let us go to the Studebaker exhibition and have a look at the Bosch magnetic spark plugs used instead of the other well known ways. In this scheme it is easy to see that theory has a chance to expand, and the aim is to depart from some of the fallacies which cling like a specter to the methods of the past, as they are used in some cases. In this case the Bosch magneto is used as formerly, but the magnetic spark plugs serve instead of the ordinary kind. The spark plugs so made are self-contained, and a timer of the ordinary description is done away with. The plan has the benefit of a good long try-out and is much liked by the users of the cars. There are a lot of other things to be looked at in the Studebaker which will have to be left for some other time. It will be of interest to go to the Thomas booth and while there look at the six-cylinder cars which made the "Thomas" famous. It will be well to go prepared to take off hats to the "sixes" as they emanate from the Thomas plant. Past performances will influence the situation more than a little; it was a Thomas which won the New York to Paris (won in a walk), and it is also true of the same cars that they have always received favorable competitive mention. Take the "6-40" as an illustration of the latest efforts of the company. The barrel type crankcase is the first thing to greet the eye of the man who knows the scenery. Then, it is to note that the alloy steel crankshaft is centered on annular ball bearings, and the workmanship is a sight well worth going to see. The clutch is of the regular Thomas design in which three (cork insert) discs are used, the same clutch that served in a Thomas in the run around the world. From the clutch to the gearbox the eye quickly takes in a three-speed gearbox of the "selective" type. The gearset is housed in the rear axle, and the axle construction is a modern creation. The springs on which the chassis rides are of the full elliptic (scroll) type, now regarded as a Thomas feature, the value of which cannot be overestimated. In this car the center of gravity is very low indeed, and the road performance is thoroughly good. In a car such as this the question of price is not to be discussed at all. Buyers of Thomas cars are of the class who want the best and they know it is only to be had on a basis to allow the maker to cover the business risk in a manner to leave no chance for an excuse to trim down on the quality.

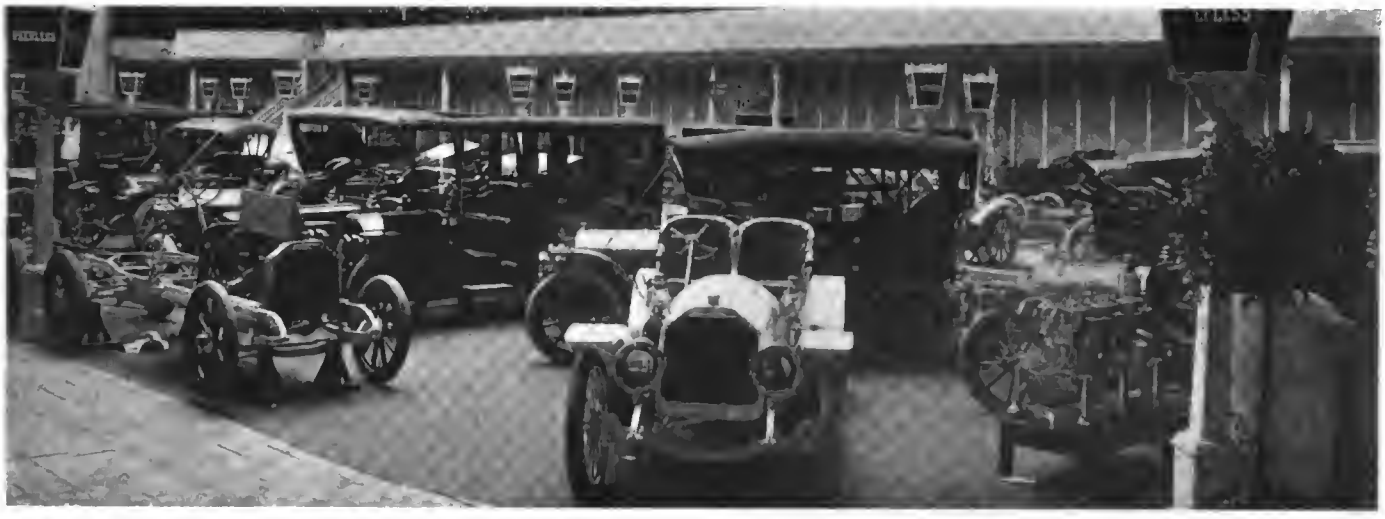
Grand-stand Play of Six-cylinder Cars.

Before closing out what is more or less of a panorama, it will be important to pay a visit to the Winton, noting at the first glance that the cars are all "sixes," and then to observe the "self-starter," which is a distinct advance on trying to "spin" motors of great power. In some cases the same cars are fitted with tire-inflating equipment, and together with all the other advances which go to make Winton fame, renders the Winton exhibition one to linger in, and the cars, of the greatest possible interest. Winton—the name—is historic, and the cars are the logical outcome of a plant which has always been known as "producers," not only of automobiles but of ideas. The new Winton "six" is rated at 48-horsepower and is the same Winton that established the record for low cost of maintenance last year on all the cars produced, which is quite different from noting the performance of a single car under special conditions.

"Steamer," you say; want to look at a steamer. The White Company will be glad to show you. The White booth has two models, both the same in point of the power plant excepting in one particular; the power rating is not the same. On White steamers of the present time it is to note the use of the "joy" valve gear, the value of which is not to be stated in ordinary terms. With this valve gear displacing the "Stephenson," the performance is not only far more flexible, but the economy is much improved as well. Model O is the new (somewhat smaller power plant) car, and it is in every way up to the White standard of excellence.

Body Work Represents Plain Elegance.

Before leaving the show, let us stand at some point of vantage, there to look at it as a whole. What is it that strikes the mind's eye? Is it not the fact that all the cars look different? When we say the cars at the Garden look different, then to explain the manner of the difference is the natural sequence. To render the explanation potent is quite another matter. In the first place it is the bodies that we see, and the difference must reside in the fact that the body work has moved up. It is the difference as between costumes. If they are the product of "Worth," it is one thing; but if they are from some establishment noted for lack of style, it is quite another matter. In a word, something has happened to the 1909 automobiles; they certainly do look different. The best explanation of this lies in the fact that it is not the cars that have changed so much as it is the fact that the designers have moved up. We see the result in the cars, it is true, but it would never be there were it not for the fact that the designers have arrived at a point in their mundane career when to do things on a big scale is the natural bent. This year of 1909 is the year of the "natural bent"; in other words, it is the year in which the ambitions of the men of the high ideals have been cut loose from the environs of the past; the past in which the influences of "horsemen" lent zest to fallacies.



Peerless Exhibit, Showing Chassis, Roadster, and Touring Cars, Backed by a Splendid Limousine.

SIMPLICITY AND STABILITY IS KEYNOTE OF BODY WORK

NOTHING short of good bodies will be found on the chassis at the Garden. Even so, there are differences as compared with the practices of former days. In the first place, it is not now possible to go into the Garden and find a single example of a very inferior chassis hid under a very fine body. But it is possible to go into the same Garden and find a fine chassis sporting a body of no great pretense. In a word, this is the year of standard chassis work and plain body work in the main. Still, this plain body work is with lines; straight lines, they call them.

They are good body propositions, in the main, and free from the strictures that went with the average body not so long ago. The framing of the bodies at the show is the kind of framing that will stand the "gaff." Then there is a decided difference in weight in favor of the 1909 body work. This in itself would be as an incident of no great moment because it is of the greatest importance to distribute the weight in a manner to assure a low center of gravity.

In the work to be seen at the show the center of gravity is held low because the framing is heavy enough to stand and the superstructure is designed for low weight. There is no doubt of the fact that a light framing in the superstructure will last longer than heavy work. It is out of the question to have the superwork heavy and be sure that the body will hold together. The underwork is not so stable as to afford a platform for heavy superwork, and while it took some time to arrive at the facts, the cars at the Garden adequately conform to all the requirements in the light of experience.

Prior to the proper disposal of the details of design along lines taking into account the distribution of the weight it was not uncommon to see body work in which the panels were "checked" rather too soon. Indeed, it was not uncommon to discover this "check" trouble after the very first time the cars had a day under conditions of inclement weather. Part of this trouble was due to other causes, but much of it could be traced to the strains set up in the framing.

Some of the earlier examples of body work included a large use of putty, and it was not uncommon to discover "plaster of Paris" as a lining behind the panels. All such evidences are gone; the work is on a good basis, and it is a pleasure to be able to say that it is now "good form" to use a plain body on a fine chassis just as a silver case ofttimes encloses a fine chronometer. Why not? Is it not the body that goes out of style? If the chassis is of a good design, and if the materials are good as well (and they are in the cars as they can now be had), it will be a very simple matter to change the body at will, if, perchance, the same drops out of step later on with the prevailing styles, which is a likely contingency.

The "straight line" effects as they are to be seen on about all the cars this year certainly do please the eye, for the time being at any rate, and it is the prevailing opinion that these effects will stand better than the "swanlike curves" of the past. Then, it is of the greatest advantage to have wide openings, and it is a fact that the cars of the year are with side entrances wider than they were even last year, which was a year of reform.

In relation to the ventilation of the closed types of body work, it is to note some reforms by way of maintaining a certain purity of the air. There is more evidence of provision by way of preventing the upheaval of dust on the road. These are all questions that are, and should be, discussed in connection with the body work, and it is the bodymaker who looks after them in nearly every case. Even slight differences in the contour will effect this question, and if the bodymaker does not mend the defects it is a moral certainty that the chassis maker will not have time to do anything about it. Even the design of the mudguards is a body question, and it is much to the credit of the bodymakers that the present shapes of mudguards are in vogue. There is probably no one reform that is so pronounced this year as that of the mudguards; as it is, they are all to be desired, and it is assured that the question of any further advances along these lines will be difficult.

As respects types of body work to be seen at the Garden, it is almost enough to say there are none left out. On the other hand, there is no doubt of the fact that there is a decided increase in the number of landaulet types, and they are looked upon as fitting for both town car and taxicab work. In town car service it is not uncommon to see the upholstery in broadcloth, whipcord and, in some cases, goatskin. Some of the examples are works of art, more are on what might be called a standard basis, and in a very few cases it is as "show," with little to back it up. Of course in the latter cases the cost of the body is low, and in full accord with the value.

In taxicabs the interior is on a very substantial basis, using hand-buffed leather for the upholstery, and it is safe to say the work is on a basis to assure long life, at a low cost of upkeep, which is the matter of the greatest importance. Limousine body work is at the Garden in considerable force; this class of work is on a basis that can be set down as stable, and the interior finish is tasty. In limousines it is not uncommon to see the finer grades of broadcloth, a good display of whipcord materials, and goatskin is much in evidence. Colors are in some variety, and there is quite an attempt at ornamentation.

Pierce Limousine Louis XVI Style Embodies Art.

Broadcloth and whipcord fabrics as they are used in the better class of body work will scarcely require discussion, on the ground that cloth finishes come with the high-priced cars in which the body is usually as a "special" and the purchaser is well able to take care of his own interest. If he does not know of his own knowledge he can pay for the services of an expert who may understand the situation. On the other hand, it is in the low-priced cars that the body work must be at a low cost, and the chances of falling heir to upholstery below a fitting standard will have to be taken into account.

The Importance of Substantial Upholstery.

That leather is the most fitting material for the purpose is a well-established fact if the purpose is to use a car in general service and get the most possible out of it. When it comes to leather, there are as many grades as there are cows to skin. There is, however, a general average to be taken into account, and the value of the leather for the purpose depends upon several considerations. In a general way it will be fair to say hides are split in three thicknesses, and it is a natural sequence that the value of the upholstery will depend upon which layer is used. When a hide is skinned it is salted, and if the salting is not well done the hide will deteriorate very rapidly. Then, there is the question of the manner in which the skinning is done; it is ofttimes the case that the hides are damaged in the skinning process. At all events in the tanning process which may be delayed too long, considering a hide is not properly salted, the first thing to do is to remove the epidermis. From this point on it is a tanning process pure and simple. The "corium" or true hide is soaked in water to remove the salt and such other matter as will dissolve in the water. From this process to the "lime" vat is as a step, the idea being to remove hair and such other matter as will be susceptible to the liming. Scraping follows this, and the hides are then "bated" to remove the lime, which is liable to work an injury to the hides. Finally the hides go into the tanning bath and are processed according to the aims of the tanner, depending upon the quality of leather it is desired to produce. At all events, to come to the point, it is true that the hides are put through the "slitting" process, and in the slitting machine they are slit into two or three thicknesses, if the leather is to be used for upholstery work. Now, the separate layers are not all of the same value for the purpose, and it is to the point to know that the leather is of a certain value for the purpose. Then there is the question of the further process after the leather is slit and the tanning work is done. If in the "stuffing" process the leather is stuffed with glycerine, we will say, instead of cod liver oil, which many consider better for the purpose, it will be at a loss to the ultimate buyer, since glycerine is soluble in water, and the leather will not sustain in service as upholstery for automobiles.

Finally there is the finish to be considered. If the leather is of a satisfactory grade, and it is hand-buffed, it will show it, not only in the appearance, but in the pliability. If it looks flaky, and if it is not firm, then it is a sign of leather that is not of a desirable grade, the reason for which may be one of several. The spongy condition is frequently due to the fact that leather is far higher priced than tanning material, and in the "plumbing" process it is the aim to distend the pores of the leather to the greatest possible extent in order that the tannin will "take" to the greatest degree. It will be understood that there is a difference between leather and a hide or a pelt. Leather is a compound of the fiber of the hide with the tannin. If the process is conducted to excess there will be too much tannin, and spongy leather will be the result. Of course, there are dozens of details attached to the process, and it is not the purpose here to discuss them. The point is to show that good leather for upholstery will be from desirable hides, the prime of the slitting process, and the leather should be "stuffed" with cod liver, or other suitable oil.

Finally, it is true that old leather is of small value for the purpose, and yet there is a vast amount of leather that lays in storage for a time too long. If the upholstery is not pliable, of even texture, and if it is not at least of a good machine-buffed surface, it would seem as if it does not belong in a car.

Winton Exhibit Showing Chassis as Foreground for Touring Cars and a Limousine with a Distinctive Body.

Stevens-Duryea Exhibition of Chassis and Body Work by Way of Touring, Roadster, and a Limousine.

Of the work in the stock cars as they were examined it is a pleasure to note that in even some of the quite low-priced cars the leather is of a prime hand-buffed grade from hides that could not have been of a grade below a fitting standard. There may have been cases in which the leather could be questioned, but even they were not so inferior as to demand a strong objection.

No mention has been made of the patent leather finishes. This is a product that will only how to experience. Even the makers refuse to guarantee it, and under such conditions it is not to be expected that writers will reflect its qualities. Even so, it does seem to serve very well, and many autoists take kindly to it on the ground that it does lend enchantment to the body finish. For the man with the pocketbook of sparing purport it might be a good idea to go after tanned leather of the standard finishes on the ground that the risk is well below that of the patent leather expectations, despite its fair utility. In fillings for cushions (stuffing), springs and air cushions are the most durable, but it is now common to use hair. In the "skin" jobs it is the practice to use hair on the top and excelsior for the most part. The latter material is of no value, on the count that it has no life, nor will it stand up for more than a few days.

Some Reflections of the Use of Good Materials.

An examination of the cars at the Garden discloses a diversity in style and of finish, and it is to point out a little diversity. Otherwise it is to note that the materials used are up to a standard which leaves little to be desired, especially in the big cars. In nearly every example of limousine at the Garden the seating capacity is seven; and some ingenuity is in evidence by way of the two extra seats. In the case of the Selden, the shape of the body is novel, in that it narrows toward the front considerably, and it is rather a pleasing effect at that. In the Locomobile the limousine can best be designated as roomy and luxurious. It is a standard product in every way and quite up to the chassis.

Then there is the Simplex with a limousine, also to be classed as luxurious. In body work such as this it is only fitting on the cars of the higher class on account of the cost of the body work. It is not uncommon to have the body foot up to over $2,000, which is overmuch to pay, if the chassis is of a comparatively low cost. But if the cars as noted have body work of a character to be mentioned, it is also worth while to say that nearly every make of car at the Garden is accompanied with an example of limousine, the value of which is not to be overestimated. Then there is the Springfield Metal Body Company, with a fine display of body work in all the types to be seen on the cars, many of which are of the Springfield make.

The White Steamer is there with the usual display in body work along the lines which made the White distinctive for a number of years, but it is a moral certainty that the White "roadster" type of body will be very popular. Then there is a White "close-couple" idea, in which a platform is available at the rear big enough to accommodate baggage, trunks, etc. This idea is one that we have not seen the last of.

On the Stearns cars the body work is on the same high plane as the cars, and this is saying more than a little. In the first place, it will be remembered that the Stearns cars are on a high basis, both in point of materials and in the design. The body work is so in keeping with the cars as to make the whole a picture in harmony. The Stearns limousine should attract more than a little attention among the autoists of good taste, primarily because of the quality of the work in the chassis, and again because of the lines of the body and the degree of finish, as well as the color scheme. Of course, when it comes to color, it is difficult to say what any one will take to. Some like yellow and more like green; all will agree on a high degree of finish, no matter what may be the color.

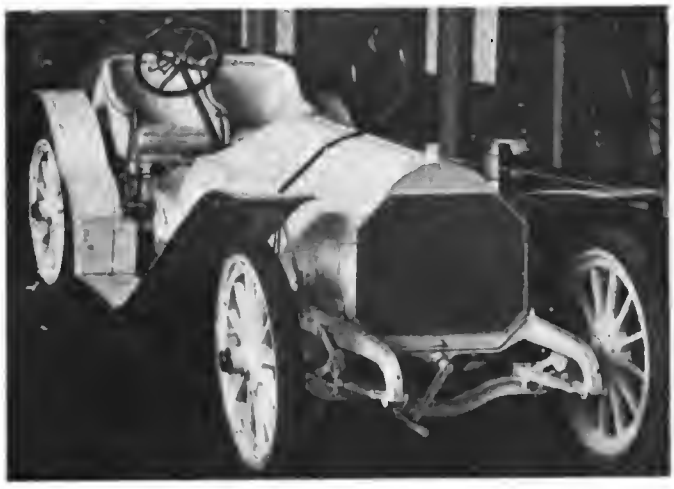
The Craftsman's Skill Displayed in Body Work.

Back of the color is the panel work and the framing upon which the color must rest. If the foundation is not stable, then

Packard Close-Couple, Sensation of the Garden.

it is plain that the color will "rub off." Sheet steel is now much in vogue, and of it there is something to be said beyond the fact that it is strong and of a permanent character. If the panels of sheet steel are properly made, they will add much to the strength of the whole, although it may be true that a sheet of steel, unsupported, has but little stiffness. It is the flanging and the curvature that adds the strength, and it is at almost no cost, nor does the weight increase materially.

The sheet steel can be "black" or it may be coated with aluminum. For that matter it can be galvanized, and even a prime coat of red lead will afford all the protection that necessity demands. Of the sheet steel body work, then, it is plain that it is not high-priced, nor is it likely to deform in service, and, again, it will not check; which is the danger to be encountered when wood is used for the panel work. On the other hand, it is only certain kinds of woodwork which are prone to warp and check. If the wood body work is up to a fitting standard the chances of trouble are slim, although it is true that a good wood body will cost quite as much as one of steel. This would seem to be at variance with the dictates of reason, but it must be remembered that, with steel body work, once the forms are available, it is whipped into shape with a minimum of labor, and in the long run it is the labor item that "canters" into money.



Roebling-Planche, Built by the Walter Company.

Aluminum is used quite as much as usual in the more costly types of body creations and the framing in such body examples is of wood. As a matter of fact, the framing has to be very stout if aluminum is used unless the sheet aluminum is rather thick. Then there is the question of the life of aluminum bodies to take into account. If the aluminum is exposed at any point, or if water seeps through and gets between the aluminum and the wood frame, it is assured that the aluminum will corrode away, and the time taken in the process is too short. On the whole, then, if aluminum is not used in the body work of the lower-priced cars, it is fortunate for the patrons who cannot afford to pay the higher price for the aluminum creations, if there is good chance of their not lasting as long as the steel plate or the wood body.

As to the finish, there is small chance of discussing the questions involved in limited space. With a foundation in which to rest the repeated coats of "finish," there can be as many of them as the autoist has money to pay for. In a general way it will be fair to say 22 coats of finish and varnish (total) will result in a product equal to about anything that man can produce. From the buyer's point of view it may as well be said it is rather a fine body that requires so much work, at a cost that has to be taken into account. The "stock cars" for 1909 will scarcely show evidence of anything like finish at the expense of 22, or even 18 separate finish coats. Indeed, it is a question if the low-priced cars, in which the chassis is on a fairly high plane, will stand the cost of "coach" work in the finishing.

As a matter of fact, it is a question to be seriously considered if "machinery" finish is not more appropriate in cars of this class. Certainly the examples of machinery finish to be seen at the show look quite up to a high standard, and the lasting qualities of the machinery finish should be considered. In machinery finish the base is pure white lead, with a small percentage of zinc. The lead and zinc are ground in oil, and pigment is added to give the color desired. If there is to be a luster, then varnish is added to the materials for the last coat or even two coats. If this paint (which is all it is) is laid on thin, and over a good foundation, it will slick down to a good finish, and five such coats will suffice for any automobile to cost, say, less than $2,000.

Machinery finish is far more durable than "coach" finish, and it can be touched up in due course as the occasion requires. The "coach" finish, on the other hand, will not look first class if it is tinkered with, and it is claimed that to refinish it is necessary to burn off the old coat before applying the new. On the whole, it is well to be satisfied with a little less finish on the body work of the cheaper cars, especially if more automobile is given instead. Indeed, it seems to be the case this year that the finish is less striking and the machinery is conspicuously good.

Some of the Notable Bodies.

In conclusion, it will be the idea to mention several of the highest-priced bodies in the show, especially as they are something by way of an art proposition that is of considerable interest. This is particularly true of the Pierce Arrow, Louis XVI creation, as talked about in THE AUTOMOBILE last week. In view of the description as given last week, and the illustrations afforded, it will not be necessary to go into the matter at further length at this time.

In some of the exhibits the cars are provided with bodies on a plane indicating that it is the aim to deal with the over fastidious to their hearts' content. The distinction to be made is this: As a rule, the stock cars in the Garden are fitted with bodies up to a certain standard of excellence, with the understanding that "creations" can be had as specials. In some of the cases, however, the body work is of such a fine character that it must be confessed that there are no "creations" that would make a better showing. Take, for illustration, the Packard "close-couple"; it is one of the types of body to which the patrons of the industry have taken a strong fancy, and the particular example is up to such a high standard that it is bound to have a lasting effect on the future of automobile body work.

The Thomas "4-60" with a limousine is one of the cars of the show to which the pilgrims with money to spend are invariably tracked, and it is assured that this car, with the luxurious body it supports, is in keeping with Thomas aspirations in all respects. In a certain sense this body work differs from many of its neighbors in that it is not in any sense loud; to fully appreciate its excellent qualities it is necessary to go into the limousine and stay there long enough to get used to quiet luxury. The "6-40" Thomas is also there to be examined, and it is worth a trip to the Garden for that purpose alone.

THE NEW ROEBLING-PLANCHE CARS.

The Roebling-Planche, of the Walter Automobile Company, Trenton, N. J., though a newcomer, embodies standard methods long and favorably known for true worth. The cars are of the tried-out, modern methods, using most approved materials and designs that stand road work, as would have to be the case considering the motors of great power used in the Roebling-Planche cars. The motor work belongs to the class with "T" cylinders, and the castings are positively superior. The chassis frame is of splendid strength all along the line. The ambition comprises three cars, one of which is the big racer, rated at 120 horsepower; the second is a medium-powered car to go about a mile a minute or a little better, and the third is a comfortable, little power plant proposition in which speed is secondary, but in which it will be found adequate for all reasonable needs in town cars, taxicabs and for many purposes.

Thomas Taxicabs Naturally Attract Much Attention.

Studebaker Electric Trucks Have Substantial Look.

DETAILED PROGRESS AS TOLD IN COMMERCIAL CARS

THE commercial section shows many peculiarities, among which the most noticeable is the matter of load capacities. It was formerly thought that the truck reached its maximum capacity at or about five tons. The development of the past year or two decided in the minds of many manufacturers the fact that this limit had been placed too high and in the light of their experience should be reduced to three tons. That this opinion was not universal was shown at the other show, where one prominent commercial manufacturer showed a new five-ton truck, which had, moreover, a 50 per cent. overload capacity, thus bringing the nominal five-ton rating up to 7 1-2 tons.

Many Big Trucks Shown for First Time.

On top of this the present show chronicles the first public appearance of a new four-ton and a new five-ton, as well as the showing of another five-ton, and the cataloguing by the latter maker of a ten-ton machine. This latter is now the largest-capacity single vehicle in the world. In the light of these facts, it would appear as if the load limit not only had not been reached at five, but probably should be no less than ten tons. So the peculiar situation obtains, either the limit is three tons or the limit is ten tons; pay your money and take your choice.

Going into the details shows that the progress in load-capacity, if it can be called that, has been in the past largely a matter of the ability of rubber tires to stand up under the hard work. In fact, it may be pertinent to the subject under discussion, to repeat the statement of the maker of five and ten-ton machines previously spoken of. He says in part: "We could not build a successful ten-ton truck until the block tires were tested out and found satisfactory for heavy loads," and, again, "the wheels have been calculated so that the pressure on the ground does not exceed 700 pounds per inch of tire width, while the loads on horse-drawn vehicles commonly exceed a ton per inch of width." The latter are, of course, of steel, so that an analysis of this subject, and, particularly of the above statement, shows that the load progressed only with the progress in tires. In this connection, dual tires are on all of the heavy vehicles, and the block tires with individually replaceable blocks have made substantial and lasting progress. But the end of the tire question is not reached by any means.

New Spring Device on Newcomer.

It has been aided perhaps by suitable springing, Alden Sampson, for instance, fitting a spiral spring arrangement on the rear end of the very flat and very stiff rear springs. This carries the body empty and with very light loads absorbing all of the little shocks and jolts, while for heavier loads, close to the capacity of the vehicle, these are down tight together and consequently out of action, the stiff rear springs doing all of the work.

A side issue bearing indirectly upon this is the matter of carrying the radiator upon springs. This very delicate part, always susceptible to the smallest shock, it thus adequately protected and one source of trouble and expense removed. The writer knows of a maker who tried to support the radiator on soft pine blocks; result, more broken radiators. Then very thick soft leather was used in combination with the wooden blocks; result, not as many broken, but a constant source of trouble. Thus it is seen that this is a big step in advance. If the fact that an ordinary heavy truck radiator in place represents no less than $100 to $124 (and repairs cost proportionately), is mentioned, the advantages of properly protecting this part are stated in a few words.

To note all of the springs is to see the use of wider steel, a lesser number of plates and a flatter shape. The springs are of a superior material, in some cases of an alloy steel. The flatter shape necessitates greater stiffness for the same length, which is secured without overdoing the matter by the use of greater widths. Some consideration is being given to the matter of spring suspension for the motor and transmission, although none is shown.

How Knox Has Solved Proper Unit Suspension.

This item of proper unit suspension is, however, solved in several ways, all of which bear the earmarks of careful design. The Knox truck has adopted the three-point suspension with the engine and transmission as one unit; the Autocar people have the three-point, it is true, but there are two units, the engine and transmission mounted upon a sub-frame attached to the main frame at one central point in the rear and two in front. Alden Sampson, on the other hand, has hung the engine on a sub-frame, which in turn is flexibly spring suspended from the main frame. On this car, too, the transmission and differential units are each on spherically seated three-point suspensions. Each one of these methods has its own individual advantages, while the general idea of all three is to relieve these important parts of vibration and the strains due to the distortion of the main frame, this latter being necessary.

Very Few Shaft Drives Shown.

But three advocates of the shaft drive are to be noticed, each one of these being an outgrowth of the same manufacturer's pleasure car business. Two of these, the Thomas town car and the Autocar delivery wagon, deserve no special mention, but on the third, the Franklin, is noted the use of a worm drive. This has perhaps an advantage for light work that cannot be overestimated, combining as it does with efficiency and other features, the more important one of noiselessness.

Some other outcroppings of this reduction in the noise idea, so noticeable in the pleasure car section, are to be seen. Thus Sampson has used a silent chain for the final drive, which has

In the Basement the Commercial Vehicles Hold Forth.

been further augmented by the fitting of a chain case. The latter reduces the wear of the former, by providing proper lubrication and secure protection from dirt, stones, etc. Other makers have arrived at this point, where they admit the necessity of this and will furnish it upon demand. These latter have gone to larger stronger chains as a safeguard against future trouble.

As noticed at the other show, the unreliable differential is losing ground, in one case in favor of a positive acting differential of an entirely different type. An idea shown in working form for the first time at the Garden show is a differential lock. This is hand applied, the idea being that when one wheel drops into a rut or slippery place the driver can, by throwing in this lock, pull out unaided. Then, too, this had a positive advantage in the unusual case of a chain breaking. Then by throwing in this lock the car can limp home using one chain.

Small Cars Lead in Progress, Though Small in Numbers.

In the small cars the progress is perhaps more noticeable than among the larger ones. In numbers they are about equally divided, but the latter are nearly all newcomers, so that as showing the modern tendencies it would appear as if the smaller car was gaining ground faster than the large one. The Autocar Company show its light delivery wagon for the first time, a chassis, and one of the Atlantic & Pacific Tea Company's wagons being exhibited. An engine and transmission in a dummy frame illustrate the quick removable sub-frame, this firm being the only advocate of that form of construction.

Franklin shows a full line of air-cooled commercial cars. These include a taxicab, a 1,000-pound express wagon with covered sides, and a two-ton truck with open stake platform. In all of these the same motor is used, this being 3 3-8 by 4, four-cylinder of the regular Franklin construction. The usual features, full elliptic springs, wood frame, tubular axles, etc., are retained.

Electric Driven Ambulance Built by Studebaker.

Hewitt exhibits for the first time the chassis of a new two-ton truck. The phrase, "Pedals to push—that's all," indicates clearly the construction. The keynote of simplicity carries all the way through, thermo-syphon cooling, double opposed motor, planetary transmission and other features being present. This same maker also builds, but did not show, a three-ton truck on these lines.

Mention of the Electrics.

No discussion or mention of the power wagons would be complete without mentioning the electrics. These are out in force, and vary in numbers from a single machine by the Champion Wagon Company up to five by the General Vehicle Company, and six by Studebaker. The Champion exhibit is a 1,000-pound wagon for the United States Express Company. This has single motor equipment driving a countershaft by Morse silent chain, and from there double roller chains to the rear wheels. The motor is of the G-E 10-20 type. Wheels are 36 inches in diameter with 3-inch tires all around.

General Vehicle Company Has a Full Line.

The General Vehicle Company show an unusually full line, ranging from a 350-pound light delivery with single motor, left hand control, tiller steer and other delivery wagon characteristics, up to a 3 1-2-ton truck with double motor equipment, open stake body, wheel steer and heavy, substantial construction throughout.

The basement showing of the Studebaker company includes an 850-pound delivery, a 1,500-pound delivery, 2,500-pound express truck without a top and a five-ton open platform truck. The delivery wagons are both fitted with lever steer, while on the trucks wheels are used. The big truck shows good attention to details, the axles, springs and wheels being well proportioned to the load. Upstairs the rest of the Studebaker exhibit consists of a twelve-passenger brake and an ambulance.

Fire Apparatus Attracts Much Attention.

The marked attention being given of late to the vehicles for hospitals, and more particularly for fire service, is to be noted in a pair of fire wagons exhibited by the Knox company. One of these is a high-pressure hose wagon for the city of New York. This is on a five-ton chassis equipped with 60-horsepower motor. There are two plugs on each side of the wagon, four in all, allowing four high-pressure lines to be coupled on. These lead to a large, high, pivoted nozzle in the center of the car, which, except for height, answers all of the purposes of a fire tower. The body of the wagon is arranged in the form of bins, three being provided, to hold a total of 21 lengths of 50 feet each of 3-inch high-pressure hose. Additional space and running boards provide for the carrying of a large number of men. Another fire department first aid wagon is also exhibited.

The commercial cars as a whole, gasoline and electric, while few in numbers, make apparent big advances in almost every department. The progress in this line may be slow, but it at least has to offset that, the merit of being sure. It is to be regretted that the well-known pleasure car manufacturers now building trucks or some other form of commercial cars do not exhibit alongside of the strictly commercial firms, as the comparison would be invaluable for all concerned. Thus the Packard, Pierce, Peerless and Locomobile trucks added to those on view would have made an exhibition worth going miles to see.

CLEVELAND IS USING THE "TAXI."

CLEVELAND, Jan. 19.—A month ago taxicabs were regarded with grave doubt in this city. Now three concerns are operating them, with rush orders in for thirty-five additional cars. The Charles B. Shanks Company, using Chalmers-Detroit cars, and the Studebaker Automobile Company led off, followed by the organization of the Citizens' Taxicab Company. The latter company is using Elmore and Cleveland autocab machines, the latter being designed by Louis P. Mooers.

The Citizens' Company is headed by a former New Yorker, Francis J. Wallace, and is devoted solely to running taxies. The cabs ordered by them are now arriving in this city.

A View of the Artistic Waverley Exhibit.

Babcock's Natty Runabout and Bridal Car.

ELECTRICS, VASTLY IMPROVED, ARE VERY POPULAR

THE electrics, segregated as they are in a neat little entrance hall, beautifully finished off, have some advantages in location alone, in that they will not be bothered by the vast crowd of the curious, only those vitally interested being at the pains to hunt them up. That this is fact rather than theory is shown in the number of people present there at any one time as compared with the main hall or balconies. With this geographical advantage of location we find the additional advantage of harmony, in that the exhibits all harmonize. Nearly every maker shows a closed body in black finish, usually a brougham; every one except the E. V. Company show in addition a victoria phaeton; in addition all have an exhibit of batteries, motor, or final drive, something to compare with the finely finished chassis of the gasoline cars, and perhaps the most noticeable feature of all is the runabout. In the attention given to this and the prominence accorded it in the exhibits, together with the bare idea of such a design, we find the first indication of the gasoline car practice. This is evident not alone in the body, but also in the phoney hood, the wheel steer, arrangement of the control with long vertical side levers, the use of some form of dashboard, the swing and style of the fenders, straight lines of the body, style and appearance of the top as well as many small mechanical details.

All these bespeak the success of the gasoline car and the desire of the electric makers to get in on it. This is very praiseworthy, but as much cannot be said of the working out of the idea, for that has seen the first evidences of a loss of identity, the electric by a process of future development along this same line, finally degenerating into a virtual copy of the gasoline car with only the substitution of electric power.

Bailey shows a very attractive victoria phaeton with beautiful body line. This had a most unusual steering wheel, the peculiarity being in the shape, circular for about two-thirds of the circumference, the rest of the wheel consisting of two straight sides. A runabout of strictly gasoline lines made a very attractive appearance.

Baker was one of the premier advocates of few batteries, thus securing light weight, and this company has about the smartest raciest looking runabout seen yet. This has a high-speed capacity when required with all of the usual normal speeds for ordinary work. A long wheelbase, rakish tilt to the left-handed steering post, and long sweeping fenders give a low long appearance which indicates speed. A liberal use of annular ball bearings makes for easier running and higher speed.

The only vehicle shown by the Electric Vehicle Company is an inside operated brougham, known as Mark LXVIII. This is a very luxuriously finished car, the upholstering and trimming being worthy of particular mention.

Considering the geographical location of the Anderson factory at Detroit, close to the always successful Packard, it is not surprising that this firm's runabout closely resembles in appearance that well known car. The straight line body, the wheel and hub caps, springs and spring hanging, all show traces of the original from which the copy was made. The copy possesses in its own field, too, equally as much merit as the original.

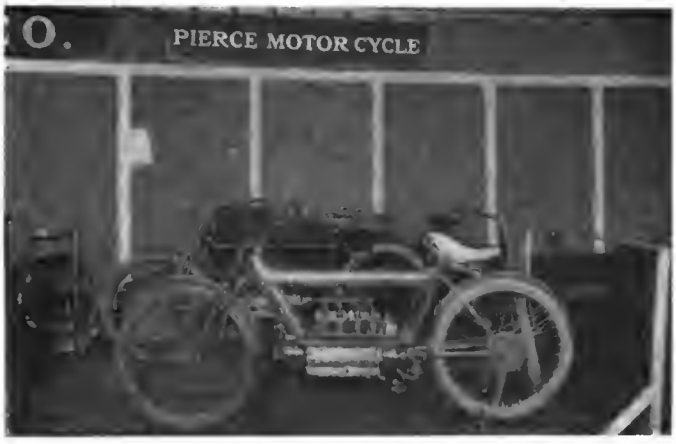
While Rauch & Lang manufacture twelve different cars in six styles, but two are shown, a coupé and a phaeton. In addition to the former, a very popular Winter car, and the latter, a more pleasing type for warm weather use, a set of batteries wired up to a motor, as well as the controller, were shown on a dummy sub-frame.

As this was the first portion of the automobile field exploited by Studebaker, this large concern, it is but natural that a very strong exhibit would be made in this division. The runabout, phaeton and coupé are all shown, in addition to which there is shown a four-seated brake and an ambulance. The latter is a great source of interest and evidences great attention to details of construction on the part of the factory. Thus the rear end of the body has two separate and distinct spring suspensions. The chassis is on a pair of semi-elliptic springs, while the body is hung upon a distinct set of springs of the full platform type.

The Waverley Company exhibit upon entering the hall is the first sight to greet the eye. These are the two new types with the even newer features. But best of all is an electric exhibit of the motor and rear axle construction, showing the enclosed double gear reduction, the floating rear axle, etc.

The Woods Motor Vehicle Company has wandered away from the crowd in location at the show, being on the elevated platform, commanding a fine view of the main hall. This commanding view and isolated position are perhaps typical of the maker's standing in the industry. The use of annular ball bearings throughout the car, no less than sixteen being used of the highest grade, makes a fine showing for the prospective purchaser. The idea is that the ball bearings alone do represent much, but taken with the fine workmanship necessary in conjunction with the proper use of these imported bearings, means much more. A complete assembly frame is shown, this including motor, reduction gears, differential and countershaft. A noticeable feature is the use of herringbone reduction gears. These are very expensive to manufacture and assemble in comparison with spur gears, but otherwise all of the advantages are with the herringbone. The sprockets, too, show careful workmanship, being cut from dropped forged blanks and carefully hardened.

Taken as a whole, the electrics seem to have gained in popularity, coincident with improvement in electrical and mechanical details, superior materials, improved workmanship and up-to-date design. It is not strange in the light of these detailed improvements that the 100-mile car is in evidence.



Pierce Company Displays an Attractive Four-Cylinder.

Reading Standard, One of the Motorcycle Pioneers.

MOTORCYCLES FOLLOW AUTOS—SHOW BIG IMPROVEMENTS

THE tendencies among the motorcycles seem to be those that bring this vehicle closer and closer to the automobile. This industry, if it may be properly classified as a separate industry, seems to be going through the period of change preceding a period of standardization, which was peculiar to the automobile industry a year or a year and a half ago. The question of ignition, relative to single or double, magneto, timer or both, which finally resulted in the nearly universal adoption of single ignition with a magneto as a source of current, is now being fought out once more in the motorcycle division with the added zest lent by the fact that the make-and-break system has a proportionately larger and more influential following. The handwriting on the wall is seen in the adoption of the Bosch magneto as a single source of current on such leaders as Pierce, F. N., M. & M., Peugeot, Royal and N.S.U., also fitted as an extra on Excelsior, R-S and Thor.

Another feature in which automobile influence is shown very markedly is in the number of cylinders. The two-cylinder finds many more adherents than does the single; in fact, this tendency is so marked that hardly a manufacturer present has had the temerity to stake his reputation on single cylinders only, all showing both single and double cylinder models. In this case, too, the multiple cylinder machine is given the preference over the one-lunger. This tendency is being carried forward to the four-cylinder, as it was a year ago in the automobile field, being plainly shown in two four-cylinder models exhibited, both being comparatively recent arrivals, but in each case from an old-established house. Rumors of several more four-cylinders the coming season are heard.

In this connection the matter of valve operation similar to the four-wheeled machine motor is gradually receding from suction inlet valves towards mechanically operated and interchangeable valves. In this class, which is constantly growing, we find to-day N.S.U., Royal, R-S and others.

The final drive, too, shows a decided leading towards the practice of the past on the four-wheeler; that is, in the increase in favor of the positive drive over the friction or belt drive, and in the former class the gain made by the shaft. One year ago to-day there were no shaft drives; to-day, two of the latest models show them, these two incidentally being the two four-cylinder machines. The chain continues to gain over the belt, and in turn has lost some adherents to the shaft class. Six chain drives were observed and seven belts, but of the latter the V or trapezoidal belt had four adherents. As the latter is very close to chain construction with its wedging non-slipping action, these might without serious error be classed with the chains.

Not the end of this list of comparisons, by any means, is the matter of transmissions and clutches. Where one year ago these were unknown in the two-wheeled vehicles, the present show reveals one or two of the latter and still more of the former, the stock argument being usefulness of low speed for

In materials, too, the hue and cry raised a year ago in the motor world has awakened the motorcycle man to the great advantages of superior materials. So we find a liberal use of nickel and other alloy steel for crankshafts, wrist pins, valves and other parts, as well as a lot of special steel for springs, front forks, etc.

Longer wheelbase, larger tires, better and more comfortable seats, more cars fitted with foot rests to allow a change of position, longer and more comfortable riding handle bars, a lower center of gravity, better mudguards, a more efficient exhaust system, and stronger frames, are the more noticeable changes.

A Very Complete Line Is Exhibited of N. S. U. Cycles.

New Era Auto-Cycle Has Attractive Appearance.

Concert Hall Is Most Artistically Arranged and the Accessory Makers Housed Therein Are Happily Comfortable.

ACCESSORIES WITH FIRST 1909 SHOWING IN THE GARDEN

AFTER the cars have been examined—and often before—the innumerable accessories command the most careful interest and examination. The proof of this is easily demonstrated by the coteries assembled at the various spaces where something is added making for the more complete and greater enjoyment of automobiling.

At the Garden few of the accessory exhibits seen at the Grand Central Palace are missing, but as many are added as subtracted from the grand total.

In a general way, it may not be out of place to mention one or two tendencies. For illustration, it is quite plain that "non-skids" have the center of the stage in one zone of activity; then there is a fine display of "demountable" rims, and "detachable" ideas are there in plenty. In a word, the "footwear" of the auto is receiving much attention.

It is also a fact that the question of lubrication is so thoroughly in hand as to render it a conspicuous feature of the accessory exhibition at the Garden. Autoists now appreciate the fact that the absence of an oil bill is a sure sign of a repair bill, and they also know that the oil bill is the least of the evils.

Of jacks and such devices there is also a good showing; but it is the ignition situation that is the most on the surface, if indications count for anything. All through the booths, and down in the cars, everywhere, the ignition question is uppermost. There are points in relation to this phase of the automobile which would stand much discussion were the time and the space available. In the first place, if the earlier schemes of igniting had faults, the same faults are now conspicuous for their absence. The reasoning of last year is defective this year, and it is more of a problem than ever to be able to decide in an unbiased manner the means for the end.

Magnetos are quite as conspicuous as before; they are in superior form, just as one would reason; but it is not any more plain that they should be applied in one way or the other than it was some time ago. The other side of the question is as full of meat as a cocoanut, and the "magnetic spark plug" is having a large say. Then, there is the unit coil, the Atwater-Kent system, the master vibrator and numerous other details, all so carefully worked out that it is a great game to look them up and discuss their relative advantages, only to conclude that it is simply a matter of appropriate selection in the long run.

So on, all through the show, devices of merit, each in its place, all displayed to the greatest advantage, and interested spectators everywhere. It is a source of regret not to be able to render again a full description of all the accessories at the Garden, but the information will be found in THE AUTOMOBILE of last week, or the week before, or the week before that; in the meantime it will be the aim to discuss such new matters as the search is sure to unearth.

TIRES AND ACCESSORIES.

Atlas Rubber Co., Buffalo, N. Y.—The exhibit of this company consists of a non-puncture inner case. This is a device looking not unlike a very light cloth-covered outer shoe, which is placed between the shoe and the tube. When this is done punctures are absolutely impossible. This feature is secured by inserting, in what might be called the tread of this inner case, a series of flat discs of steel. These overlap one another and enough are used to protect completely the inner tube. These strips are very thin and not very wide, being about 1-32 by 3-8-inch in cross section, but the size is kept down purposely so as not to increase seriously the weight of the tire nor impair the resiliency.

Dow Demountable Rim, New York City.—The very general interest of the past year in methods of quickly removing a punctured tire and replacing it with another good tire has culminated in a lot of demountable rims, tires and wheels. One of the best of these is the Dow rim shown in the basement of the Garden. This consists of a series of five converse wedges on the felloe which co-operate with an equal number similarly placed on the rim. These not only taper in a circumferential direction but sideways as well, so that when once turned on the rim simply cannot come off; when turned so as to come off the two tapers aid in removing it quickly. This turning is easily accomplished by means of a rack fastened to the rim, the turning of it being done by a key with teeth on it, which teeth engage with the rack. A locking device or plate is simply to prevent change of relative position, and while it takes the driving strain, the size is such as to preclude any possibility of failure. The change with this rim may be made by a novice in a few seconds, the reverse process of putting it on being made with equal facility and speed.

Hopewell Bros., Cambridge, Mass.—Not the least of the exhibitors is the showing of the garment makers. This firm shows fabrics, robes, vests, etc., as well as the Hopewell tire case. Now that a great deal of interest in the subject of tires has been aroused, many autoists who did not do so formerly are now carrying extra or spare tires. To do this properly requires a tire case. The tire cases made by this firm have many points of superiority and many special features, all of which go to make a trip to its booth in the gallery well worth while. They have no buttons, no laces, are perfect fitting, and absolutely waterproof. If that doesn't suffice to arouse curiosity enough to visit the exhibit, then the case is hopeless.

Trenton Rubber Mfg. Co., Trenton, N. J.—Prominent in the balcony is this firm, manufacturers of wrapped tread tire casings, other rubber specialties, and "Thermoid" brake lining. The latter has attracted a whole lot of attention during the past year from the fact that it will not burn out, lasts indefinitely, and grips instantly. With these sterling qualities it could not help but be a successful lining for brakes. It is made in all standard widths from 1 by 1-8 inch up to 4 by 1-2 inch, but may be had in any length, width and thickness. Aside from rubber tubing and other minor rubber specialties, the wrapped tread casings attract the most attention. These are very well and carefully manufactured, the tire is perfectly and uniformly cured, at the same time guarding against buckles and blisters. The price of these is low, giving the buyer either the same tire for less money or more value in the tire at the same price, so that the buyer wins out either way.

Nadall Mfg. Co., Chicago.—One of the best of the demountable rim devices is shown at this stand, this, by the way, being a newcomer. The rim has a series of three arc-shaped shoes which hold the clincher rim to the felloe as they are forced radially outwards. This forcing is done by means of a special wrench which fits a nut on the inner projecting ends of the shoes. When rotated one way this pushes the shoes outwards, locking the rim in place, while rotation in the opposite direction serves to loosen it. A locking device at the end is covered by means of a light brass threaded ferrule which also contains a lubricant, thus keeping the whole device in an operable condition at all times. The shoes, which are the important part, are of cold rolled steel, 3 inches long, 1 inch wide, and 1-2 inch deep at the thickest part. The outer surface of these is curved, this curvature being the same as that of the slot in the clincher rim which receives it, both radii being different from the radius of the inside of the rim. Beveled edges allow pressure upwards and to the side, as well as an easy entrance of the shoes into the slots.

U. S. Spare Wheel Co., Detroit.—This is a new spare wheel with a quick attaching device. The wheels are light, yet very strong, without felloes, spokes or hubs. The ingenious mechanical fastener consists of four parts, two stationary and two locking clamps. The two latter operate by the simple pulling up of a ratchet lever, which may be done as quickly as it is told. To release, a catch is held up by the thumb and the lever pushed in the opposite direction. All arguments applied to spare and demountable wheels and rims

apply with equal force to this one, the quick-locking device being an additional good point.

TANKS, RADIATORS, ETC.

Avery Portable Lighting Co., Milwaukee.—These pioneer makers of gas tanks under the trade name of "Autogas" show the three automobile sizes and the very newest motorcycle size. The latter is a small one, being but 2 inches in diameter by 15 inches long. At that it will supply a one-quarter foot burner for 28 hours. The cylinders used for all of these are of cold drawn seamless steel of a heavy gauge, the bottoms being double and brazed to resist greater pressure than the sides. After plating they are tested to 800 pounds, so that with the filling restricted to 225 pounds pressure a factor of safety of over 3 1-2 is secured. To insure additional safety, a plug is fitted in the bottom of each tank, which will rupture at 500 pounds and permit the gas to escape. The idea of this is to preserve the tanks, which in comparison with their contents are very expensive. The tanks are fitted with purified and dried acetylene gas generated at the factory in special large gencrators. The pressed steel boxes for carrying an extra tank on the running board were also shown, these being of simple yet pleasing design and extremely neat in both internal and external appearanee.

Auto Pump Co., Springville, N. Y.—This is one of the simplest and plainest yet most useful exhibits of the show, being but an exposition of the Spencer power air pump. It is a one-cylinder pump for tires and has two pistons, so that the single cylinder is as effective as two. The shape is such as to allow holding in the two hands while connection is inserted and held in the end of the starting crank. To allow this a special starting crank with a ratchet is furnished by the company, the ratchet allowing the crank to remain stationary while the pump is in use. Although small and inexpensive, this is very carefully made and every one is tested to 120 pounds pressure.

A-Z Co., New York City.—Surrounded by a bulwark of square tube radiators, as made for Lozier, Stevens-Duryea and many others, the real exhibit of the details of this company's construction are effectually hidden. Behind the bulwark, however, one finds an exposition of a new departure in radiator construction. This is of the bulge square seamless tube type supported on ball trunnions on either side, the latter following out the more modern tendency to do away with a solid fastening for delicate radiators. Various sheet metal accessories and novelties are shown, including hoods, fenders, trunks, mufflers, etc.

Livingston Radiator Co., New York City.—The excellent showing of square tube effect radiators as made for such discriminating buyers as Simplex and others, attracts much attention. The good features of this square tube, aside from the improved appearance, are more efficient cooling, due to larger air surface per square foot of frontal area, increased flow of water due to larger water spaces, lighter weight per surface unit, strong non-leaking joints, and other minor points. All these are brought out at the exhibit space by the use of sections completed and partly completed, showing the various processes of soldering the edges of the sheets, etc. The radiators may be had with a seamless case or with double seamed and securely soldered joints. To insure against leakage from any cause whatever, all radiators are tested at the factory to 20 pounds pressure with both hot and cold water, while frequent tests using 40 pounds have had no serious results nor any breaks.

Lunkenheimer Co., Cincinnati.—The product of this concern is almost too well known to require any mention, including as it does all kinds of brass goods, gasoline strainers, priming, oil and grease cups, generator valves, etc. Recently, however, several exclusive automobile specialties have been developed. Chief among these are the multiple-feed mechanical oilers. These are made to suit individual requirements and may be had with or without an independent manifold or sight feed. These are worm driven from the belt shaft and may be had in any number of feeds from four on up. The pump portion of this is very simple, in marked contrast to the usual complicated pump. Another new specialty recently brought out is an exhaust pressure regulator which may be used anywhere that pressure is desirable,

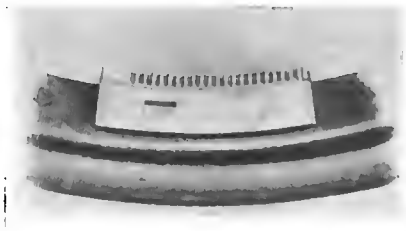
Fisk Exhibit Had a Picturesque Look and Outlook.

The Firestone Solid and Pneumatic Were Both Here.

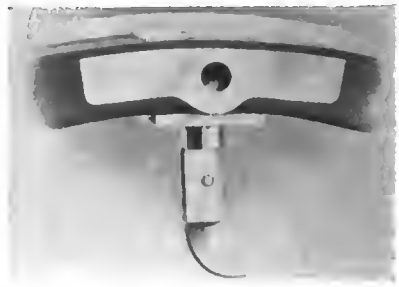
as in connection with oil or gasoline tanks located at the rear of the chassis, for operating an exhaust pressure lubricator, or any similar use. This is a very simple positive device of small size, which in use has been uniformly successful. It has found favor among the autoists of discrimination and it is well worth looking into.

gasoline is rendered available at will, in just the right measure. In some cases the pump is located inside of the garage, and, again, for the greatest possible safety, the pump is located out of doors. In all such cases a suitable cabinet is to be had from the Bowser company, and, with the gasoline protected from evaporation, water excluded and the whole under lock and key,

Dow Rim Showing Key in Position for Use.



Dow Rim Showing Clamp Fixed to Felloe.



Dow Rim Showing Key Inserted to Make Ready.

S. F. Bowser & Co., Ft. Wayne, Ind.—This is the company whose equipment covers the field of gasoline storage on a basis of economy and safety. The exhibition at the Garden is of the greatest interest and includes a line of storage tanks, as well as pumps, of the class that will not only handle gasoline, but measure the same as well. It will be remembered that with the Bowser system the tank for the gasoline is underground, and by means of suitable piping to a pump conveniently located the

the system is one of the best investments for the autoist of business acumen. Then, there is the insurance question to be taken into account, and it is one of the advantages of the Bowser system that it is so good as to meet with the entire approval of the Association of Fire Underwriters. Thus, the installation must be made according to "code," but it is the practice of the Bowser company to furnish all the information required for the purpose so as to make it simple for the purchaser.

GOOD LUBRICATION AN AUTOMOBILE'S NECESSITY

Adam Cook's Sons, New York City.—This old and well-known firm showed the equally well-known Albany grease in four grades. The product is, however, made in seven regular numbers. Of those shown Nos. 0, 1, 2, and 3, the first two are for transmission, equalizing or other gears, the former in Winter and the latter in Summer. For other automobile uses No. 3 is recommended for Summer and the lighter, No. 2, for Winter use. This is a pure lubricant, which, its makers state, does not drip, splash, or waste away, is self-acting, and runs only when the parts are in motion. The quality of all of the seven numbers is the same, the only difference being in the consistency, this being done to suit the use for which it is intended. The exhibit was a simple exposition of the product on its merits, no attempt being made at original and startling effects.

Columbia Lubricants Co., New York City.—Prominent at this stand were two large glass cases, the one having a full line of this firm's familiar Monogram oils in the various grades.

Monogram Oils Made an Effective Showing Here.

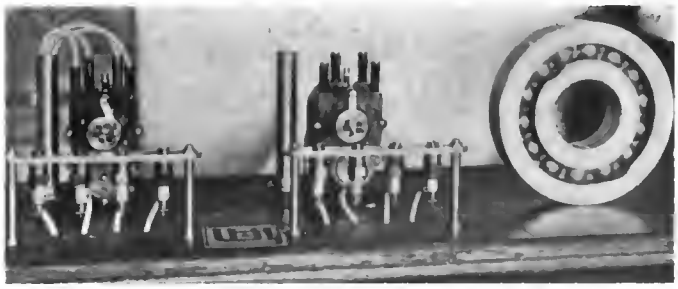
Where the Original Panhard Oil Made Its Display.

The other case held a rather unique and most interesting exhibit of the various numbers in the oil refining series, including waste and other undesirable products. By showing the process and undesirable constituents alongside of the pure finished product, the effectiveness of the latter was doubled. This is an oil that was developed for racing purposes where the question of price does not enter. In this line the oil has been uniformly successful, the first three cars in the Vanderbilt Cup race and the first five in the Savannah Grand Prize race being users of this product. No expense is spared in the factory production of this oil on the supposition that once a Monogram user always a Monogram user.

George A. Haws, New York City.—"The Oil that will not Char," the old standby Panhard in the familiar checkerboard cans, was shown, the three grades being exhibited in simple form, but the red cross-barred cans formed the greater portion of the exhibit. Every owner and driver of a car should be made to realize, early in his autoing career, the extreme importance of good lubrication, and that the use of the best grades of oil is the only safe policy to follow. In the line of well and carefully made products, containing no free tarry matters without lubricating value at high temperatures and with the inevitable decomposition, this product stands forth in a class distinctively its own. The adoption of the sealed spout on the can, preventing the substitution of inferior products, is one that cannot be commended too highly. In these days of bargain, fire and other "wonderful" sales, anything that absolutely insures the identity of the product is a welcome change to the grateful autoist. In connection with Panhard oils and lubricants in general, attention is called to the fact that "light" as applied to oils refers to the gravity and not to the color, so that the lightest colored oil is not of a necessity the best. A little folder which this company is distributing gives, besides a full list of well-known cars and the correct grade of oil for use thereon, a series of trouble preventers under the heading, "Useful Hints."

White & Bagley Co., Worcester, Mass.—The products of this company bear the euphonious titles "Oilzum," "Cleanzum," and "Washzum." The last is a linseed oil car soap for washing cars. This is said to wash easier, quicker, and cleaner than other soaps, besides improving the luster of the varnish. "Cleanzum" is an antiseptic hand cleaner, put out in large 10-cent cans. The first-named, "Oilzum," is, however, the principal product. This is an absolutely carbonless cylinder oil and is made in five grades, one for White steamers, one for Stanley steamers, and three other grades for gas engines. These are a heavy oil for air-coolers or low compression motors, medium for particular use on splash systems of lubrication. The third or light-bodied oil is intended primarily for cylinders. This is especially useful with tight-fitting pistons and for Winter use in all forms of cylinders. The carbon test of a pair of valves shows the big advantages of the product, one with a common oil showing carbon deposits after 150 miles running, while at 4,000 miles the valves with "Oilzum" were as bright and clean as when new. A little booklet, entitled "Oswald, the Chauffeur," is being distributed. This is a neat little love-story in which "Oilzum" plays an important part, and is told in the vernacular of the streets.

W. C. Robinson & Son Co., Baltimore.—In the selection of a good oil, the autoist should be guided by its record in the past, the appearance of it, and the feel. The last two were clearly shown to the people in this exhibit where five grades of the well-known Autoline oil were allowed to run from one series of cans to another over a plate of glass. Beneath this was placed a series of electric lights so that the appearance of the oil could be clearly seen. The troughs in the glass through which the oil ran were open so that one could feel of the oil. As to its past record, the company has been in the business for many years and "stands pat" on its reputation. This exhibition was a striking one, which drew an interested crowd at all times.



U. & H. Magnetos and F. & S. Bearings—Bretz Co.

Vacuum Oil Co., Rochester, N. Y.—Under the tradesmark of Vacuum Mobiloil this company has established a world-wide reputation for its product. The latter is made in five grades and a cup grease. Featured at this stand and particularly applicable at this time of year is the new oil which has been brought out very recently. This will bear the high-sounding name of Gargoyle Mobiloil Arctic. Its special features are non-carbonization, zero cold test, and will feed through any lubricator in any weather. The cold test feature is the one which makes the latter claim possible and really is a very desirable one from any point of view, for one may reason if any oil will work well in zero weather it must work as well and probably better in warm weather. A neat little 5 by 6 catalogue, distributed at this booth, gives pictures of the Vanderbilt and other famous races. In the back of this four-pages devoted to emergency notes and three on sparks, are followed by a list of no less than 500 American and foreign cars, a grade of Mobiloil being recommended by each.

W. P. Miller's Sons, Long Island City, N. Y.—At a commanding position in one of the balconies was located the extensive showing of this firm's "Pan-o-lite" and excelsior automobile cylinder oils, excelsior Fiberous oil, and Miller's grease. This booth shows the characteristic energy of this firm which last Fall was displayed equally well in another way. This was at the scene of the Vanderbilt Cup race, where this firm was the only one to establish an oil camp to supply contestants with oil during the race. A series of postal cards showing several views of this camp were distributed.

W. R. Winn, New York City.—Not to be outdone by larger exhibitors with more space this maker had his small space very attractively arranged. The showing consisted of a line of gas engine cylinder oils in four grades, several grades of steamer oils, and a hand soap. The latter known as "Cleaneasy" is useful for all other purposes as well, but for the hands the writer knows it to be a very effective and efficient cleanser, in which respect it lines up to its name and "cleans easy." An extremely convenient and practical idea is the sale of snow white cotton waste in one-pound closed packages saving thereby labor, time, and material to the small dealer, besides being an excellent way for autoists to carry it.

IGNITION SPECIALTIES, COILS, PLUGS, SWITCHES, ETC.

American Electric Fuse Co., New York City.—The American Igniter combines within itself timer, coil and high-tension distributer. The whole is contained in a hard rubber case about four inches in diameter and three inches deep, and is connected on one side to a storage battery and on the other directly to the spark plugs.

E. M. Benford, Mt. Vernon, N. Y.—The "Monarch" line of ignition specialties comprises spark plugs of both the mica and porcelain types and a roller-contact timer. In the latter, both roller and contacts are made of imported tungsten steel, which is claimed to eliminate all wear in these parts. The ground connection is through a spring plunger in the cover bearing against the end of the shaft. The body is a solid piece of fiber enclosed in a nickel-plated shell. A special plug has been brought out for use with magnetos, in which the insulation, of mica, is twice the usual thickness.

R. E. Hardy Company, New York City.—A novelty at this stand is the combination spark coil and plug. The coil is mounted on the outer end of the plug in a tubular casing of non-conducting material. One master vibrator and condenser is used with any number of these plugs. Only the primary wiring is exposed. This system has been in use experimentally during the past two years with perfect success. It is said to be especially desirable for marine engine work. The standard line of "Sta-Rite" spark plugs is also shown.

Lavalette & Company Showed Their Goods Here.

High Frequency Ignition Coil Co., Los Angeles, Cal.—The Seeley ignition system shown here mounts the spark coils on the cylinder heads in individual fiber cases about two inches in diameter and an inch and a half deep. They connect to the spark plugs through short brass strips. The system operates on eight ordinary dry batteries, and is claimed to draw only one-tenth of an ampere. It has no vibrators or other moving parts except the timer.

Mica Core Mfg. Co., New York City.—Two new ideas in spark plugs may be seen in this exhibit. In the "Eccentric" plug the spark gap is adjustable by turning the central electrode. The inner end of the shell is bored eccentrically, and the sparking point projecting at right angles from the electrode is by this means brought towards or away from the shell. The "Cirkle-Fyre" plug is of the closed end type and the central electrode is formed with a head at its lower end that will just pass through the opening of the shell. When the core is placed in the shell a circular spark gap is formed. The Raves timers and distributors are also shown.

Never-Miss Spark Plug Co., Lansing, Mich.—This company exhibits the well-known "Never-Miss" plugs in magneto and battery styles, all of which are guaranteed for one year. A novelty is their small clock intended to be fitted to one of the spokes of the steering wheel.

NAME PLATES, ETC.

Chandler Co., Pittsburg, Pa.—Name-plates and monograms of all descriptions are shown at this stand. They are made by a number of processes—stamping, casting or acid etching, according to the nature of the work required. The exhibit comprises specimens of each of these varieties, in the shape of name-plates for motors and gear-boxes, dashboard name-plates and license plates, names in special designs for demonstrating cars and initial monograms for individuals owners. In fine, it is an exhibition of name-plates along stock lines, or specials.

MATERIALS AND WELDING.

Erie Foundry Co., Erie, Pa.—Castings, gray iron castings, cylinder castings, in fact it would be to repeat the word casting as many times as there are kinds of castings in an automobile if reference is to the kind that look good, are made of good materials by a process which augurs for quality. Cast vertically, of a uniform thickness of walls, due to the fine core work and to the fact that the Erie is with the requisite experience, the specimens to be examined at the Garden are as a drop in the bucket by way of an approximation of what can be done in a foundry which is equipped for the work and caters to the automobile trade.

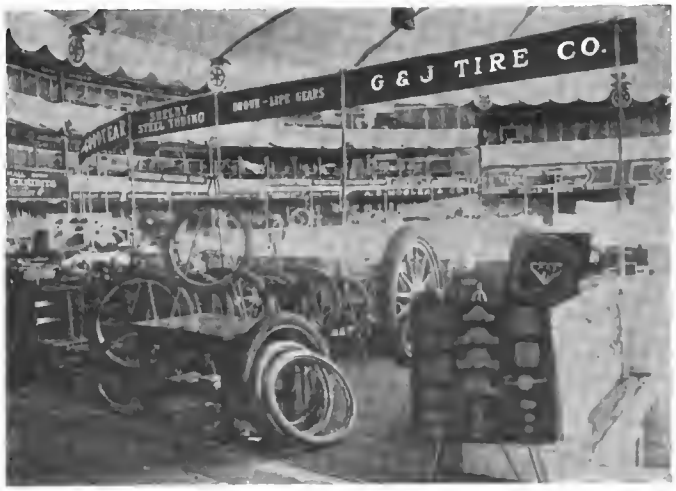
Thos. Prosser & Son, New York City.—It will be remembered that this well-known company represents Freid Krupp, A. G. Essen un Ruhr, and the display at the Garden includes the line of special auto steel as turned out by this firm of German gun makers. The line for this year includes spring steel of the better grades, as well as the usual run of Krupp chrome nickel steel; then there is the line of nickel steel, and die forgings in all the well known Krupp grades. In side frames the company reports considerable activity, using the well-known grades of Krupp steel for the purpose. The autoist who has the time to go to the Krupp exhibit will be able to see the extent to which alloy steel can be deformed without fracture, which is the sign of quality. Nor will it be a sign that the steel can be deformed easily. As a matter of fact, some of the steel resists on a basis of even 220,000 pounds per square inch when it is treated, and even in such cases the elastic limit is as high as 200,000 pounds per square inch. On the other hand, much of the steel is relatively soft, and the tensile strength can be as low as 100,000 pounds per square inch, with the elastic limit somewhat below this point. In all cases it is the claim of the company that the elongation and the kinetic properties are held at a very high point in the grades of Krupp steel used in automobile work.

Davis-Bourneville, New York City.—This exhibit is one that attracts a good deal of notice because the process is new, and it is also becoming of the greatest importance in automobile work. The exhibit comprises examples of the company's line of acetylene generators, with oxygen tanks to go with them, as well as regulators and the detailed parts such as will enable anyone to weld parts of any material. Cylinders are repaired by this process, aluminum cases are made as good as new, and in fact there is no part in an automobile that cannot be fixed by the process; even a crankshaft can be mended. Oxy-acetylene cutting is of the greatest interest, and the "artist" at the Garden will tell all about it.

TOOLS THAT MAY COME HANDY.

Cook's Standard Tool Co., Kalamazoo, Mich.—A line of "jacks," all with reversing levers as the 1909 feature. That the reversing lever is a decided advance on the old button idea is assured, the proof of which lies in the fact that autoists cluster around the booth and praise the new one for its close conformity to the needs; as every autoist sees it instantly he adds experience to his list of accomplishments. In this line of jacks the lifting is done on the downward stroke only, and the upward stroke is free.

Pratt & Whitney Co., New York City.—This company is so well and favorably known as makers of tools of every description for use in the manufacture of automobiles, and, in fine, everything, that it will be of more than passing interest to the autoists and the makers of automobiles to be able to meet the representatives of the company and examine the fine exhibition there to be seen. The 16-inch geared head engine lathe used in so many of the shops of the makers of automobiles is probably of the greatest interest, unless it is a fact that grinders are still regarded in the light of novelties. At all events, the thread milling machine is something to take a close look at, and the "splining" equipment is of the greatest value.



On the Balcony Where Parts Makers Flourished.

Duff Mfg. Co., Pittsburg, Pa., makers of Barrett jacks in all sizes up to the jacks that handle 10,000 pounds with the greatest ease; the company is at the Garden with a fine display. The importance of good jacks is not to be overlooked, and the "Barrett" is too well known for good qualities to be regarded in any but the clearest light. Take the Barrett Junior, for illustration; it is for use on runabout types of cars, gives a clear lift of six inches, and is of a size to allow of adjusting into place with ease. The new reversing lever on Barrett jacks is a feature to be appreciated by autoists who have had to do with jacks that were not so provided. With this lever in a position to be reached with ease—and since it is long enough to enable the motorist to reach it—the troubles of reversing are no more. There is a Barrett jack for every size of car, and it can be seen at the Garden.

MOTORS.

American & British Mfg. Co., Bridgeport, Conn.—At the Garden this company has a line of motors such as will undoubtedly attract the notice of builders of automobiles of the better grade. While in a sense, all motors look very much alike to the casual observer, the fact remains that the motors of the make in question at the Garden look neat, are of light weight,

Shelby Steel Tubing in Every Form and Size Was Shown.

and the materials used in them are quite up to a fitting standard. The line of motors are on the conventional design, and the company will fill any requirement as to the number of cylinders. The sizes range between 22 and 60-horsepower, using four and six cylinders, depending upon the size. All the motors have a one-piece crankshaft, cylinders are in pairs, valves are on one side, crankshafts are of special steel, heat treated to afford the most pronounced kinetic qualities, and the valves are of special nickel steel. The 26-horsepower motor is with cylinders 4 inches square, and it is adapted for use in cars of the class requiring a stable power plant that does not run into weight.

Brennan Motor Mfg. Co., Syracuse, N. Y.—In the middle of one side of the balcony the very large space allotted to this progressive firm is filled with the various types of engines and transmissions built by this concern. This exhibit is unusually complete in character, including as it does one six-cylinder, three four- and one two-cylinder engine as well as a selective type transmission. The whole modern trend toward six-cylinder motors gives this engine the most prominent place and it receives as well the greatest attention. The construction of placing the inlet valve directly over the exhaust valve permits of a design which it is asserted protects the valves from over-

Engines and Transmissions from the Brennan Works.

heating, pitting, or warping, avoids unnecessary openings to the valve chambers or cylinders, avoids unnecessary large pockets or chambers, making a motor that is efficient and economical in fuel. The cylinders are individual. The inlet and exhaust valves are mechanically operated from the one camshaft. The crankcase, made from the very best grade of aluminum, carries seven bearings for the crankshaft. All bearings are made from the very best white bronze, guaranteed not to score or cut. If desired the camshaft, crankshaft, rods and pistons can be removed without disturbing the motor from its mounted position; in addition, there is the usual large hand-hole plate in the side of case for adjustment of rods, etc. Lubrication is by force feed system, pumping the oil from the oil reservoir under the crankcase through tubes running to the various bearings. The surplus oil returns to the reservoir through the overflows in the crankcase, maintaining a constant level in the case and insuring even lubrication.

LAMPS TO SHOW THE WAY.

R. E. Dietz Co., New York City.—The very complete line of lamps shown leaves nothing to be desired in the lamp line. This includes mirror lens searchlights, flare-front headlights, searchlights and square dash lamps. The line is unusually complete, and the various pocketbooks are catered to as well, lamps at all prices being shown. The principal large lamps shown are 8-inch Superior searchlights, which live up to their trade name of Superior in every quality worthy of mention. The Sterling and Sterling Junior square side lamps are of a very handsome pattern, made of the finest of heavy materials, and made to last. These are guaranteed to burn well at all times and may be had in polished brass and other standard finishes.

Manhattan Screw & Stamping Works, New York City.—One of the big problems of the lamp maker has always been the reflector; the all-glass has its faults, as has also the all-metal reflector. The manufacturer of Phoebus lamps has apparently hit upon a happy solution of the problem in the double focus reflector, which is of both metal and glass so constructed as to eliminate the poor features of both. This is designed to project the central rays horizontally, while the side rays rapidly diverge. The method in which this is accomplished is by the use of a plano-convex lens in the center of the mirror, this permitting a shorter focus than is otherwise possible. Thus the much-sought-after long central rays are projected far in advance of the automobile.

Rose Mfg. Co., Philadelphia.—The features of the Neverout patent motor and other lamps are the Mangin mirror used and the lens searchlight projector. As speaking well of the manufacturing processes in their factory and the care with which the parts are handled, all of the product is sold under the guarantee of satisfaction or money refunded. Besides a full line of all kinds of lamps and searchlights of the ordinary type, an additional line of combination headlights is made, consisting of a Neverout headlight, in combination with a patent hydro-pneumatic safety generator, the two constituting a complete outfit. These have a fine appearance as well, so as to be suitable for large and costly touring cars as well as on the smaller and less expensive machines.

SHIELDS, TOPS AND BODY MOUNTINGS.

Blue Ribbon Auto & Carriage Co., Bridgeport, Conn.—Bodies are shown here in either wood or metal to meet any requirement or taste. Especial care is given to the selection and completeness of interior fittings and equipment. There are also good examples of the latest designs in close-coupled and toy tonneaus. The company also makes cape tops, windshields and other fittings.

L. C. Chase & Co., Boston.—A complete line of waterproof fabrics for tops, etc., is shown here, in all colors and weights and in single and double texture. Lap robes and other similar articles also form part of the exhibit.

Chicago Windshield Company, Chicago, Ill.—The object of this company is to make shields to meet every possible need, and to this end a great variety of types are listed. On the latest models the glass is framed in square brass tubing which gives a very neat appearance. As side lines the company handles tire chains and a combination trouble lamp and cigar lighter.

L. J. Mutty Co., Boston.—Mutty's top fabrics are favorably known to all who have occasion to make use of such products. They have no startling novelties to exhibit, but continue to make the lines which have given satisfaction before.

Springfield Metal Body Co., Springfield, Mass.—The Springfield exhibit consists of four beautifully finished bodies of different types. There is one of the popular baby tonneaus, finished in gray with red upholstering, in which the driver's seat projects some three inches ahead of the other front seat, thus giving the driver more elbow room; the only door to the rear seat is on the right. Two touring car bodies are shown, a seven-passenger in dark red and black, and a smaller one in bright yellow with black upholstering, giving a very striking effect. A handsome extension landaulet is finished in a deep, rich green.

Vehicle Apron & Hood Co., Columbus, O.—Waterproof fabrics and the articles made from them form the subject of this exhibit. As an indication of the extent of the "Gordon" line it will be enough to mention their tire covers, both buttoned and laced, top covers, tire sleeves and inner patches, covers for lamps of all kinds and sizes, tool rolls, inner tube cases, aprons and lap robes.

EXHIBITS OF VARIOUS KINDS FOR VARIOUS USES

H. A. Allers & Co., New York City.—"Solarine" is the subject of this exhibit, and its merits are interestingly set forth. It may be used for polishing any sort of metal work, and as it contains no grit, acid, grease or poison is absolutely harmless.

A. O. Brictson, Brookings, S. D.—"Can't come off" is the claim made for the Brictson detachable tire tread. This is a protector for pneumatic tires, made of chrome leather and canvas, with steel studs on the tread to prevent skidding and take the wear of the road. It is held in place by air pressure between the tire proper and the rim.

M. H. Cormack & Company, New York City.—This company is the New York distributor for a number of accessory makers. One of the devices shown is the "Break-Circuit Auto Lock," a switch for either electric or gasoline vehicles controlled by a Yale lock with individual keys. The Fry spark plug, claimed to be practically indestructible, is a praiseworthy novelty in that it sells at about half the usual price. The company makes itself the "Cormack" combination grease and oil gun, in which the grease is expelled by a powerful, quick-acting lever device.

Commercial Acetylene Company, New York City.—Not the least of the scientific ideas advanced and proved in the past year has been that of "autogenous" welding. This is based upon the idea that a proper mixture of acetylene gas and oxygen will produce a higher temperature even than the better-known oxy-hydrogen flame. This company has a welding process which utilizes this principle, and cylinders, a crankcase and a large front axle, as well as a number of small parts, are shown which had (after breaking) been welded by this process. In addition the company is the owner of the Claude & Hess patent covering the storage of compressed acetylene dissolved in acetone, under which patent they have licensed the Prest-O-Lite Company.

G. L. Economizer Co., New York City.—The makers of this device believe that most carbureter trouble is due to the fact that the pressure in the float chamber and the suction at the nozzle are in constantly varying proportion. The "economizer" consists of an adjustable air valve or plug, which is screwed down to the cover of the float chamber and connected to the inlet pipe by two small tubes, one above the throttle and one below. A slight suction is thus created in the float chamber, holding the gasoline at a constant level in the spray nozzle. The device is adaptable to all makes of carbureters which embody a float and a throttle, and is claimed to improve the running of every kind of gasoline motor.

Hill Dryer Company, Worcester, Mass.—Of all the indispensable accessories for an automobile none are more useful than means for the proper handling of gasoline. This company shows gasoline funnels fitted with fine brass screen and a band at the top to hold a piece of chamois; also gasoline measuring cans in both the two and five-gallon sizes. Then there are the oily waste cans of galvanized iron for garages. These are fitted with a self-closing top and are riveted together so that heat will not affect the seams. They are made in four sizes, three for small or private garages, and a larger one for public garages. Any one of these sizes being endorsed by fire underwriters should be a good "buy." This firm, in addition, makes, but did not show, an automobile drip pan. It is of heavy galvanized sheet steel with a heavy steel rod inside of the rim. This latter is turned in, thus leaving no cracks around the edge. Made in two standard sizes for runabouts and large touring cars; larger sizes will be made to order at any time.

Jarman & Baker, New York City.—"The life of your tires depends on the care you give them." Many automobilists might well think over this warning, and incidentally consider the "Little Wonder" vulcanizer. The latest model of this useful little device is provided with an electric heater, which may be attached to any 110-volt lamp socket.

Leon Mann Co., New York City.—Different from the usual run of exhibitors in that clothing only is shown. The effectiveness of this is doubled by the use of lay figures, showing at once the appearance of the garments in actual use. Priestley's cravenetted cloth is shown in many varieties. These latter include Roseberry auto cloth in plain and fancy designs, and a wide range of khaki and other colorings. This fabric is woven at the famous Priestley mills at Bradford, England, especially for the automobile trade. Another strictly Priestley weave is in English mohair, also in all designs and colors. These made up in dusters or entire suits will shed dust, will not spot or wrinkle from rain, and are both cool and comfortable in warm weather.

John Lucas & Co., New York City.—Lucas "Auto-Klean" is claimed to be "the only" polish made especially for use on automobiles. It is put up in dust-proof cans, thus avoiding the danger of scratching the polished surfaces by the accumulation of dust or grit in the can.

Morrison-Ricker Mfg. Co., Grinnell, Ia.—The makers of Grinnell "Rist-Fit" gloves show a complete line of their product in several styles. For summer wear there is a ventilated glove in which the hands are kept cool and comfortable by tiny perforations across the back and fingers—too small to admit dust, but large enough to admit a current of air. All have the "Rist-Fit" feature, which consists of a strap with a special fastener to draw the glove tight about the wrist. A V-shaped piece of soft leather inserted in the cuff takes up the slack and prevents wrinkling when the strap is tightened.

New York Sporting Goods Co., New York City.—At this stand special prominence is given the Holley carbureter and magneto, and the Pittsfield coils and spark plugs, for which this company is the New York distributor. There is also shown a line of "Empire" non-sulphating batteries and "Helix" flexible shafting and wire coil belting. A novelty which should find a good sale is their rubber steering wheel grip, which consists of a corrugated casing of red or black rubber completely covering the rim of the steering wheel, with laces to draw it together on the inner edge. It should give a very firm grip for the hands.

Post & Lester Co., Hartford, Conn.—The feature of this exhibit is what is claimed to be the largest automobile horn ever made. It stands about eighteen inches high, and looks as if it had been requisitioned from the orchestra upstairs. In addition to acting as distributors for a number of other makers, the Post & Lester Company manufactures a number of specialties in its own plant. Among these may be mentioned the "Moto-Cle" wrench set, a neat-looking windshield, and a line of lamps in which the reflecting lenses are arranged to give both diffused light and a strong beam to show the road at a distance.

Supplementary Spiral Spring Company, St. Louis, Mo.—These easy riding adjuncts to the ordinary flat leaf spring are shown at balcony space No. 247 in particular and on many of the cars in the show. It is claimed for these that they prevent breaking of the side springs, eliminate all spring trouble, insure comfort and safety and save repair bills as well as tires. These are rather big claims, but on the word of a man who has used them, they are none too big. The springs are all right and should be on every car. They are so constructed as to be used in any one of a number of positions with half elliptic or platform springs at the front or rear end, above the spring end or below. Their real mission is to take out the small vibrations, the little jolts which are so unpleasant, and they do it and do it well. In no sense of the word are they a substitute for or a competitor of the flat leaf spring, but serve to amplify the latter.

Valentine & Co., New York City.—Valentine's varnishes are familiar to all users of such materials. A special color card has been brought out, showing the shades most suitable for automobile use. Special colors are also made to order.

Sure-Footed Progress as Typified by the "Ship of the Desert"—Mural Decoration in Balcony.

THINGS HEARD IN AND ABOUT THE BIG GARDEN

For the Summer Bride.—"Oh, that's for a Summer bride, and that one over there for Winter," delightedly [illegible]ed a fair visitor to her escort on viewing the Packar[illegible] in bridal array, and then pointing over to the Pierce [illegible]. It seems to be taken for granted that any car with an [illegible] delicate finish, such as the Packard exhibit has [illegible] as a feature during the last two or three shows, must natt[illegible] intended as a bridal car. The men take a more practical view of it, but their comments are equally interesting, as note that of the man who said he'd be jiggered if preparing an automobile show exhibit had not been raised to the grade of an art when even the tires on the Packard "bridal" and the Packard show chassis were specially finished to carry out the effect made by the rest of the machine.

Every Man His Own Designer.—When it comes to buying a Studebaker car, "Every man is his own designer" where the matter of body design and finish is concerned, the Studebaker line being the furthest removed from standardization imaginable in this respect. This may easily be noted by glancing at the cars forming its exhibit. No two of them are alike and none of them is exactly like any other car to be seen on the floor. The greatest novelty in body design to be found in the show is the Studebaker suburban with its four-seated body of curly maple and wickerwork, while the brocaded satin interior of the Studebaker limousine, which is a study in nile green, is another of the artistic *pieces de resistance* of the show whose list price runs up into five figures.

Knox Exhibit Comes Over the Road.—"Just see what we lose by not having a wideawake publicity man," said a disgruntled attache at the Knox exhibit. "Everything in our big commercial exhibit down in the basement came over the road in midwinter, all the way from Springfield, Mass., under its own power, and no one has even heard so much as a peep about it. With snow and ice on the ground and the roads badly cut up, a run of 150 miles by commercial cars carrying overloads ranging as high as 50 per cent beyond their normal capacity is something worth while talking about, even in this day of record performances. Why, one of our 3,000-pound light Knox trucks brought a load of 4,800 pounds to the show all the way from Springfield without so much as hesitating once on the road."

Trail of the Non-Skid.—To judge from the tire equipment of many of the cars at the show, "the trail of the Firestone non-skid will be over the land" during the coming season, and as every turn of every wheel on the car prints its message as it rolls, the trail will be an unending one that will not be difficult for the initiated to decipher. If Firestone non-skids didn't become too common it might be a good idea to use them on a pacing car or guide instead of the usual confetti, was the suggestion offered by one observer. And it is one of considerable merit for the letters on a new Firestone non-skid tread are raised in such a manner that a clear and easily readable imprint is left on anything but the very hardest of roads.

First Sale of the Show.—The honor of having made the first actual sale of the show is claimed by the Chalmers-Detroit forces, and that there is considerable merit to the claim is to be seen in the fact that the sale was made almost before the show was well under way. According to Treasurer Roy D. Chapin, of the company, the Chalmers-Detroit sales forces also expect to make another record by selling the largest number of cars during the entire week. The question, "What is the Chalmers-Detroit made of?" is well answered by the sectional chassis which is shown in action at the booth and forms one of the main points of interest of the entire main floor.

Walter Thompson.—The Philadelphia Storage Battery Co. has a fine display of storage battery equipment for electric vehicle work under the trained direction of Walter Thompson, who reports a good demand for batteries, and it is worthy of note that the batteries of this make include light, medium, and relatively heavy plates, for use under the different conditions to be satisfied. The heavy plates, so called, are not heavy in the sense that they are related to stationary battery plates; they are simply heavy enough to handle certain classes of electric vehicle work in which high rates of discharge do not have to be considered and the life of the battery is prolonged.

The Cadillac Crowd.—"What's the crowd over there?" was the first question the average visitor asked when half-way on the first round of the main floor to the right he came in sight of the mass of people at the Cadillac booth. And just as a crowd draws a crowd, every one who saw the aggregation there immediately hastened to add his presence to it. But unlike most curiosity seekers, those who were thus drawn stayed to have the details of the new Cadillac "Thirty" made plain to them before getting away again, so that there was always a crowd about the Cadillac exhibit usually so thick that it was next to impossible to find any one connected with it.

The Man from Maine.—The E. T. Burrowes Company is adequately represented by C. H. Calkins, who takes a wide interest in the advance of the industry along conservative lines, and among other things looks in on the doings of the Society of Automobile Engineers when the opportunity affords.

Dog and Fuel Can Have Since Changed Places.

A Walking Commercial Car from "Afric's Sands."

Presented Plate to Selden.—At a luncheon Tuesday noon at the Prince George Hotel, E. L. Thomas, of the Thomas Motor Company, presented George B. Selden with the Selden license plate from the victorious New York-to-Paris car. Mr. Selden made a brief reply, telling of his experiences in constructing the first engine, and compared the round-the-world trip to that of Magellan who circumavigated the globe. Others who spoke were George Schuster and Fay L. Faurote, of the Thomas company: W. H. Humphreys, of the New York *Evening Post,* and Richard Bacon, Jr., of the Haynes Automobile Company. Dr. C. G. Percival made an efficient toastmaster.

The Pierce Boudoir Car.—It did not take the fair sex long to christen the Pierce Great-Arrow $12,500 creation of art. "Why, that's a real boudoir," exclaimed one of its early admirers, and it has been known by this designation ever since. To add that it is the *piece de resistance* of the show as a whole is to put it mildly, for a current quotation was, "You haven't seen the show unless you take in the Pierce beauty." It required a goodly part of the time of several of the attendants at the Pierce exhibit to explain the details of the artistic interior.

Will Not Discontinue Steamer.—One of the annual reports and one that crops out each year at show time, is about due to appear now. According to Windsor T. White, of the White Company, this is the usual time for the rumor to circulate that the manufacture of steamers will be discontinued. This nine-year-old rumor never fails to show up, and this time the White Company is discounting it and its effects by denying it in advance. According to President White, the company has no intention, plan, nor inclination to discontinue the White steamer.

Continentals for Hotel Decorations.—Probably the last place in the world where a person would look for automobile tires is in a swell hotel. Yet the automobile's indispensable footwear will be found in at least one New York hotel, the Astor using them to complete the decorations for show week. These tires have been selected because of popularity, which those who sell them insist is due to the great mileage and constant satisfaction afforded to owners.

Doings at the Simplex.—In East Eighty-third street, New York City, the Simplex Automobile Company, is making preparation to fill the orders which are sifting in from the Garden, and G. E. Franquist, the designer of their well-known car, reports everything in order for a busy year. In addition to the cars of this well-known make, the designer has well in hand all the special gigs, tools, dies and fixtures to assure good results from high grade materials on a basis taking into account accuracy of fit, and, what is more to the point, the perfect duplication of parts.

The Timken Roller Bearing Company.—The average spectator at the Garden is curious to know what the "big" front wheel knuckle is for. Many of them reach the conclusion that it is just as a sample of the bearings. They overlook the fact that in trucks it is not easy to steer if the knuckles offer much resistance to turning. The Timken plan is to provide roller-bearing knuckles in places of this sort. The new 1,500-pound Timken front and rear axles are attracting more than a little notice. They look quite up to the standard known as "fit," and bear the earmarks of careful construction.

Interest in the Exhibition.—The best way to prove the absorbing interest in the Garden and its contents is to go there during the hours when it would be reasoned that the patrons would not be there. Surprise waits the experimenter, for as a matter of fact there is no time during which the Garden is depleted of a vast count of spectators. Naturally it is reasoned that the real buyers try to have a good look at the cars at a time when the spectators are in less presence. The truth is there are so many of them "on the same tack."

The Chalmers-Detroit in Action.—A stop at the booth of this company was of more than usual interest due to the fact that the exhibit had a motor turning over, and it was in section to show the working of the Chalmers-Detroit ideas. It was explained how a motor can be short, thus leaving the body with more room. It was pointed out how a crankshaft can be with two bearings and be the better for it. On the whole it is a quarter of an hour that could not be expended to better advantage.

Decorative Scheme Above the Accessory Makers—Suggestive of Primitive Transportation Methods.

Concert Hall—An Aisle in the Accessories Section.

A Queer Car Starter.—"How on earth do you manage to start your car with that thing?" asked a puzzled inquirer of one of the attendants at the Winton booth, referring to the small brass cap employed to keep dirt out of the opening for the crank, which on all Winton cars is carried in the tool box. He had first taken hold of this small projection and after vainly trying to turn it, had given up and sought information. He went away considerably enlightened after being initiated into the mystery as well as the delightful convenience of the Winton self-starter. One of the Winton cars is a magnet for those who have to see, smell and feel everything in order to satisfy themselves of its identity. This particular car is a Winton six-cylinder roadster with a delicate cerise finish, the upholstery being of a tint resembling very closely the ordinary aluminum paint. The result is that every one who comes anywhere near the car goes up to it and rubs his finger on the leather to see if the finish will come off, affording no end of amusement to the Winton attendants.

Peerless Shows Its New Metropolitan Home.—"Yes, it is something that we are proud of and something that New Yorkers can take pride in as well," said L. H. Kittredge, president of the Peerless Motor Car Company, referring to the architect's water-color drawing of the façade of the building now under construction for the New York branch of the Peerless company at Fifty-seventh street and Broadway, directly adjoining the Tabernacle. In fact, the building is L-shaped, and surrounds the latter structure, having a frontage of 75 feet on Broadway and of 25 feet on Fifty-seventh street. It is to be nine stories in height, and will be one of the most prominent landmarks along automobile row. Speaking of its completion, Mr. Kittredge said that his company expected to be able to occupy it at the opening of the selling season for 1910, or about September next.

Explaining the Two-Cycle.—It would seem from many of the remarks heard in the vicinity of the Elmore booth that a great many people have still to learn something, if not a great deal, about the gasoline motor, if their knowledge of the simplicity of the two-cycle motor may be taken as a criterion. Many apparently have no idea whatever what the term "two-cycle" means at all, and the attendants at the Elmore exhibit are kept busy showing, by means of the sectional chassis of the Elmore car on view, just what the functioning of the motor is and how it compares with the four-cycle motor. But few of the visitors fail to be impressed with the great lack of small moving parts that characterize the Elmore motor, once the method of its working and the extreme simplicity of its design and construction are made clear to them.

Another Unusual Exhibit.—Where so many unusual features were present it was only a matter of looking around to find still another. At the Stearns exhibit was shown a toy tonneau that took very well with the ultra-critical crowd. This was finished in gray with black striping, while the upholstering was in natural kid with no tufting. The effect was very pleasing and the extra seat on the running board for the chauffeur received favorable mention. The small limousine or town car on the 15-30 chassis is a well-worked-out replica of the larger and more luxurious cars. Sales Manager Charles B. Shanks occasionally took a hand and told a customer Stearns points in a way that was convincing.

"Who's This Pope Toledo?"—"Who's the present Pope?" asked one Hibernian visitor of another at the show. "Pope Pius the Tenth," was the ready answer of his companion. "Well, who'll be the next Pope?" came the query. "And how can I tell that now?" "Well, what's all this Pope Toledo and Pope Hartford we're hearing so much about? Do they come from Rome?" The story has been going the rounds of the show and affording no end of amusement for the attendants at the exhibit of the Pope Toledo. Needless to add, they have been doing their share to keep it in circulation.

Connecticut Spark Coils.—Just as a reminder of the quality of "Connecticut," the Connecticut Telephone & Electric Co. is handing out to its friends and patrons a "diary" for 1909, the quality of which is quite up to the quality of the ignition devices of this company. E. C. Wilcox, of the firm, who attended the meeting of the Society of Automobile Engineers while in town, reports that orders are directed to Meriden, Conn., on a basis quite up to the best expectations, and that the factory is extremely busy in consequence.

Thomas Cars Could All Go Round the World.—The Thomas New York-to-Paris, or as it is now styled, round-the-world car, attracted many who had not previously seen it and many more who went for a second and third look. At the Thomas exhibit Advertising Manager Fay L. Faurote stated that every one of their cars is built good enough to repeat the performance on just as short notice if the necessity should arise.

Advertising Managers Are in Evidence.—Most of the managers of the advertising departments of important concerns are more or less in the big Garden. The list includes such well-known experts as E. Ralph Estep, of the Packard; C. W. Mears, of the Winton; R. H. Johnston, of the White; Fay L. Faurote, of the Thomas; E. LeRoy Pelletier, of the E-M-F and Studebaker; and George Davis, of the Pierce.

Press Agent Jervis on the Job.—Though not feeling as fit as he would like to be, A. N. Jervis, the dean of press agents, is pluckily sticking to his job, but after the conclusion of the show will take a well-earned rest. He says that the demand for "courtesies" has far exceeded anything of the sort that he has ever encountered before, and the excuses offered why press tickets should be supplied range from the sublime to the ridiculous.

FIRST ANNUAL DINNER OF THE M. & A. M.

Last night at Delmonico's the first annual dinner of the Motor & Accessory Manufacturers was successfully held. Job E. Hedges filled the position of toastmaster in his usual flexible manner, and the speakers included ex-Governor N. J. Bachelder, of New Hampshire, Master of the National Grange; William H. Hotchkiss, president of the American Automobile Association; Charles Clifton, president of the A. L. A. M.; Benjamin Briscoe, chairman of the A. M. C. M. A.; H. E. Raymond, first vice-president of the M. & A. M., and A. G. Batchelder, of the Class Journal Company. President H. S. White, of the M. & A. M., introduced the toastmaster of the occasion.

The complete report of the banquet will be given in THE AUTOMOBILE of January 28.

HONORED THE MAYOR OF SAVANNAH.

Tuesday night at Delmonico's, newspaper writers from New York, Boston, Philadelphia and Chicago, who were at Savannah, together with a hundred others prominent in the automobile industry, gave a midnight supper to Mayor George W. Tiedeman, of Savannah, and J. A. G. Carson and Harvey Granger, president and vice-president, respectively of the Savannah Board of Trade. F. C. Battey, president of the Savannah Automobile Club, was a regretted absentee, as was also W. J. Donlan, secretary of the Chamber of Commerce, who gave particular attention to the newspaper writers at the time of the Grand Prize race.

Savannah's Pair.

Mayor George W. Tiedeman and President Frank C. Battey of the Savannah Automobile Club.

E. H. Broadwell and T. F. Moore were responsible for the excellent arrangements for the supper, which included several novelties, and wound up with a vaudeville entertainment. Arthur Brisbane, the well-known editor of the New York *Journal*, filled the role of toastmaster, though John C. Wetmore made one of his usual taking "fireworks" speeches in welcoming the visitors and introducing Mr. Brisbane. Mayor Tiedeman spoke on the "New South"; Mr. Carson's topic was the "Commercial Development of the South," and Mr. Granger said that Savannah wanted another race. And then followed the festivities, which continued until Fifth avenue was deserted.

The list of those present included Chairman Robert Lee Morrell, of the A. C. A. Contest Committee; N. H. Van Sicklen, of Chicago, ex-chairman of the A. A. A. Technical Board, who figured in the successful outcome; and F. J. Wagner, who started the cars on their 400-mile journey.

QUAKERS THINK BIG CARS MAY BE SCARCE.

PHILADELPHIA, Jan. 18.—"Is there to be an actual dearth of cars to fill orders during the coming year?" is the anxious query of not a few of the local "Row" men. Archie Hughes, of the hustling firm of Foss & Hughes, representatives of the Pierce-Arrow, E-M-F "30," and Knox commercials, thinks there is bound to be, and quotes cold figures to prove his claim. "Last year," said Archie to THE AUTOMOBILE representative, "we placed 152 cars, mostly Pierce-Arrows. It was a bad year for most automobile concerns, but with the boom started in mid-November to help out, we came under the wire a winner on the year's business—not by a big margin, it is true, but still a few to the good. In early Fall, while conditions were still bad, we made our arrangements with the Pierce people for the present year. Everybody was conservative to the limit. We shaded our demands about 20 per cent., and the factory people, having the then existing depression in mind, suggested a still further cut. Of course we acceded. The quota of Pierces of all models allotted to us was just 97, and it looked big then. Prayers and petitions to the factory met with little success. We have written every Pierce agent from here to Jericho offering to take all 1909 Pierces they can spare off their hands at once, but have found that in nearly every instance the other agents are in the same fix as we are. Conditions are now so good that had our present allotment been doubled, we would have little difficulty in disposing of them. Yes; I certainly think there is going to be a scarcity of high-grade American cars during the present year."

The claims of Mr. Hughes are borne out by the statement of Sales Manager E. C. Johnson, of the Keystone Motor Car Company, Packard agents. That concern's 1909 quota of Packards is practically exhausted, and while a lucky chance may throw an additional car here and there into their hands, there is no prospect of such a substantial addition to its allotment as would permit of filling all demands. Other habitues of the "Row" are sending up the same plaint, from which it may be gathered that the demand for high-grade cars during the present season will exceed the supply to such a degree as will compel the makers to boost their 1910 output figures to a marked degree.

W. K. V., JR., RIDES ROUND SAVANNAH COURSE.

SAVANNAH, GA., Jan. 18.—"A great automobile course. Those grandstands are just right." These are the opinions of William K. Vanderbilt, Jr., donor of the world's famous Vanderbilt cup, as expressed by him after driving over the automobile course in a big Packard driven by Roy A. Rainey.

Mr. Vanderbilt, who is staying some time at the Winter home of Mr. Rainey, in Bryan county, where he is passing his time away by fishing and shooting, came to Savannah to take a ride around the automobile course where the largest race was ever held, this being the first Grand Prize race. Mr. Vanderbilt went away from Savannah with a good impression, and stated that Savannah should have a big race every year.

Two Champions—Thomas Round-the-World Car and the Locomobile Vanderbilt Cup Winner.

Pressed steel frames are generally heavier than used in America. Axles worthy of mention were the Lancia pressed steel front and the Fiat pressed steel rear casing.

Other axle, radius rod, torque rod and structural details generally were as frequent and variegated as the number of cars of the exhibitors. One car, such as the Hotchkiss, of acknowledged reputation and worth, shows a rear construction, in which all torque and car-driving strains are absorbed directly by the rear springs, whose front ends are anchored rigidly against the frame.

Perhaps as a next door neighbor would be found a car of equal reputation but equipped with radius rods, torque rod or tube (possibly two of them) and all the paraphernalia in any way excusable in such a connection.

The transmission problem would seem little changed, except perhaps for a tendency toward the progressive type on the smaller cars, retaining the selective for the larger models.

Clutches, as before, are cone, multiple disc, contracting and expanding band, metal-to-metal, leather-to-metal and Maverick. Certainly the simple cone type is at least holding its own.

European Fast Small Cars.

Reverting to the small car matters as being of considerable immediate interest to American constructors, upon the face of it, taking into account the extremely high speeds made in recent foreign small car races, it would appear that there exists abroad some magical touch of design, materials or construction, for in advance of anything American.

The real facts, however, are not by any means so discouraging. In the first place, we must remember that the character of European small car contests has been very different from anything over here. Here, except in the case of the last Savannah event, every effort has been put forward to limit the contesting cars to a construction at least approximately in accordance with the regular stock product of the manufacturer entering.

Even at Savannah, where leeway was given the maker along lines of special construction, insufficient time was allowed between the dates of the announcement and the running of the event to permit of the design, construction and test of any special racing car.

It must be remembered further in connection with this event that for six or eight weeks the organization controlling 90 per cent. of the contests throughaut this country was holding over the head of each individual manufacturer the threat of disqualification should he permit a car to be entered.

The Savannah Small Car Race.

Glance for a moment at the Savannah result—a foreign car of a make perhaps acknowledged abroad to be the equal of any car there built—this particular car, a special one, built for racing, lightened even to the extreme extent of frame drilled full of holes, fresh from tests and trials in England, and sent here in perfect condition in ample time to work out over the course—this car in a distance of 196 miles and a total elapsed time of 3 hours 43 minutes 33 seconds, gained a total of 6 minutes 12 seconds over its next competitor, an American stock chassis, and 10 minutes 22 seconds over its next competitor, also an American stock chassis. It is a matter of record how much delay from tire and other trouble was experienced during the race by the three cars. The behavior of the other foreign cars is also a matter of record.

It is conceded that the winning car ran a beautiful race. It must also be conceded that the American cars finishing second and third were both faster than the winner, and that their delays were occasioned by insufficient or improper preparation, in one case at least (the third). It must also be considered that to make the third car eligible in the event it was necessary to reduce the bore of the cylinders, which was done without in any way lightening the stock chassis to keep pace with this reduction of power, all of which must have very materially affected the result. However, this car made the fastest lap (56 miles per hour), was in better running condition at the end of the run than at the beginning and was immediately entered in other events in the South without the least overhauling.

The race was a fair one and was closely contested, the result being in doubt almost to the finish. A little bad luck with tires, and the result might have been different.

A good car well driven won the race. But because this car happened to be a foreign car it is the height of folly to conclude that all foreign stock small cars are superior to the similar product of America. The study of foreign small-car events will show that fully as many cars go down-and-out owing to troubles, minor and major, as in any similar American contest. I do not refer particularly to races, but to contests of all characters.

Freak Small Cars.

As to the construction of the small cars with which phenomenal speed has been developed abroad, the car that was booked to win the "4-inch race" on the Isle of Man had, of course a 4-inch bore, but an 8-inch stroke.

An accident, chargeable to the great speed of this machine, put it out of the running. Other cars have even longer strokes; for instance, the single-cylinder one which averaged better than 65 miles per hour for 100 miles on the Brooklands track was of 4-inch bore and 10-inch stroke.

One of the rules under which American contests have been run during the past year has been that the entrant must stand ready to sell the entry at the end of the race, for the regular price of the stock model of which the car entered is supposed to be a duplicate. It is interesting, as illustrating a far removal from stock properties, that the car last mentioned (there were three of them built) was quoted for sale at a figure in thousands that did not fall far short of the price of the real stock article in hundreds.

These special speed machines are admittedly impossible for stock models. Cars of this freak construction will run just as fast and can be constructed just as easily in America as elsewhere, but piston speeds of from 3,300 to 3,500 feet per minute, the employment of special oils for lubrication, and valves that are nearly as large as the cylinder itself are not factors that can enter into the healthy growth of the stock gas engine for general public utility. Even the makers of these machines shrug their shoulders at the suggestion of such a thing. Extreme vibration, high compressions, lubricating difficulties and a hundred and one other factors render unfit for public use a single-cylinder engine of 4-inch bore and 10-inch stroke, for which an output of over 30-horsepower can be claimed.

American Material and Workmanship.

The matters of material and workmanship do not enter into this equation at all. We have the finest workmen in the world in America. They are not merely machines perfected in the performance of certain labor, but have the advantage of the knowledge that a lively exercise of their brains will be appreciated by their employers. Nowhere in Europe can be found the "suggestion box" or any other of the several systems common to American shop practice, and through which is added to the mutual benefit of the employee and the employer the advantage of the observant eye and the active brain of the "man behind the bench."

We have seen in the past, much money spent by those allied with foreign interests, on the theory that even if the American manufacturer knew what material was right and proper (which was doubtful) and even if he did have this knowledge and chose to use it (which was beyond belief), that he would still be met by the insurmountable difficulty of not being able to get in America the proper metals. Admit, if you like, that in years past, there may have been ground for such statements. It is only natural that in countries such as France, where the motor car first saw commercial progress, that the question of materials should have received early attention. But the above noted theory is now an exploded one. It is my experience that for the season 1909, the American maker knows more in a minute about the quality of the steel in his product than the continental manu-

facturer does in an hour. Abroad, experiments and tests are made until a grade of material is found that will endure in the place it is desired to use it. This sample is then O'K.'d and the steel maker is asked to furnish material according to it. The French designer does not pretend to know the properties, the peculiarities or the chemical analysis of this material; he merely knows that it does his work. The American engineer and frequently the American purchasing agent, must have in his hands all data, physical, chemical and commercial, before an order for any certain material is placed.

Whatever may have been the conditions in the past it is with the present and the future that we have to deal; and the American motor car constructor has ready at hand and subject to call, in this country the equal, if not the superiors, of any of the metals of the world.

It is not in keeping with the spirit of American supremacy that the employment of such materials should be deliberately avoided by our motor car builders.

American Makers Depend Upon Experience, Not Racing.

In the big car classes, the American car has been at a disadvantage in that road racing here has never to any extent occupied the attention of the manufacturers, the American makers, generally speaking, being content to enter the stock chassis of the current year's model against the specially built foreign racing cars, driven almost invariably by men retained on yearly salary for this purpose alone, and whose experience should make them blush to "take candy from a baby"—by defeating the American drivers and cars put up against them.

In saying this, I do not reflect upon the nerve and good intentions of the American driver or the excellent American racing car; they have thriven phenomenally considering conditions here, and proven their surpassing merit in some international large car contests. With the right racing regulations, a large number of splendid, fast American racers would be built and their performances prove the mettle of the American designer in a more impressive and conclusive manner than ever before.

The point I make is that the foreign driver and the foreign racing car have been produced in an atmosphere that never has and never will exist fully in this country of stock car events and hustling production which throttle the idea of special racing car construction as demoralizing and poisonous to the manufacturing end.

In truly stock car events and particularly in small car racing the story in America will surely be satisfactory henceforth. In this newer development, we start in the game at least on a par generally with our foreign competitors, in excellence of machines and with the advantage of business and manufacturing methods that are far in advance of theirs.

Not only in methods and traditions is the foreign manufacturer handicapped, but he is confronted by the equally or even more serious problem of a market. The European countries open to him are small, some of them bankrupt, and certainly all of them, where roads and financial conditions offer some promise, well able to meet the entire demand of Europe from their own factories, at any rate if worked upon the scale possible in America. Therefore, with a few exceptions, the foreign maker cannot produce such quantities as will allow him to realize upon his cheaper labor (less than half the cost of similar American labor) or upon his cheaper materials. As a result many of the greatest and best known foreign factories are either practically closed down or are operating under such conditions of decreased production, or variegated production, that they are losing money every day.

Reports of new loans negotiated and of impending failures are tabletalk in Paris—the hub of the continental industry.

The Tariff on American Imports.

The necessity behind the present attack upon our customs tariff is as clear as day to anyone familiar with this situation. Our present tariff protects the automobile as well as other similar industries of the United States, from the unfair competition of European labor, whose recompense is based upon conditions of life such as no American workman would tolerate and which, God willing, may never be forced upon him by a removal of ample tariff protection.

Even our present tariff rate would not be sufficient, were American business and manufacturing methods possible abroad. The machine tools of the United States are conceded to be easily the finest in the world—but all advantage in this respect is lost through the almost complete equipment of every foreign factory with the very latest of this product of American brains.

In England, where little or no protection is afforded by tariff, and where the conditions of living, the self-respect and intelligence of the labor element more nearly approximate the similar conditions in America, it has been fully realized that if the motor car industry is to survive, there must be enacted at once just such protective measures against continental overproduction and price cutting as now exist in the United States.

It is inconceivable how there can be any sentiment among American manufacturers, who, in worse than utter ignorance of the situation, can come forward with the proposition that our protection is unnecessarily high. Only a relatively few automobile makers import even a small part of their materials from Europe; and this material is not brought in because it can be done cheaply; therefore the further proposition to increase the tariff rate upon motor car materials would seem to impose a hardship upon the trade without any appreciable benefit to either the labor interests of the country or the revenue of the government.

FOR ANTI-SHOCK DEVICES IN WHEELS.

PARIS, Jan. 16.—Inventors who are desirous of putting the pneumatic tire out of business will have an opportunity of proving their worth in a public competition to be held from Paris to Nice and return next April. For the fourth year in succession the 1,400 miles from Paris to Nice and return will be covered by automobiles having their wheels equipped with various anti-shock devices other than pneumatic tires. A minimum weight is imposed for each class, beginning with one-lungers of 3 9-10 inches bore and ending with six-cylinder cars of 4-inch bore, while a minimum rate of speed will be fixed for each category. The stages will be Paris, Dijon, Lyons, Marseilles, Nice, where an exhibition will be held, and return by the same road. On arrival at Paris a critical examination will he made of the wheels, awards being made according to the condition in which they are found. Only one set of wheels can be carried; no work may be done on them without penalization, and every stop or failure to make controls on schedule time will cause a penalization to be applied.

AFFECTS AMERICAN FOREIGN CAR OWNERS.

The United States Circuit Court of Appeals has handed down a decision which will compel American owners of foreign touring cars returning to this country to pay duty upon their machines. They will be assessed at the same rate as other imported automobiles, that is, 45 per cent.

The court's decision reverses the judgment of the lower courts and the action of the General Appraisers. It was rendered in the case involving the importation of an automobile by W. R. Grace & Company, which had been repaired abroad. The practice has been to admit the automobiles of returning tourists free of duty as household effects.

The court held that the judgment of the lower court that only the repaired part should pay duty was an error, and added that the automobile could only be considered an entirety. The decision held that an automobile is not a household effect in the meaning of the law. That this ruling will have a marked effect upon the attitude of the autoist in his gyrations abroad is assured, and it will stall fraud.

FRANCE WILL HAVE VOITURETTE RACE IN JUNE

PARIS, Jan. 16.—Though there will be no Grand Prix. and consequently no club race for voiturettes this year, small one-lungers will not be altogether without a speed contest during the coming season. Some time in June *L'Auto* will put on foot its fifth annual voiturette race under rules that differ in one important particular from those of previous years. Formerly bore for a single-cylinder car has been limited to 3.9 inches, with stroke entirely unfettered. The natural result was that the stroke has increased in enormous proportions, makers who commenced with a piston stroke of 4 inches four years ago having since run up to 5, 6 and 7 inches, and last year reached the exceedingly long stroke of 9 4-5 inches for a bore of 3 9-10 inches.

The unlimited stroke clause was intended to prove that stroke is not a negligible quantity in the development of power by an internal combustion motor. This has been so clearly demonstrated by all the big European races having been won by long stroke engines that nobody could now be found to maintain that two single-cylinder motors, one of 3.9 by 3.9 bore and stroke and another of 3.9 by 9.8 bore and stroke were of equal power. It is on this account that engines of a larger bore than 3.9 inches will be admitted on condition that the stroke of the piston does not exceed a fixed limit. For a 3.9-inch bore the maximum stroke is 9.8 inches; for 4.3 inches bore the maximum stroke is 6 3-5 inches bore; for the maximum bore of 4 7-10 inches the stroke is also 4 7-10. For two-cylinder engines the same rule holds good, a bore of 3 1-10 inches allowing a stroke of 7 1-2 inches; a bore of 3 7-10 inches allows a stroke not exceeding this.

For four-cylinder engines the lowest bore provided for is 2 1-2 inches, with a stroke not to exceed 5 1-2 inches; the bore may be increased to 2 9-10 inches, with a reduction of the stroke to the same figures.

In this year's race will be lined up cars of various bore with stroke in proportion, the long stroke engine always being encouraged. The Gobron type of motor, with two pistons per cylinder and two-stroke engines will be admitted on an equal footing. The aim of the rules is to prevent the development of the freak designs which were bound to make their appearance with attempts to still further increase the proportion of stroke to bore. Dismountable rims and dismountable wheels are allowed in the race.

It is intended to hold the speed test within sixty miles of Paris, on a varied type of course not more than 25 miles round. If more than 60 entries are obtained elimination races will be held.

BRITAIN'S FIGURES ARE MOST INTERESTING.

LONDON, Jan. 7.—With the assistance of the various licensing authorities, the R. A. C. has completed a census of the motor vehicles registered in the United Kingdom up to October 1 last. The grand total amounts to no less than 154,391, of which Scotland is responsible for 10,907 and Ireland for 6,139. The total for the corresponding date in 1905 was 74,038, so that the number of motors in use has been doubled in three years.

It is interesting to note how the present year's total is made up. Cars for private use number 71,381, while motor vehicles for trade purposes amount to 12,104. Motor 'buses and similar public conveyances reach a total of 5,880 and the remainder of 65,026 consists of motorcycles.

The number of registrations in London amounts to 34,908—only two thousand less than the estimated total for the whole of France. Birmingham ranks as the second city on the list with 3,651 vehicles registered and Manchester follows with 3,021.

SOME NEWS THAT WAS MADE IN GERMANY.

Nearly all the employees of the German factories are making a dead stand against the motor liability law, mass meetings having been called all over the country and resolutions set up. The men fear entire loss of work, as many factories are not only working shorter hours, but with fewer hands already to keep down expenses.

A 15-horsepower Mercedes will be put upon the market early next Spring; this item of news is received in Germany with satisfaction by many who were hitherto unable to purchase one of the bigger vehicles turned out at Untertuerkheim.

At the meeting of the German Motor Car Industrials a new formula for the Prince Henry tour was worked out which will permit vehicles of from 7 to 28 horsepower to compete. Nothing definite has been made known, although the debate on the subject lasted for a good many hours. Last year's rules were far from satisfactory and caused much dissent.

WILBUR WRIGHT LOCATES AT BASE OF PYRENEES

PARIS, Jan. 16.—At a dinner uniting the members of the Aero Club of the Sarthe and the Aviation Commission, Wilbur Wright has bid farewell to the town of Le Mans and in a few days will be installed near Pau, at the base of the Pyrenees. Before the rails were torn up and the wooden shed which has housed pilot and machine for so long was torn down a number of the engineers and mechanics of the Leon Bollee factory were invited to come for a flight. The machine was then dismounted, packed up and shipped by rail to the southwest corner of France. While waiting for his brother Orville and his sister, who are expected here in a few days, Wilbur Wright is spending a little time in Paris attending to private business.

As soon as his brother and sister have arrived the party will journey down to Pau and take up their quarters on the west plains five miles out of the town. A dwelling, consisting of five living-rooms, a workshop and sheds for several aeroplanes, has already been erected, and it is here that all future work will be done. The situation is an ideal one, the town of Pau being sufficiently near to supply all requisites, yet far enough away to insure quietness; for thirty miles to the north stretch the vast Landes, without a tree, a house, or a patch of cultivated land.

The first month at Pau will be spent in training the three pupils, Comte de Lambert, Captain Girardville and Paul Tissandier, with probably the addition of Leon Delagrange. At the end of the time Wilbur Wright will return to America, in order to fulfill his engagements with the United States Army Department. During his absence his brother Orville will supervise the construction of the six aeroplanes which must be constructed according to the Lazare Weiller contract. The spruce for these has been sent over from the States and in general features they will be similar to the one used at Le Manus. A Wright type of engine, built by Barriquand & Marre, of Paris, will be fitted, differing only from the one used last year in a few details. Another engine for the Wright aeroplane has been studied at the Leon Bollee factory at Le Mans.

On returning from America in the Spring, Wilbur and Orville Wright will commence further experimental work on their aeroplane, the nature of which has not been divulged. It is understood that an attempt will be made to very considerably improve what is at present the most remarkable machine in the world.

RULES GOVERNING SIXTH ANNUAL A. A. A. RELIABILITY TOUR

THE rules for the 1909 Glidden tour, published for the first time herewith, embody a number of changes from those in force last year, and it is believed that they will be found generally satisfactory to all concerned. The toy tonneau or double rumble car is now officially recognized as an individual class, and a separate trophy is offered for this class. All cars are classified according to price, in five groups, and the running time allowed is regulated to correspond with the presumed ability of each group.

The penalizations have been made much more strict than before. All spare parts, whether or not they are listed before the start, will be charged for, although those listed will entail a smaller penalty than those made necessary by unforeseen emergencies. Listing is extended even to the tools to be used. Penalties will also be exacted for the time spent by driver and mechanician in repairs, except on tires, which as before cannot be the cause of any downfall. Last but not least, the system of club teams has been abolished. This will no doubt be a cause of satisfaction to the entrants.

Entries will close at noon June 16, 1909; each entry must be accompanied by the specified fee of $200 for those received before May 15 and $300 for all others. Entries should be sent to Frank B. Hower, chairman of the A. A. A. Contest Board, at his office at 760 Main street, Buffalo, N. Y.

TOUR OF 1909.

The Sixth Annual Reliability Touring Contest of the American Automobile Association will be held..... to.....1909, starting at..... and ending at.....

In connection therewith will be offered for competition certain trophies and certificates, described as follows:

1. For touring cars, the Charles J. Glidden trophy. (For details see deed of gift.)
2. For miniature tonneau and double-rumble cars the..... .....
3. For touring runabouts, the Frank B. Hower trophy.
4. For all cars completing the run as contestants, certificates.

Trophy Awards.

1. The trophy in each class shall be awerded to the entrant whose car completes the contest with the least points to its debit. A certificate will be awarded to each contestant who finishes the run under the rules.

Qualifications.

1. Each entrant shall be a member of a club affiliated with the American Automobile Association.
2. Any stock car consisting of a combination of the manufacturers standard touring car chassis, touring body and standard equipment, with seats for four people or more, and carrying four or more persons or ballast at the rate of 125 pounds per person, may compete for the Glidden trophy.
3. Any regular stock chassis with body equipped for two persons on the front seat and with standard equipment, and carrying not less than two persons, may compete for the Hower trophy. The car may have a rumble seat for one or two persons and additional passengers may be carried.
4. Any stock car, consisting of a combination of a miniature tonneau with doors, mounted upon the chassis regularly furnished with same and standard equipment, carrying four persons or ballast at the rate of 125 pounds per person, may compete for the..... trophy.
5. Cars shall at all times during the tour carry mufflers and mudguards, and be fully equipped as per manufacturer's catalogue specifications, except that tops and wind shields need not be carried.
6. Shock absorbers and spring wrappings may be added before the start as equipment, though not regularly furnished.

Responsibility of Entrants.

1. Each entrant by his signature to the entry blank shall agree that he is familiar with the rules, that he will abide thereby and accept the official records, and authorize the American Automobile Association to publish them in such manner as it shall determine.
2. Each entrant shall hold the American Automobile Association harmless and indemnify it against all loss or damage resulting directly or indirectly from or growing out of the operation, management, or control of the car entered by him.
3. The American Automobile Association shall not be responsible for any damage that may be done to any car, its passengers or contents during the tour, nor for the theft of any car or any of its accessories or contents, the same being at all times subsequent to such entry, and until the close of the tour, at the risk in all respects of persons entering same.
4. Each entrant or his official representative shall be responsible for the acts of passengers in his car.
5. Each competing car must be delivered into the custody of the committee before 9 o'clock on the morning of ....., 1909, for official examination and to check the inventories of parts and tools hereinafter provided for.
6. Each entrant shall name an official representative for each of his entries, on or before July 1, 1909, failing which the driver of the car shall be considered the official representative.
7. The official representative of the entrant shall be subject to all rules and penalties prescribed for the entrant, and shall be considered as the entrant in fact.

Entries.

1. The time for receiving entries shall expire on June 16, 1909, at 12 o'clock noon at the office of Frank B. Hower, Chairman, Contest Board, at 760 Main street, Buffalo, N. Y. Each entry must be accompanied by the entrance fee. For entries received prior to May 15 the fee shall be $200; after May 15 and until 12 o'clock noon on June 16 the entrance fee shall be $300.
2. Each entrant shall give all details asked for in the entry blank and such additional information as the Contest Committee may from time to time require.
3. The Contest Committee of the American Automobile Association reserves the right to refuse any entry.
4. Entries shall be numbered in the order of their receipt.

The Route and Schedule.

1. This information will be supplied later.

Pacemaker.

Each day's tour will be preceded by a pacemaker's car; and any entrant or representative thereof who passes the pacemaker shall be disqualified. If the pacemaker's car breaks down or is compelled to travel at a rate of speed so slow as to impede the progress of the tour, his flag shall be transferred to the first car overtaking him, which car shall thereafter become pacemaker's car subject to the same conditions.

Class Schedule.

Competing cars shall be divided into classes as follows:
Class A.—Cars listed at $3,751 and upwards.
Class B.—Cars listed at $2,451 to $3,750 inclusive.
Class C.—Cars listed at $1,751 to $2,450 inclusive.
Class D.—Cars listed at $1,000 to $1,750 inclusive.
Class E.—Cars listed at $999 and under.

1. The Class A running time for each day shall be posted on the bulletin board at headquarters the previous evening. Each driver, using this as a basis, shall figure his own running time and when due at controls.

When the daily running time shall be 9 hours or more the running time of
Class B will exceed that of Class A 20 minutes.
Class C will exceed that of Class A 40 minutes.

Class D will exceed that of Class A 60 minutes.
Class E will exceed that of Class A 80 minutes.
When the daily running time shall be greater than 7½ hours and less than 9 hours the running time of
Class B will exceed that of Class A 15 minutes.
Class C will exceed that of Class A 30 minutes.
Class D will exceed that of Class A 45 minutes.
Class E will exceed that of Class A 50 minutes.
When the daily running time shall be 7½ hours or less the running time of
Class B will exceed that of Class A 10 minutes.
Class C will exceed that of Class A 20 minutes.
Class D will exceed that of Class A 30 minutes.
Class E will exceed that of Class A 40 minutes.

Tools, Parts, Replacements and Repairs.

1. Each entrant shall furnish prior to the start an inventory of all parts carried in his car, and these shall be officially checked, sealed and record made of same, and charged for when used. Each entrant must furnish the manufacturer's price of each part carried.
2. All tools carried shall be listed by the entrant and officially checked prior to the start. Tools include wrenches, hammers, screw-drivers, etc., and not the small accessories frequently included in tool kits, such as emery, wire, solder, etc., which are parts or material and must be sealed.
3. Esch entrant may carry as many tires, rims and tire chains and the parts which secure them in place as desired.

Tire Repairs.

There shall be no penalty for tire repairs, provided the engine be kept running while the repairs are made and no other work done. The time consumed in making tire repairs while the engine is running shall be added to the day's running time.

Controls.

1. Each contestant shall be ready to check out at 7 o'clock each morning. Checkers shall be at their stations at that time prepared to start the cars.
2. Each entrant, or official representative of such entrant, upon starting each day's run, shall sign a statement submitted by an official of the tour fixing the time of his departure, and shall be given a card, indicating such time. Failure to comply shall result in disqualification.
3. The Committee may establish such checking points as it may deem proper.
4. A car ahead of time at night controls may immediately check in.
5. There shall be established at the close of each day's run a parking station, in which all competing cars shall be stored. The station shall be in charge of the Chief Observer.
6. Each car shall be checked on arrival at the control.
7. Following the registration at each night control, each car shall be delivered into the custody of the officials of the tour to be by them held at owner's risk, and kept under direct charge and supervision of such officials or their agents until the time for starting on the following morning, but after registering, the car may deliver the occupants (other than the driver and observer) and baggage at hotel and then immediately proceed to the parking station.
8. Passengers and baggage may be taken on at the parking station after the car has been delivered over to the observer ano driver before checking out in the morning, or at the hotel after checking out, but no time shall be allowed.

Intermediate Checking Stations.

Checking station will be inaugurated in so far as it is necessary to stop racing. Each driver shall receive a card when checking out in the morning which shall name checking stations, so that he can estimate his running time during the entire day. There shall be no appeal from the time registered by the various official watches.

Observers.

1. Each entrant shall furnish at his own expense one official observer for each car entered by him; all observers shall be acceptable to the committee and subject to its instructions. If the entrant is an automobile manufacturer or dealer, or in any way connected with the manufacture or sale of automobiles, each observer furnished by him shall be
(a) A person who has been regularly and exclusively employed by the entrant by whom he is nominated for a period of not less than three months immediately prior to the contest, or
(b) The entrant himself or an officer or director of his business, or
(c) A dealer in the car made by the entrant;
(d) An owner of a car made by the entrant.
2. If the entrant is not an automobile manufacturer or dealer, the observer furnished by him shall be satisfactory to the Committee.
3. Each observer msy be assigned to a different car each day.
4. The Committee shall be empowered to suspend any observer who neglects, is incompetent, or for any other reason fails to fulfil the duties assigned to him, and to provide a suitable substitute at the expense of the entrant, by whom suspended observer was nominated.
5. It shall be the duty of each observer under all conditions and without evasion of this rule for any reason whatsoever, to remain with the car until he has been relieved by the chief observer and to report every detail of the performance of the car to which he is assigned, and all persons who operate, repair, assist or perform any action connected therewith.
6. Observers must not advise drivers as to the rules, but in case of a tire repair when the engine is running he shall sign and hand to the driver a printed form on which is filled in the time used and see that the time is added to the running time.
7. After the car is parked the observer shall present his record for inspection to the driver of the car on which he has ridden and obtain the driver's signature thereto. The record shall then be immediately delivered to the chief observer; the driver, the observer and other occupants of the car shall leave the parking station only when released by the chief observer.
8. In the event of sickness or an accident to an observer which shall make it an impossibility for him to remain with the car, or secure a substitute properly authorized, he shall select one of the passengers of the car as a substitute observer, who shall perform all of the duties pertaining to the position and shall, in addition thereto, have his record signed by all the occupants of the car during the time he is on duty.
9. Should any objection be made by the driver to the record, a report may be made immediately to the Chairman, who, in the event of a dispute as to facts, may require the driver to state his objections in writing. The record may also be inspected by one other properly authorized representative of the entrant, who shall also have a right to register an objection and submit proof in support thereof.
10. The observer shall ride in the seat assigned him by the entrant or driver.
11. When any work, whether under penalty or non-penalty conditions, is being done on different parts of the car, making it impossible for the observer to properly watch each operation, the observer may compel one of the workmen to stop until such time as he can properly watch him.

Penalties.

1. All cars start with clean score.
2. Penalties shall be imposed for:
(a) Late arrival at night control.
(b) Repairs and replacements.
(c) Deterioration as shown by final examination under published schedule.
3. After an allowance of two minutes, each late arrival will be penalized one point for each minute or part thereof.
4. Parts, labor and use of tools shall be penalized as follows:
Inventoried parts and material carried from the start: One-tenth of a point for esch ten cents (10c.) or fraction thereof.
Time consumed by driver and mechanician in work in connection with such parts: One-tenth of a point for each man working for each minute or fraction thereof.
Outside labor: Two-tenths of a point for each man working for each minute or fraction thereof.
Parts and material not inventoried and carried from the start: Two-tenths of a point for each ten cents (10c.) or fraction thereof.
Time consumed in connection with such uninventoried parts: Two-tenths of a point for each minute or fraction thereof for each person.
For the use by driver or mechanician of tools not listed: Two-tenths of a point for each man for each minute or fraction thereof that such tools are in use.
5. When a number of parts are used at the same time, each part shall be separately penalized. Example: If a bolt and nut are used together, each will be recorded and penalized as a separate part.
6. Any car which may, for any reason, discontinue as a contestant, shall be penalized 1,000 points in addition to all previous penalizations.
7. In recording time to be penalized, the operator of the car and the observer must mutually agree as to the time when work commences, which shall be immediately recorded on observer's card, and as to the time when such work ceases, which shall also be immediately recorded.

Road Regulations.

1. Entrants and official representatives of entrants shall conform to all laws, ordinances and rules of the road, and any entrant or official representative of such entrant violating any of the provisions of these rules, or of other rules adopted by the Committee, or who shall fail to show due consideration to the officials or other participants in the tour or other users of the highways, may be disqualified.
2. Any car whose owner or driver shall be arrested for a violation of speed laws, or of any law or ordinance, may be disqualified.
3. When road conditions are so bad that a car cannot get sufficient traction to move, or is ditched, and reasonable effort has been made to extricate it, towing or other external means may be used to relieve the immediate distress only, but under no circumstances shall a car enter a night or any other control except under its own power. When towing, or assistance from any external source shall have been received by a car, its observer shall make a full and complete report, giving time, place, conditions, distance of tow, and any other details.
4. Each car shall have its official number prominently displayed on each side of the hood, and, if possible, painted on radiator.
5. No record of any previous performance, or sign, or special indication of the maker's name, other than a nameplate on the front of the radiator, shall be displayed on any car at any time during the tour.
6. All replacements, replenishments, adjustments, or repairs can be done only on the daily running time.
7. The tools listed may be used by the operator and by the mechanician without penalty, but must be done on running time.

Protests; Disqualification.

1. A written protest may be filed with the Committee, by any participant in the tour, but must be accomponied by the sum of $25. If the protest is not sustained this sum will be retained by the American Automobile Association, but if the protest is sustained, the protest fee will be returned to the person making such deposit. No protest except conforming to the above requirements will be considered. Each protest will be acted upon at the earliest practicable moment.
(a) Any protests as to unfair rulings, routes, etc., shall be made within twelve hours after the occurrence.
(b) Any other protests shall be made during or immediately after the tour is concluded, and before any award is made.
2. No entrant, or his official representative, shall be disqualized until he shall have been notified of the act complained of, and if the act be denied, he shall be given a hearing, after which a decision shall be rendered. Upon notice of such disqualification he shall cease to run in the contest, the official numbers shall be removed from his car, and such entrant shall not receive any certificate, but shall be mentioned in the records as having been disqualified, and no entrant of any car that may be disqualified shall have any claim of any kind or nature whatsoever against the American Automobile Association of any member or members of any committee or any official of the tour, because of such disqualification, or the publication thereof, or failure to mention the performance of the disqualified car prior to its disqualification.
3. Contestants who withdraw may, in the discretion of the committee, continue on the tour as "non-contestants."

Powers of the Committee of the Contest Board.

1. The Committee of the Contest Board shall manage the tour, with full power to enforce the rules, render decisions and do anything else that would be within the province of the Contest Board of the American Automobile Association.

PROPOSES A NEW KIND OF COUNTRY ROAD

WASHINGTON, Jan. 19.—A new kind of country road—a combination of asphalt and macadam—was proposed to the Independent Asphalt Association at its annual meeting, in the New Willard Hotel, to-day. The innovation was suggested by Amzi L. Barber, who has spent most of his life in the asphalt business. A macadam highway, with a strip of asphalt in the middle, he said, was the hope of the future, the only highway to stand the heavier loads and the ever increasing automobile traffic. The idea bears the stamp of novelty, and the speaker's argument was well presented. In the course of his address Mr. Barber quoted Government statistics to show how large a proportion of the country's wealth was produced by farmers, and what a small share of the Government appropriations, comparatively, was devoted to their interests. Largely on account of the unimproved state of the roads, he said, the mere hauling to markets and to shipping points costs the farmers of the country $662,000,000 every year.

This is a Typical Stretch of Country Road in Michigan.

The speaker reviewed the progress of the good-roads movement in recent years, and advocated extensive Government aid.

"It is only a question of time," he said, "until such appropriations will be made. They are as necessary for good roads as for rivers and harbors, or for post-offices. The farmer has the same right to demand quick delivery, which is possible only over a good road, that the city man has to demand fast mail trains and frequent delivery by city carriers."

An Asphalt-Macadam Highway.

In approaching the problem of road construction, Mr. Barber sketched the advances made since John Loudon Macadam, a century ago, devised the kind of road which still bears his name. The macadam road, admirable as it is, has been found unable to stand against the wear and tear incident to modern vehicles, modern loads and modern speed. Mr. Barber said in part:

"Inasmuch as macadam and asphalt, by long evolution, the first for one hundred years, and the last for nearly forty years, have established themselves in many countries as the premier types of roads, I have, after long and careful consideration, come to the conclusion that the best, if not the only solution of our problem, is a combination of the two in the form of an asphalt strip of suitable width, running through, and usually in the middle of the macadam.

"Horses can be driven on the macadam as now, if desired. Automobiles, when the road is clear, will have an ideal surface in the middle, equal to a billiard table, with no ruts or lumps to look out for. When automobiles meet, they will slow down and turn out so as to run upon the macadam only on one side and for a few feet; and when rain first falls on the asphalt, making it slippery, they can run with one side on the pavement and one side on the macadam, to avoid skidding. When on the strip of pavement in the middle they will cause neither dust nor wear.

"Finally, and if no other advantage were to be gained, farmers can haul on the asphalt more than double the load that they can haul on macadam. This consideration alone should decide the matter in favor of the asphalt strip."

Mr. Barber spoke of the damage caused to the smooth surface of roads by automobiles and of the increasing seriousness of this damage.

"It is well known," he said, "that automobiles, even at moderate speed, tear up macadam and grind its fragments into dust, thus destroying the road and causing a nuisance to all who use it, and to occupants of houses on the roadside. It is equally well known that automobiles do not destroy asphalt pavement nor cause any dust from it, no matter how great the speed may be.

The Automobile an Important Factor.

"Ten years ago the manufacture of automobiles in this country was practically *nil*. During the year 1907, according to excellent authority, there were produced 52,000 motor cars, with a value of $105,000,000; and about the same output has taken place in 1908. For the year 1909 it is estimated that the manufacture of motor cars in the United States will reach 75,000, with a value of $150,000,000.

"From these figures it seems safe to predict that the motor cars have come to stay. The farmers themselves, who bitterly opposed them at first, are now owning automobiles, and find them to be their most valuable acquisition.

"Statistics in former years show that farmers' wives provided a greater percentage of insanity than any other class. The introduction of the telephone and the rural free delivery have in some measure tended to remove the essential isolation and monotony which were considered the chief cause of the insanity. Automobiles and good roads will furnish complete remedies for these two handicaps to farm life.

"There are in the United States 225,000 miles of railroads, and 2,151,570 miles of public roads, only about 8 per cent. of the latter being improved. For every mile of railroad there are about nine miles of dirt and one mile of good stone road.

An Unanswerable Good Roads Argument.

"The total expenditures of the United States for the ten years ending in 1906 amounted to $6,309,742,632. Of this vast amount only about three-fourths of 1 per cent., namely, $47,000,817, was directly devoted to the interest of agriculture and yet the prosperity of the whole country depends primarily upon the condition of the agricultural interests. Manufacturing, transportation, trade and banking all are directly related to and dependent upon the crops which the farmers raise and haul to shipping points on rail or river. Every citizen of, and every person in, the United States is a consumer of farm products, and is directly benefited by cutting down the cost of hauling those products from the farms to the shipping points.

"Now, if Uncle Sam would appropriate, say, $20,000,000 yearly for ten years for the building of good roads, and would apportion this among the States and Territories according to population, on condition that the States accepting should provide three times as much, the benefit to the whole people of the United States would be immediate and of enormous value. The States would eagerly accept their allotment, and could provide the three-fourths of the money required by contributing one-fourth themselves, and apportioning the two-fourths thus obtained among the counties, with the provision that the counties supply the remaining two-fourths. Then each county could itself contribute one-fourth and apportion the three-fourths among the townships, on condition that the townships accepting the apportionment provide the remaining one-fourth. This arrangement means that for every dollar provided by the United States each State, each county, and each township would provide another dollar. Under such an arrangement the building of good roads throughout all the United States would proceed by leaps and bounds."

Taking the average cost of making a sixteen-foot macadam roadway as $10,000 per mile, Mr. Barber estimated the total cost of a sixteen-foot road with a six-foot strip of asphalt in the middle at about $13,000 a mile, an increase of 30 per cent.

"This asphalt strip," he said, "should last for from fifteen to twenty years, or longer. It will successfully overcome the old difficulties and avoid causing any new ones."

For the actual construction of the new kind of road, he proposed a portable plant for mixing and laying the asphalt. This plant, carried either on one four-wheel vehicle, or in separate parts on separate vehicles, would be self-propelling. The ingredients would be delivered alongside the plants in wagons, or along road at proper distances, for use as the machine was driven forward. The proposed plant would have its mixer in the rear, so that the hot mixture would fall directly upon the spot where it was to be laid. This method, as compared with the stationary plants employed in cities, would save the cost of hauling the mixture from the plant to the place where the work was in progress. The elimination of cost in hauling the mixture would be of vast importance.

PART OF AUTOIST IN NATIONAL CONSERVATION MOVEMENT

THE American automobilist has probably never regarded himself as a part of the great national conservation movement which has now taken root and which is being pushed by some of the ablest minds in the country.

Powell Evans, of Philadelphia, who is chairman of a delegation recently appointed by the American Automobile Association to confer with the National Conservation Commission, in a recent interview gives some idea of the duty which falls upon every member of the national automobile association in order to carry out to an ultimate and successful conclusion the building, maintenance, and mapping of a great chain of highways reaching in all directions over the United States.

Mr. Evans, who is also chairman of the A. A. A. Touring Information Board, believes that through the connection of the association with the National Conservation Commission the twenty thousand odd members will now be in a position to accomplish more in the direction of good roads than they have ever been able to do through any previous good roads organization.

Much Can Be Now Accomplished.

While a great deal has been done by automobile clubs scattered throughout the country, the effort has been more or less disjointed, and it is now believed that through the influences of the Conservation Commission all which has been done in the several States can be brought together, maintaned and improved for the good of the whole country and for all users of every kind of vehicle.

"The formation of automobile users into clubs," says Mr. Evans, "has finally developed into a definite policy, which comprehends the broad question of good highways, well built, maintained and carefully posted and mapped. This policy also embraces the decent use of highways, not only by automobiles, but by all travelers, together with just and equitable legislation for every class of highway users. This programme is being advanced with activity, honesty and intelligence. The National Conservation Commission recognized this fact when it invited the A. A. A. to become one of its conferrees.

"The Conservation Commission fully appreciates the fact that one of its greatest duties is the encouragement of a complete system of national highways. A good road conserves energy, time and money. It seems to be the consensus of opinion that States should themselves construct and maintain the great highways within their limit, and that the lesser division of the State should construct the smaller highways. This is the general trend of advanced good road legislation from the legislative standpoint.

One Law for All Road Users.

"As regards road use, the association believes that travel on main highways should be regulated by one law for all users, and that if lights on vehicles are necessary they should be used on horse-drawn vehicles as well as on automobiles. It is now pretty generally recognized that some allowance must be made for the destruction of road surface by rapidly moving vehicles. If the caulks in the feet of horses or the chains on motor car tires destroy portions of the roadbed this should be borne as a necessary evil and charged to highway maintenance.

"It is further believed by every man who has given serious thought to this highway problem that the rules governing the use of public thoroughfares should properly come under the Interstate Commerce and not be subject to change at the whim of some unreasonable local legislator or town board. The association stands for broad and uniform road laws covering all travelers alike. It denounces recklessness, and urges the punishment of all inconsiderate drivers, and it invites all users of self-propelled vehicles to join in this good work.

"The important principles underlying all good roads work are known but not sufficiently adopted. It is the purpose of the association to make all these facts known to those in authority, thus conducting an educational campaign."

This is a Stretch of the Famous Old Jericho Turnpike on Long Island.

CLUBS PREPARE FOR WORK OF NEW YEAR

NEW YORK STATE'S LEGISLATIVE SITUATION.

ALBANY, N. Y., Jan. 18.—While motor vehicle legislation has been given an impetus thus early in the session of 1909 by the Governor's recommendation in his message, there is nothing exceptionally significant in the bills which have been introduced so far. The State Automobile Association bill, which was considered and amended in several particulars without changing the general plan and scope of the measure at the end of the regular session of 1908, has been reintroduced in the Senate by Senator Allds, of Chenango, and in the Assembly by Assemblyman Hamm, of Wayne. The principle of the proposed increased tax or license fees for autos is a tax on weight, and began with a registration fee of $5 for a motor vehicle of 1,500 pounds weight or less; $10 for one weighing over 1,500 pounds and not more than 2,500; and for every 500 pounds in excess of 2,500 pounds an additional $5. This question of a weight tax will have to be fought out again, as there are members of the Legislature who own two or more cars who insist that such a scheme produces an excessive tax on the individual and all out of proportion to the damage the motor vehicles do to highways in comparison to other vehicles which use the highways without paying any tax save where they may by chance be assessed as personal property. It is likely to be some time before the legislators get seriously to work figuring out just what sort of a motor vehicle increase tax bill they will frame.

The other motor vehicle bill so far introduced is not a new one, having been introduced and not pressed to final passage in either house by Senator Grady, of New York, in one form or another for the past three years. Senator Grady says his bill is aimed only at the reckless driver or operator, and proposes a rigorous penalty for any autoist who endangers life or limb of others on the highway. Nor is it wholly restricted to motor cars in its application as it covers all kinds of conveyances driven or ridden over the highways.

SYRACUSE HAS AN EFFECTIVE CLUB.

SYRACUSE, N. Y., Jan. 18.—The Automobile Club of Syracuse had its annual meeting at the Yates, with 75 members in attendance. In the absence of President H. W. Smith, First Vice-President Howard P. Denison presided. Both he and Mr. Smith were re-elected to their positions, as were also Dr. C. M. Ryan, second vice-president, and Forman Wilkinson, secretary and treasurer.

The constitution was changed to provide for the serving with the officers of a board of directors, and the following men were chosen to act for the first year: Alexander T. Brown, D. E. Watson, J. William Smith, C. C. Bradley, Jr., and Willett F. Brown. The president, one of the vice-presidents and four of the directors will in future comprise a necessary quorum for the transaction of business. This will avoid the annoyance in the past of frequent meetings being called with no resultant necessary quorum, for heretofore the club has had no directors.

The report of Treasurer Wilkinson showed the club to be in excellent financial condition. The receipts during the past year were $1,583 and the expenses $1,263, leaving a balance on hand of $319.

There was considerable outlay the past year for road signs. About $200 went to the State Association to be used in connection with the fund for fighting inimical legislation at Albany.

The total membership of the club the first of this month was 217, 205 being residents and an even dozen being from out of town. Sixty-eight new members were taken in during the year. A determined effort is to be made to make the membership 300 or over before the end of the present year. President Smith will later appoint a route sign committee, as well as committees on exhibitions, contests, races and tours, law and order, and roads.

MINNEAPOLIS CLUB WANTS TO BUILD HILL.

MINNEAPOLIS, MINN., Jan. 18.—Again the question of building a scientifically-constructed hill with absolutely correct grade is engaging the attention of the members of the Minneapolis Automobile Club. The idea was broached last Summer and a subscription list was at once started among club members, and now again the subject is up for consideration. It is planned to build the hill on the club's property at Bloomington, 18 miles from Minneapolis, along the Minnesota River bottoms. If necessary land will be leased adjoining that of the club, and a hill half a mile in length can be built. It will vary from 8 to 24 per cent grade, and there will be a sharp, hairpin turn, which will take the cars in the opposite direction and bring the finish right in front of the spacious clubhouse. There will be plenty of room under this arrangement for the construction of grandstands and bleachers.

Col. F. M. Joyce, president of the Minnesota State Automobile Association, recently wired Chairman Hower, of the A. A. A. tours committee, regarding the chances of the Glidden tour coming to Minneapolis this Summer. The answer read: "Impossible to say; very uncertain at present, but route will surely be West." This answer means much, as Chairman Hower has said positively that if the tour is in the West this Summer it will include Minneapolis and possibly Duluth. Col. Joyce will go to Milwaukee shortly to confer with the Milwaukee club officials and to co-operate with them in making arrangements for the handling of the "Glidden army."

BALTIMOREANS OBJECT TO PROPOSED LAW.

BALTIMORE, Jan. 18.—At the meeting of the Automobile Club of Maryland the members went on record in opposition to the bill framed by the Automobile Commission of Maryland proposing a special tax on autos to assist in the construction of improved highways throughout the State. Osborne I. Yellott, counsel for the club and who presided in the absence of the president, Dr. H. M. Rowe, explained that the owners now pay a personal tax and if the proposed bill was passed it would put an additional tax of $60 on a $3,000 machine, $80 more on a $4,000 car and higher rates in proportion to the cost.

The club appointed Joel G. Nassauer chairman of a committee to look for a site for a country club within 10 or 12 miles from the city. The members also expressed themselves as favoring the proposed National highway from Washington to Gettysburg, Pa. A resolution to this effect, which was passed at the meeting, will be forwarded to Congress.

The show committee is hustling around in search of a site for the proposed show under the club auspices the latter part of the next month.

NORRISTOWN DEDICATES NEW CLUBHOUSE.

NORRISTOWN, PA., Jan. 18.—The members of the Norristown Automobile Club were fully rewarded for all the trouble and expense of providing a home when they were able to be present with many friends at the formal opening of the new clubhouse. Within a few minutes' run from here, situated on Ridge Pike, it is easily accessible from all parts of Montgomery county and Philadelphia. On the inside the large living room with its wide fireplace is a most noticeable feature. The roast pork dinner was a ravenous success. Among those who responded to ex-Assemblyman John H. Rex, who acted as toastmaster, were: S. Boyer Davis, chairman of the legislative committee of the Pennsylvania Motor Federation; Robert P. Hooper, president of the Federation; President John E. Mountain, of the Norristown club; Assistant District Attorney Charles McAvoy, Justice O. F. Lenhardt, County Treasurer William Higginbothom, Frank Boyer, Dr. J. N. Hunsberger and Prof. A. J. Schissler.

THE MADISON SQUARE GARDEN SHOW.

An automobile show, or any other show, for that matter, which is held in Madison Square Garden has the advantage of occupying what is undoubtedly the best amphitheater in this country, both in location and in architecture; and if the show fails to be a success the management certainly cannot complain of inconvenient accommodations. When to the natural advantages of the building is added a scheme of decoration designed by an artist and executed regardless of expense, success seems almost assured. The present automobile show would attract crowds of sightseers merely as a spectacle; it cannot be denied that many go who have no interest in automobiles whatever. This gives a golden opportunity to the salesmen, and they are by no means slack in taking advantage of it. Even those whose chief interest lies in the automobiles themselves cannot be insensible to the beauty of the setting.

The decorators have wisely avoided over-elaboration; all details are subordinated to the general effect of spaciousness suggested by the ample proportions of the hall. There are no tall signs to break the view; the exhibitors' names are displayed on inconspicuous standards at the corners of their spaces. And, crowning feature of the whole, the entire end of the building is occupied by three enormous mirrors, which seem to double the amphitheater and make it a complete ellipse.

But, of course, the automobiles are the most important part of the show; and they are present in abundance. The makers who exhibit at the Licensed Association show are all old and well-established, most of them pioneers in the industry. For this reason there are few really striking novelties to be seen; all progress is in the line of refinement and perfection of standard designs. Many of the cars shown are indistinguishable, except by the expert, from former models; yet there has been undoubted progress. A few of the makers have attempted to atone for what they perhaps considered the monotony of their mechanical designs by the use of weird and startling color schemes—a reminder of the monstrosities so common five years ago. As a rule, however. body designs show a marked improvement. The toy tonneaus at present so fashionable are shown in great numbers; although small many of them are more comfortable to ride in than the larger bodies. There is a marked tendency toward the use of individual seats in the rear as well as in front. Mudguards are always fully enclosed, and cape tops are universal, except of course on closed bodies; many other details show the increased care that is being taken for the comfort of the passengers.

To those who attend such a show for the first time one of the most surprising features is always the vast number of exhibitors of accessories. That some of these companies which apparently make only the most trivial playthings—electric cigar-lighters, or a new kind of snap terminal, or a special tire patch—should be able to exist and thrive on the crumbs, as it were, of the industry, is one of the most remarkable evidences of the way in which the auto has intertwined itself in our every-day life.

There is little need to elaborate on the prospects for the coming year; the automobile is now a staple article of trade, for which an extensive market is permanently assured. Financial depressions must continue to affect it to some extent, as they do all industries, though the automobile has become in many cases an actual necessity of life. But the financial sky is now clear. Factories are working to their fullest caapcity, yet the agents still call for more cars. Demonstrations are in many cases becoming things of the past. Every indication points to a year more prosperous than any the industry has known before.

* * *

THE IMPORTATION OF AUTOMOBILES.

As an indication of the activity in the automobile industry it is possible to use the figures of the importation of automobiles and parts as a guide, on the ground that the imported cars will bear a relation to the total of the cars actually used. It is not a constant relation to be sure, but it will serve as a first approximation, and it is interesting to note the extent to which automobiles and parts are brought into this country. The following values are for eleven months ending November of the years given, as reported in the advance sheets of the Department of Commerce and Labor.

In 1906, value $3.997.674: 1907, $2,918,783; 1908, $2,343,646.

As an incident it is to note that the value for 1908 is not so far below the previous year as some of the prognosticators would have indicated. There are other evidences of quite the same reliability and just as difficult to connect up. In a word the automobile industry is a thorough-going proposition.

AUTOMOBILE ENGINEERS HAVE SUCCESSFUL MEETING

By CHARLES B. HAYWARD.

WITH a session that opened at 10 A.M. at the Automobile Club of America and wound up with the annual banquet at the Engineers' Club about ten hours later, the Society of Automobile Engineers brought to a close its fourth annual meeting, which lasted for two days and was the most successful and enthusiastic gathering of its members that has ever been held. As was the case on the opening day of the meeting, the first thing on the program was the running of a series of dynamometer tests on the club apparatus. This was in charge of Henry Souther.

The first car to be placed on the drums was a Fiat touring type, and in this case the principal object of the tests was to check the accuracy of the Veeder tachometer with which the car was equipped, by means of the delicate electric recording apparatus of the dynamometer. The car was run at speeds ranging from 5 to 50 miles an hour, and the readings of the tachometer closely checked with those shown by the instruments at points five miles apart at both increasing and diminshing speeds. The result was an unusually favorable showing for accuracy where the tachometer was concerned, its percentage of error, regardless of the speed, being so small as to constitute practically a negligible quantity. Both at the extremes of its range, as well as at intermediate speeds, its readings checked up with those of the dynamometer to an unusually close degree, the indications at five miles an hour revealing a percentage of error requiring three decimal points to express when figured in fractions of a mile per hour, and its variation at the higher speeds was correspondingly small. The test was carried out at the special request of the owner of the car, transmitted through Amasa Trowbridge, factory manager of the Veeder Manufacturing Company, of Hartford, and one of the members of the society.

Big Benz Tries the Dynamometer.

Through the courtesy of Peter Fogarty, a member of the society and American representative of the Benz, the big racing car which finished such a close second in the A. C. A. grand prize race at Savannah this Fall, and which was such a consistent performer in France last Summer, was placed on the drums. In the past it has been customary to speak of cars having been tried out by the dynamometer, but after witnessing the performances of the big Benz it was the consensus of opinion, not only of the engineers who inspected the machine for the first time, but of those who have been familiar with its operations since it has been installed, that the huge racing car tried the mettle of the testing apparatus very severely, and that without reaching anything like its limit. One or two of the engineers present facetiously remarked that "if Mr. Souther let her out any more, there would be a realistic horsepower indication on the big chart where the Benz had gone through it and the wall back of it too." Fortunately, this did not occur, but the great amount of power developed by the big racing car without drawing upon its excess in the slightest provided one of the most impressive demonstrations that the engineers had ever witnessed.

Despite the large number of members present, the fact that the car was encumbered with nothing more above its frame line than the usual scant racing attire of two bucket seats, tank and tire racks, permitted of an excellent view being obtained, and when the big car began to send the power and speed indicators of the instrument well along toward their maximum without being let out, the interest was intense. Mr. Souther sat in one of the seats beside the driver and when the tape showed a mile a minute one of the members considerately handed him a pair of goggles, remarking that they were necessary at that speed. There was more truth than jest in the remark, for the powerful blower employed to keep the temperature of the cooling water in the radiator down to a normal point, not only kicks up a breeze that is the equivalent of a speed of many miles per hour, but it had also begun to pick up oil and water and send it along in a manner that added considerable realism to the scene for those on the car. No attempt at conducting a regular series of tests was made, as this would have consumed too much time, but at a speed of 65 miles per hour, running on the second speed, the car developed a tractive effort of 500 pounds, showing that more than 100 horsepower was being delivered to the rear wheels at that rate of travel.

Sessions in Engineering Building.

Luncheon was served to about sixty-five of the members at the Automobile Club, a number having had to leave earlier, due to the necessity of keeping appointments. Following this an adjournment was taken to the Engineering Societies Building, in Thirty-ninth street, near Fifth avenue, the privileges of the quarters of the American Society of Mechanical Engineers having been extended to the members on behalf of the former by Professor Hutton.

Owing to the absence of the authors, the papers on "The Economics of Weight Reduction," by F. D. Howe, and "An Improved Type of Compression Coupling," by W. S. Noyes, were read by title, and a special request made for contributed discussion to be published in the following issue of the Transactions on these two subjects.

The paper on "Standardizing Motor Bearings," by S. P. Wetherill, Jr., was then read by the author, and resulted in a lively discussion of a number of points regarding this very essential feature of the design of every motor, that was productive of considerable interest. Mr. Wetherill's paper and the suggestion that it contained is largely based upon the recent successful development of die casting under compression, that has been extended to a point where many alloys not formerly regarded as adaptable to this process can be thus successfully handled. Its employment results in a great saving in the cost of bearings, owing to the elimination of all hand work, as well as the necessity of any machining, as the bearings are cast absolutely true to size.

A number of the members present gave their experience with the use of die-cast bearings, prominent among them being John Wilkinson, designer of the Franklin, whose company has been responsible for the development of die-casting to a very large extent, so that bearings made in this manner have always been a feature of the Franklin cars. A number of other members spoke in favor of the suggestion advanced by Mr. Wetherill, and it is more than likely that more will be heard on this subject in the future, as it is a matter that interests the designer and manufacturer of cars on a large scale in a vital point—namely, that of reducing the cost of production.

S. W. Rushmore gave a résumé of the paper of which he was a joint author with Herbert L. Towle, on a type of indicator with a continuously revolving drum, which, as Mr. Rushmore explained, was not invented with the idea in mind of perfecting a power indicator for the automobile engine, but for a specific purpose—that of locating a fault in a three-cylinder stationary engine installed in the Rushmore plant at Plainfield, N. J. The makers of the engine had carried out all their tests on the first cylinder, which was in perfect working order, and accordingly they were confident that their guarantee on the engine had been fulfilled. The other two cylinders were difficult of access, owing to the size and location of the engine, and Mr. Rushmore devised this special type of indicator to ascertain what was taking place in them, in which he was very successful.

As a matter of experiment, the indicator was then applied to a Locomobile car and a large number of cards taken at various speeds, these cards forming part of the paper itself. Owing to the difficulty of synchronizing the instrument with the motor, its

records naturally do not form a reliable index of the power developed, but they do serve to show what is going on in the cylinder to which it is attached, and are consequently of value for locating faults, such as deranged valve and ignition timing, and the simplicity of the apparatus is such that it was the inventor's idea that it could be employed by a repairman or garage attendant, as no great amount of skill was required to attach or use it, and benefit by its records, once the nature of the latter and their indications were known. Considerable discussion followed.

Autogenous Welding Explained by Mr. Cave.

Through the courtesy of the Davis-Bournonville Company, a complete set of autogenous welding appliances was on hand, and were used by Henry Cave to give a demonstration of the process in connection with his paper on this subject. As the paper was long, Mr. Cave simply gave a short résumé of it, and then proceeded with the demonstration, welding a flange on a cylinder and later joining various metals. In the discussion that followed, W. H. Smith, general manager of the John Keim Mills, Inc., of Buffalo, took a prominent part, owing to his not only having been a pioneer investigator of the art but one of its largest practical users for several years past.

Annual Banquet Was Largely Attended.

Jesse M. Smith, president of the American Society of Mechanical Engineers, was the special guest of the evening at the annual banquet, at which seventy-seven members and guests sat down, the largest number that has ever been on hand for one of the yearly gatherings. Some of the others present were: President Henry Hess; past presidents A. L. Riker and Thos. J. Fay; second vice-president B. D. Gray, Treasurer A. H. Whiting, and several of the managers of the society past and present, such as Prof. R. C. Carpenter, of Cornell, H. W. Alden, F. J. Newman and H. M. Swetland. Among the members and guests present were: Dr. George W. Sargent, Henry Souther, Clarence E. Whitney, William Herreshoff, Rollin H. White, John Wilkinson, H. E. Coffin, J. O. Heinze, C. S. Mott, V. J. Mayo, C. E. Davis, E. W. M. Bailey, Elwood Haynes, Henri Chatain, H. J. Edwards, A. J. Doty, J. M. Landsden, Jr., G. E. Franquist, A. H. Raymond, W. B. Hasselkus, J. A. Anglada, Frank Cooke, Lindley D. Hubbell, H. S. Baldwin, L. K. Clarke, Stanley Beach, C. E. Clemens, A. Churchward, F. Moskovics, H. F. Donaldson, A. L. McMurtry, R. M. Petard, Bruce Ford, C. B. Hayward, and a number of others.

President Hess's Souvenir Program Made Hit.

The feature of the dinner was the souvenir program prepared by President Hess. It was an eight-page pamphlet entitled "Feast of the Sponsors of Red Devils, Green Dragons and Blue Flyers, and their spawn of Jersey Justice Jolliers," the cover being ornamented with the emblem of the society. The motto of the dinner was Patrick Henry's prophetic utterance of March 23, 1775, paraphrased for the occasion. "But as for me, give me liberty (A. M. C. M. A.), or give me license (A. L. A. M.)," which was fitting in view of the fact that the most prominent engineers of both organizations have long been members of the society. The only toast permitted was that printed over the translation of menu into "clear chauffese," and expressed the wish, "May your intake be unobstructed, May your exhaust be clear." Despite the "independents" present, full license was given to talk to the right, left, front or rear, but any man who got up to say anything was threatened with an assault of crockery or anything else throwable.

THE AUTOMOBILE CALENDAR

AMERICAN.

Shows and Meetings.

Jan. 27-Feb. 3..Philadelphia, Second Regiment Armory, Eighth Annual Show, Philadelphia Automobile Trade Association.

Feb. 6-13.....Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. S. A. Miles, Manager, 7 East 42d St., New York.

Feb. 15-20.....St. Louis, New Coliseum Building, Third Annual Show, St. Louis Automobile Manufacturers' and Dealers' Association. John J. Behen, Chairman.

Feb. 15-20.....Detroit, Wayne Pavilion, Annual Show, Detroit Automobile Dealers' Association. E. LeRoy Pelletier, Manager.

Feb. 15-20.. Cleveland, First Regiment Armory, Annual Show, Cleveland Automobile Dealers' Company.

Feb. 15-20.....Bangor, Me., Auditorium, Eastern Maine Automobile Show.

Feb. 16-18.....Denver, Colo., Auditorium, First Annual Automobile Show, Denver Motor Club.

Feb. 18-25.....Toronto, St. Lawrence Arena, Third Annual National Automobile, Motor Boat and Sportsmen's Exhibition. Ontario Motor League. R. M. Jaffray, Manager.

Feb. 20-27.....Newark, N. J., Essex Troop Armory, Roseville Avenue. Second Annual Show New Jersey Automobile Trade Association. H. A. Bonnell, Manager.

Feb. 20-27.....Hartford, Conn., Second Annual Show, Hartford Automobile Dealers' Association.

Feb. 24-27.....Omaha, Fourth Annual Automobile Show, Omaha. Automobile Show Association. C. N. Powell, Sec'y.

Mar. 1-6.....Buffalo, Convention Hall, Annual Show, Automobile Club of Buffalo. D. H. Lewis, Secretary.

Mar. 6-13.....Boston, Mechanics Building, Seventh Annual Automobile Show, Boston Automobile Dealers' Association. C. I. Campbell, Manager, 5 Park Square.

Mar. 8-13.....Kansas City, Kansas City Automobile Dealers.' Association Show.

Mar. 11-13.....Milwaukee, Wis., Hippodrome. First Annual Show of Milwaukee Automobile Club.

Mar. 13-20.....Minneapolis, Minn., National Guard Armory, Second Annual Show, Minneapolis Automobile Show Association. F. E. Murphy, Secretary.

Mar. 15-20.....Rochester, N. Y., Convention Hall, Annual Show. Rochester Automobile Dealers' Association. Charles J. Moran, Exhibition Manager.

Mar. 27-Apr. 3..Pittsburg, Duquesne Garden, Automobile Show. Pittsburg Automobile Dealers' Association.

Races, Hill-Climbs, Etc.

Feb. 20-22.....New Orleans, Fair Grounds Track, Mardi Gras Race Meet, New Orleans Automobile Club. Henry George, Secretary.

Mar. 5-12.....Palm Beach, Fla., Lake Worth, Fifth Annual Regatta. Palm Beach Power Boat Association.

Mar. 23-26.....Daytona, Fla., Seventh Annual Florida Beach Races. Florida East Coast Automobile Association. New York Representative, W. J. Morgan, Thoroughfare Building.

FOREIGN.

Shows.

Jan. 30-Feb. 14.Turin, Italy, Palais des Beaux Arts, Automobile Salon.

Mar. 15-31.....Vienna, Austria, Automobile Exposition, Automobile Club of Austria.

Races, Hill-Climbs, Etc.

Mar. 31-Apr. 14.Monaco, Italy, Annual Motor Boat Regatta and Championships.

May 2.....Sicily, Targa Florio, Automobile Club of Italy.

May 26.....Russia, Moscow—St. Petersburg Race.

June 10-18.....Germany, Prince Henry Cup Competition.

June 14-19.....Scotland, Scottish Reliability Trials.

July 1-3.....France, Angers Course, Grand Prix, Automobile Club of France.

July 13-17.....Belgium, Ostend Automobile Race Week.

Sept. 5.....France, Mont Venteoux Hill Climb.

Sept. 11-19.....Italy, Bologne, Fiorio Cup Race, Automobile Club Bologne.

400 AUTOS BURNED IN BOSTON.

BOSTON, Jan. 17.—What is unquestionably the most disastrous automobile fire that has ever happened in this country occurred at dawn this morning, when 400 automobiles were burned in the automobile storage and repair plant located near Park Square. The fire came from the rear of the building, and the exact cause is not clearly established.

The fire also spread to the old train shed of the Park Square Railroad station formerly used as the terminal of the Providence division of the New York, New Haven & Hartford Railroad, and destroyed the bicycle track and a large pavilion used for exhibition purposes. Six horses in one of the buildings were burned. It is said that the total damage was above $800,000.

There were six garages, including several used chiefly for repairs, in the big storage station formerly the railroad freight shed. The principal occupants were the Park Square Auto Company, the Boston Motor Company, the Rambler Motor Company, the Boston Auto Exchange, the Concord Motor Car Company, and the repair shop of the Marmon Company. All the large sightseeing automobiles in the city, numbering upward of a dozen, were burned, while there were between thirty and forty expensive cars of the limousine type in the storage. Out of the automobiles only two were saved.

The insurance rates on the destroyed property were somewhat higher than those in effect on other buildings of like use in the city, and the majority of the owners were only partly insured.

There were about twenty workmen in the building when the fire started, but all managed to get away, although several of them had narrow escapes. The fire was the largest in this city since last Summer. Coming just before dawn, with buildings and trees coated with sleet from last night's storm, the spectacle when the firemen reached the scene was an imposing one.

The hardest fight which the firemen had was to keep the flames from extending into the business blocks on Columbus avenue, and fully one-half the entire available force was centered on that side of the fire area. The rest of the firemen rushed bravely into the great train shed, the roof of which was burning fiercely, and there the flames were fought until they were stopped by the great brick wall at the upper end.

REMY COMPANY RECOVERS QUICK FROM FIRE.

ANDERSON, IND., Jan. 18.—The buildings containing the magnet-making department and the power plant of the Remy Electric Company were completely destroyed by fire last Wednesday morning. The loss amounted to between $3,000 and $4,000, covered by insurance.

On account of the boiler for the heating plant of the entire factory being put out of commission by the fire, the factory was shut down until repairs could be made. The fire occurring in the middle of the busiest season for the company, necessitated the quickest kind of work on the new building and the buildings were rebuilt complete and under roof by Thursday evening, the second day after the fire.

The entire plant is running as usual and deliveries of Remy Magnetos will not be delayed in any way.

PRESIDENT-ELECT TAFT AN ASSURED AUTOIST.

WASHINGTON, D. C., Jan. 16.—For the first time in the history of the country Congress is about to pass a law appropriating money for the purchase and maintenance of two automobiles for the new President of the United States. The urgent deficiency bill reported to the House of Representatives to-day contains an item of $12,000 for the purchase and maintenance of automobiles for the White House. The chairman of the appropriation committee explained that Judge Taft had intimated that he would use automobiles during his occupancy of the White House, and that he might have the machines at the beginning of his administration on March 4 next, the item was included in the urgent deficiency bill. The entire automobile trade of the country will rejoice over this glad news.

DETROIT'S "BIGGEST LITTLE" SHOW.

DETROIT, Jan. 18.—Preparations for the "biggest little" show, to be held in the Wayne Pavilion, February 15-20, under the auspices of the Detroit Auto Dealers' Association, are going forward rapidly. All plans have been perfected, and the manner in which the details are being worked out under the direction of Manager E. Leroy Pelletier gives weight to the statement of the show committee that so far as it goes—and that is a long way—it will be the equal of anything else in the country, not barring the New York shows.

The decorations will be on a more elaborate scale than ever before attempted locally. Sculptor Edward Wagner, who first won recognition in connection with his work at the Pan-American Exposition, has been busy for weeks preparing designs in clay and an army of men are now engaged in reproducing these in staff. The piece de resistance will be a quartet of chauffeur mermen supporting the main bowl of the big fountain that is to occupy the center of the second floor. Each merman wears cap and goggles and his hands, the muscles on the bare arms standing forth boldly, grasp a steering wheel. The upper bowl is supported by racing chauffeurs, while at the entrance to the seats that enclose the fountain will be smiling automobile girls.

The lower floor will be converted into a Venetian garden with 200 canaries hidden among the foliage.

MILWAUKEE WILL HAVE AUTOMOBILE SHOW.

MILWAUKEE, WIS., Jan. 18.—The first show in the history of the automobile industry in Wisconsin will be held at the Hippodrome in Milwaukee, March 11, 12 and 13. The Milwaukee Automobile Club has just announced its plans for the exposition. The officials believe the time is ripe for Milwaukee to have a show, as the industry never experienced so great a growth as during 1908, and 1909 is expected to be even more successful.

The Hippodrome will be used this year, and beginning in 1910 shows will be held annually in the Milwaukee Auditorium, under construction at a cost of $500,000. The Auditorium will not be completed until April 1.

Secretary James T. Drought, of the Milwaukee club, has already commenced active work on arrangements for the show. The Milwaukee Trade Association will give its hearty co-operation, they being closely identified with each other. There are about 35 agencies in Milwaukee and 40 makes represented.

CLEVELAND'S SHOW LOOKED UNCERTAIN.

CLEVELAND, Jan. 19.—For a few days last week the fate of the Cleveland Automobile Show, to be held February 22-27, was in doubt, for the fire wardens, learning through the efforts of an overly enthusiastic press agent that some 20,000 yards of bunting and thousands of incandescent lights were to be used, started an investigation. Since the terrible Collinwood school fire and the catastrophe in a five-and-ten-cent store, the word "fire" is something to be conjured with in this city.

The wardens served notice on the committee that they would have to give proof that there was no danger of fire. As a result, Sterling & Welch were obliged to give a demonstration of the result of their fireproofing. Many yards of bunting were subjected to such tests, and it was then announced that every incandescent light socket had an asbestos collar. The final result was that the committee was given permission to proceed under the supervision of the wardens.

PENNSYLVANIA WANTS UNIFORM AUTO LAW.

HARRISBURG, PA., Jan. 19.—A resolution asking Governor Stuart to invite the Governors of New York, New Jersey, Delaware, Maryland, West Virginia and Ohio to cooperate with Pennsylvania for a convention to enact a uniform automobile law in the States bordering upon Pennsylvania was introduced in the Senate to-day. The resolution, which was referred to committee, authorizes Governor Stuart to appoint five delegates to the convention.

FAIR WINNERS RECEIVE THEIR TROPHIES.

Unfortunately for some of the fair participants in the recent two-day run to the Quaker City and return of the Women's Motoring Club of Philadelphia, there were not enough prizes to go round, and as the decision of the committee regarding the six that were awarded was unanimous, there will doubtless be some heartburnings. Five of the successful contestants had perfect mechanical and time scores under the regulations of the run, while one prize winner had the misfortune to carry a mere man along as a guest and suffered in consequence, when it came to footing up scores.

Mrs. John Ramsey, of Hackensack, N. J., who drove a Maxwell runabout and carried Miss Hermine Jahns as a passenger, was awarded the Benjamin Briscoe trophy for the driver of a Maxwell making the best showing, while Mrs. J. N. Cuneo, of Richmond Hill, L. I., captured the Hugh Chalmers trophy by her spirited driving of the Lancia "Lampo" car. Her sister, Mrs. Harry Cushing, was the only passenger. Mrs. A. W. Seaman, of Brooklyn, who carried next to the largest number of passengers on the run in her Model D, 1906 Franklin, was awarded the Hol-Tan tropby. Beside the driver there were Mrs. D. H. Seaman, Dr. Elizabeth Hatton, Dr. Florence Lee-Jones and Dr. Ellen Lysaght. Mrs. Seaman was one of the champion drivers of the run, for though she only tips the scale at 90 pounds, she cranked the motor and swung five-gallon gasoline cars like a garage helper.

Miss Alice D. Heyes, of Brielle, N. J., captured the cup donated by the Women's Motoring Club by her skilful handling of one of the new Cadillac "Thirties." Her passenger list was the heaviest of the run, comprising Miss S. E. and M. R. Heyes, Miss E. M. Keysby and Mrs. E. S. Brainard. Mrs. Evelyn M. Buckman, driving a 24-30 Renault, was awarded the managers' donated by W. J. Morgan, while the Secretary's cup, given by Alex Schwalbach, was won by Mrs. A. C. Back, of Newark, N. J., who drove a Maxwell runabout and was accompanied by her husband. Mrs. Buckman, who is a tall and athletic Englishwoman, handled her Renault with consummate skill and stood among the first in the run, but her record suffered through the presence of mere man, who did nothing but lend his company to the occasion. Her other passengers were Mrs. Ida Goodel and Miss M. B. Schwalbach.

CONCERNING PLANS OF THE H. S. HOUPT CO.

Editor THE AUTOMOBILE:

There has been some public discussion of the relations of the Harry S. Houpt Company and the E. R. Thomas Motor Company.

In order that there may be no misunderstanding of our position, we beg to announce that the Harry S. Houpt Company expects to continue as the agents of the E. R. Thomas Motor Company for the sale of Thomas cars in this district until the expiration of its present contract on August 1, 1909.

Harry S. Houpt, who is introducing the Herreshoff car, is acting as an individual solely. The Harry S. Houpt Company will continue to handle the Thomas car during the life of its contract with the E. R. Thomas Motor Company. The Harry S. Houpt Company will also continue the management of the garage department until the expiration of the agency contract with the E. R. Thomas Motor Company.

At the expiration of the contract on August 1, the Harry S. Houpt Company expects not only to take over Mr. Houpt's personal interest in the Herreshoff car, but to introduce another new car on the market to be known as the Houpt car.

The Houpt car will be a larger car than the Herreshoff—will be built both as a four-cylinder and a six-cylinder model. Details of its construction will be announced in due course.

HARRY S. HOUPT COMPANY,
E. M. HOUPT, Secretary and Treasurer.

New York City.

Brookland's 1909 Programme.—During 1909 the committee of the B. A. R. C. proposes to hold race meetings on Bank Holidays and other days to be announced later, and have decided to greatly increase the privileges of members. In addition to the regular race meetings, open to all comers, it is intended to hold one or more club contests with ordinary touring cars.

AUTO DOINGS IN CONNECTICUT'S CAPITAL.

HARTFORD, CONN., Jan. 19.—Halsey M. Barrett and Henry W. Nuckols, receivers of the Electric Vehicle Company, have filed their report of business done during the month of December, with the Superior Court. The Selden patent royalties helped somewhat to swell the cash statement. The report shows charges on account and cash sales of $32,895.34 and purchases of $26,283.65. There was collected by the receivers on the Electric Vehicle Company accounts $3,138.38 and on the receivers' own account $36,266.49, while the Selden patent netted $1,311.92 and interest of $782.32 brings the total rceeipts up to $41,499.11. Of the disbursements, $29,518.52 has been for the factory pay roll. The A. L. A. M. received $1,139.40. The cash balance on deposit in the local bank and the Chase National Bank, of New York City, is $141,812. It is said on good authority that a reorganization will be effected very shortly.

Rumor has it that the Adams-Farwell people will occupy the old Pope tube mills if negotiations can be successfully consummated. Representatives of the company have been in this city during the past few days and have endeavored to get capital interested in the Adams-Farwell car.

Albert L. Pope and George A. Yule, receivers of the old Pope Manufacturing Company, have rendered their report covering the business done under the receivership from November 30 to December 23, 1908. It will be remembered that the concern was reorganized the latter part of December, hence the report covers business done up to that time. The balance in bank and cash on hand in the company's office November 30 last was $75,225.49; tbe cash receipts for the period total $152,655.51. The disbursements amount to $142,341.14. Except for minor details the receivership is practically at an end.

The McCue Company, builder of the McCue Hartford cars has erected a two-story brick building, 47 x 212 feet, on Pliny street. The front of the building will be devoted to the office quarters and the remainder for the shop proper. The McCue Company started work on the new building in November and it is nearly completed. At present the company is located on Capitol avenue, wbich quarters have become too crowded for the successful carrying on of the increasing business.

A movement is on foot to make free such ferries as now ply on the Connecticut River where there are no bridges. As autoists have no other means of reaching either shore without an extensive detour, the ferries derive quite a revenue. That at Lyme, at the mouth of the river, did a hustling business all summer. No one will raise the slightest objection to the ferries being made to transport free of charge.

NEW TWO-CYCLE, FRICTION DRIVE CAR.

ST. LOUIS, Jan. 18.—At the opening of the automobile show a new local car manufacturer will make his public début. The concern is now at work on its first two machines, which will be shown at the Coliseum exhibition, February 15-20. The car, to be called the Darby, will embody in its design all that is desired by the popular fancy and will sell at a price commensurate with the rapid advance of the low-priced automobile.

To provide simplicity and low first cost, a two-cycle, two-cylinder motor will be used in connection with friction-drive transmission. This motor, designed by C. T. Darby, will deliver a full 16-horsepower. The Darby will be built only in runabout style, with single and double rumble seat. In appearance it will be distinctly smart and speedy. The 30-inch wheels will be equipped with three-inch tires. Ignition will be well taken care of by the Atwater-Kent Unisparker. Left-hand drive will be provided.

Harvey D. Dunham and Allen Whittemore are officers in the Darby Motor Car Company, for which corporation papers have been filed. Both are well known in St. Louis society and have for a long time been enthusiastic autoists. Mr. Darby, designer, has had a thorough automobile engineering experience; he was recently connected with a well-known maker of light runabouts

Chas. Templeton, West Liberty, Ia., Using Ford in R. F. D. Work.

Crazy Over Racing.—Reports from the far West seem to indicate that the people on the Coast have gone crazy over automobile races, regardless of kind, place held or speed attained. Following closely upon the announcement of the surfacing of the Ascot track at Los Angeles for races, and a series of races held on the first surface, comes the road-record breaking. These were not confined to any particular course, but as soon as anyone made a record, on the plan pursued at the Donegal (Ireland) fairs, when you see a head hit it, someone immediately went out and broke the new record. This has been fostered by the trade in various ways. For instance, the Chanslor & Lyon people of San Francisco have recently offered a cup for the San Francisco-Del Monte round trip record. This will make a trip of about 200 miles and was to be opened on January 1. No sooner had the cup been announced than half a dozen ambitious road drivers announced their intention of going after it.

Stromberg's Successful Show.—After the show is over and the manufacturer begins to count the cost, the query begins to spring up, "Was it worth while?" The answer from the Stromberg Motor Devices Company, of Chicago, is favorable. Its officers say: "As far as we are concerned, the Palace show was a great success. A great many carbureters were sold direct to owners, and a number of manufacturers heretofore using other makes were intensely interested, going into details regarding the manufacture of the Stromberg carburetor and results obtained by its use. A number of demonstrating cars at the show were equipped with the Stromberg carbureter, and although the weather conditions changed most every day, the carbureter gave universal satisfaction."

National Sales Corporation Announcement.—Signed by Emil Grossman, president, the following announcement comes from this concern: "Owing to differences of opinion regarding the policy of handling the Soot-Proof plug and Automatic wind shield business, we have by mutual consent terminated our sales arrangements with C. A. Mezger, Inc. We will shortly notify you of the name of the wind shield and spark plug that we will be responsible for. Our long-established policy of selling high-grade goods at the lowest possible cost, protecting the trade in their legitimate profits, and making prompt shipments, as well as answering all letters courteously, will be continued as in the past."

Annual Meeting Carrico Motor Company.—This Ohio corporation held its annual meeting January 4, at 208-214 Elm street, Cincinnati. The following officers and directors were elected: President, O. E. Walker, president of the Queen City Forging Co.; vice-president and general manager, F. D. Carrico, formerly general manager of the Speed Changing Pulley Co., and designer of Carrico air-cooled engines; secretary, T. P. Walker, of the Queen City Forging Co.; treasurer, Charles S. Ferris; directors, R. K. LeBlond, of the R. K. LeBlond Machine Tool Co.; Edward Raber, of Raber Bros., hardware merchants, and W. H. Kratz. The increase of business is to bring about factory enlargements.

Toledo Dealers Incorporate.—The automobile dealers of Toledo have formed an association and incorporated under the name of the Toledo Automobile Dealers' Association. Some sixteen dealers have joined and three more are expected to do so. The directors will probably include A. A. Atwood, E. A. Kirk, S. C. Fisk, J. G. Swindeman, A. W. Norris and B. G. Gamble. Another meeting is scheduled for the near future, when officers will be chosen and the final details of the association perfected.

Wanted: American Automobile Agency in Germany.—An American consul in Germany reports that the demand for automobiles in his district is steadily growing and conditions are favorable for a large trade in first-class American makes. He furnishes the names of several local merchants, interested in this trade, who would be glad to correspond in regard to an agency for American vehicles. Address No. 2939 Bureau of Manufactures, Washington, D. C.

Rider-Lewis Motor Car Company's New Plant.—At Anderson, Ind., the new plant of this company is progressing rapidly, and it is expected that it will be ready for occupancy in the early Spring. The Rider-Lewis is a light six-cylinder car of 40-45-horsepower, made in three models, and sold for $2,500. The estimated output for the season is placed at 200 cars.

Gramm-Logan Motor Truck.—Attention is called to the fact that the Gramm-Logan truck exhibited at the Palace show is not in any sense of the word a continuation of the old Logan trucks, the company being entirely different and containing but two men formerly identified with the deceased Logan company. In addition, the details of the product are very different, the name of Logan being retained only for old association's sake.

Removal of an Old New York Firm.—John Lucas & Company, New York City, report that they have moved from Maiden Lane, where they have done business for thirty-seven years, to their new building at 521 Washington street, where they will have more room and a plant more modern in every respect.

IN AND ABOUT THE AGENCIES.

Pennsylvania, Philadelphia.—The J. M. Quinby Company, of Newark, N. J., which has been exploiting the Pennsylvania car in New York City and vicinity, has decided to open up a branch in Philadelphia. An interesting feature of the new move is the decision of the Quinby Company to sidestep the supposed-to-be vital advantages of a "gasoline row" location, and the innovation of opening new quarters in the Freeman Building, at the southwest corner of Twelfth and Walnut streets, will be watched with much interest, especially by those who claim that establishments out of the "select circle" of the "row" invariably wither and die. However, the Quinby reputation and the locality—right in the heart of the high-class shopping district and in close juxtaposition to the Quaker City's blue blood residential section—may prove a winning combination. Manager Thornton, of the firm of Thornton & Fuller, which represented several foreign cars in Philadelphia a few years ago, says the new quarters will be ready for a formal opening some time during the present week.

Franklin Agencies.—The following companies will represent the H. H. Franklin Mfg. Co. for 1909: Providence, R. I., Dauer Auto Company; Rutland, Vt., Rutland Machine & Auto Company; Newburgh, N. Y., George Mason; Scranton, Pa., Standard Motor Car Company; Danville, Va., L. Herman; Portsmouth, O., R. S. Pritchard; Peoria, Ill., Peoria Automobile Company; Danville, Ill., Robert Holmes & Bro.; St. Paul, Minn., Western Automobile Company; Salina, Kan., Saline Automobile Company; Portland, Ore., J. A. Hess & Company; Oklahoma City, Okla., Guy E. Blackwelder; Quitman, Ga., T. A. Bryson Auto Company; Montreal, Can., Wilson Automobile Company.

Continental, Los Angeles, Cal.—The Continental Caoutchouc Company, of New York City, has established an agency on the Pacific Coast with Seeley, Van Zandt & Crackel, 938 South Main street, Los Angeles. This firm will distribute Continental tires, demountable rims, and accessories in lower California.

National, New York City.—The Poertner Motor Car Company, 1876 Broadway, has just been appointed distributer for the National line in this vicinity. This firm will handle these cars exclusively and carry a full stock of parts as well.

Pope-Hartford, Philadelphia.—The West-Stillman Company (Robert Maynes, manager), 612 North Broad street, has landed the local agency for the sale of Pope-Hartford cars.

Reo, Philadelphia.—The Reo Motor Company, of Philadelphia, has been organized to take over the representation

Pierce Agency at Newark, N. J.

of that well-known car in the Quaker City, with headquarters at 338 North Broad street. G. L. Derrickson has been appointed manager of the new agency.

Philadelphia Rubber Tire Company will start business on February 10 at 680 North Broad street, under the management of Saul Levy, formerly connected with the G & J tire agency in the Quaker City.

Cadillac, Orlando, Fla.—Nolan & Rixford have opened a Cadillac branch at Orlando, Fla.

PERSONAL TRADE MENTION.

Stewart McDonald, vice-president of the Moon Motor Car Company, of St. Louis, states that prospects for a banner year for the Moon car were never brighter. Orders for cars have come in so rapidly to the Moon factory that Mr. McDonald was unable to attend the Palace Show and incidentally the fourth annual meeting of the Society of Automobile Engineers, to which he was recently elected a member.

E. P. Blake, the Boston agent for the Jackson cars, has resigned from the retail trade in that city to devote his entire time as distributer of Jackson cars in New England. The Boston agency will be in charge of Harry S. Merry, who will move into the new quarters at 24 Tennyson street, this week.

G. L. Wands, former manager of the Boston branch of the Prest-O-Lite Company, has opened an office at 303 Century Building, Denver, Col., where he will act as branch manager of the Safety Device Company and also the Hoosier Mfg. Company.

S. A. Foster has joined the selling force of the Boston branch of Thomas B. Jeffery & Company, makers of the Rambler. Mr. Foster was formerly assistant sales manager of the Corbin Motor Vehicle Corporation, of New Britain, Conn.

Lawrence C. Fuller, formerly of the firm of Thornton & Fuller, who represented the Simplex and other foreign cars in Philadelphia, has been appointed general manager of the Philadelphia Chadwick branch, 254 North Broad street.

George T. Smith.—At a meeting of the board of directors of the Joseph Dixon Crucible Company, Vice-President Smith was elected president to fill the vacancy caused by the death of E. F. C. Young. W. H. Corbin, counsel, was elected vice-president.

R. R. Drake, formerly associated with the Diamond Rubber Company, has assumed charge of adjustments for the Continental Caoutchouc Company. Mr. Drake will be located at the headquarters, 1788-90 Broadway, New York City.

Frank R. Talbot has resigned as assistant treasurer of the Firestone Tire & Rubber Company, of Akron, Ohio, and will move to Los Angeles, Cal., where he contemplates opening an agency for Firestone tires.

Paul P. Rippien has resigned as general manager of the Autolight and Motor Supply Company, of Philadelphia. Manager Janney, who succeeds him, will take charge at once.

OBITUARY.

Edward F. C. Young, president of the Joseph Dixon Crucible Company, died recently at his home in Jersey City. He had been associated with the company for thirty years and was influential in bringing it up to the present flourishing condition. He will be missed by a host of friends and business associates.

RECENT BUSINESS CHANGES.

Lozier Motor Company, New York City.—The announcement is made that the New York sales office of the Lozier company, having outgrown the present quarters at Fifty-fifth street and Broadway, will on February 1 remove to the Fifty-sixth street corner, occupying the five-story building built for and formerly occupied by the Hol-Tan Company.

Banker Bros.' Automobile Company, Pittsburg, has been reorganized. C. M. Miller is president; R. P. McCurdy, former salesmanager, is now vice-president and general manager, succeeding Arthur Banker; and I. G. Davis is secretary. The company will still continue to handle the Pierce Arrow, Chalmers-Detroit, and Stevens-Duryea cars.

W. H. McIntyre Company announces that by permission of the Indiana Secretary of State it has adopted this name in place of the former one, which was the W. H. Kiblinger Company. The shops at Auburn, Ind., as well as the personnel and policy of this well-known builder of high wheel motor vehicles, remain the same.

K-W Ignition Company, Boston.—J. W. Forbes, the Boston representative of this manufacturer of high-grade ignition apparatus, has removed from 220 Congress street to 70 Long Wharf, where the Boston office of the company will be located also.

Reliance Motor Truck Company is now located in its new factory at Owosso, Mich., where all mail should be addressed. This new plant was designed and constructed especially for the manufacture of motor trucks.

RECENT INCORPORATIONS.

Adams Motor Transfer Company, Boston.—Capital stock, $100,000. Will do a general automobile business. Incorporator: W. E. Eldridge, of Dorchester, who is president and treasurer.

The C. & O. Automobile Company, Jefferson City, Mo., capital stock $6,000, and will rent automobiles. Incorporators: C. H. Duffer and E. E. Reuter.

Wonder Motor Car Company, Kansas City, capital $35,000. Incorporators: E. F. Ettwein, L. A. Ettwein and F. N. Short.

Memphis Taxicab Company, Memphis, Tenn., capital stock $25,000, by F. Farnell, R. H. Allen and W. S. Watson.

BUSINESS DIFFICULTIES.

E. T. Barton, who conducted a tire repairing establishment in Hartford, Conn., has filed a petition in bankruptcy. By his submitted schedules his liabilities are placed at $4,159.49 and his assets at $2,367.20.

TIMKEN GETS DETROIT PLANT.

CANTON, O., Jan. 18.—The importance of Detroit as an automobile manufacturing center is being realized more and more each day by the parts or accessory makers. The latest news from this hustling automobile city is to the effect that another immense plant will be added to the already long list. This latest announcement is to the effect that the Timken Roller Bearing Axle Company, of Canton, the well-known manufacturers of ball bearings and axles, has purchased and will soon occupy with a large force the plant of the Standard Sanitary Mfg. Co., on Clark avenue, the whole of which will be devoted exclusively to the manufacture of front and rear automobile axles. The plant occupies about three acres. This plant, devoted exclusively to the manufacture of automobile axles, will probably be the largest plant of its kind in the world.

The plant in Canton will be retained for the manufacture exclusively of Timken roller bearings, the steadily increasing demand for which has made it necessary to have larger manufacturing facilities.

HOW 'TIS DONE IN NORTHWEST.

MINNEAPOLIS, Minn., Jan. 18.—The Pence Automobile Company believes it can say without fear of being disputed that it is the largest automobile establishment in the United States engaged exclusively in the wholesale and retail automobile business. The building it will soon occupy has a frontage of 75 feet by 160 feet deep, eight stories and a basement.

The first or ground floor will be the offices and showrooms; the second floor will be the garage; the third floor stockrooms; fourth and fifth floor storage; sixth floor paint shop; seventh floor metal, woodworking and top departments; eighth floor machine and repair shop. The building will be constructed of reinforced concrete throughout and will have the most modern appliances and conveniences of every kind. The capital stock has just been increased from $25,000 to $250,000.

VOL. XX NEW YORK—THURSDAY, JANUARY 28, 1909—CHICAGO No. 4

THE AUTOMOBILE

GARDEN SHOW SUPPLIED GRATIFYING RESULTS

NOW that the "Ninth Annual National Automobile Show" held in Madison Square Garden is a thing of the past, a résumé of the results it served to accomplish is in order. It goes without saying that it was not alone the largest aggregation of the products of automobile builders and allied manufacturers that the big amphitheater of the Garden has ever housed in its show career, but it also proved to be the most successful event of the kind that has ever been fostered by the Association of Licensed Automobile Manufacturers in every other respect. Take the matter of attendance as a single item, as this is a factor upon which the success of any exhibition is largely dependent. Despite the fact that the entire week was marked by weather conditions that were far from ideal, the number of people who visited the show during the seven days its doors were open was put down as over 116,000 in round numbers—a total that exceeds by a very substantial percentage anything that has been approached in the show history of the Garden in the past.

Society Arrival at the Show.

Nor, as has been the case at previous events of the kind in other years, has this figure been arrived at by estimating the average attendance. Colonel George Pope, chairman of the Show Committee of the A. L. A. M., was in receipt of the figures for every morning, afternoon and evening crowd of each day of the week, and it was not difficult for even the uninitiated to note that the masses which surged up and down the unusually broad aisles and filled every available square foot of space in the balconies and galleries, were far and away greater than any similar event has ever attracted to the interior of the Garden, or any industrial exhibition heretofore contained in its capacious auditorium and galleries.

"Undoubtedly, the weather militated to a certain degree against the attendance," said Colonel Pope, "but it is improbable that any great percentage of those who remained away were either users or prospective purchasers of automobiles. I am certain that every exhibitor will join me in stating that a larger proportion of the week's visitors were people actually interested in the cars displayed than has ever been the case heretofore. No better proof of this could be cited than the great familiarity displayed, not alone with the principles of automobile construction in general, but with many of its finer points, by the average caller who was sufficiently interested to request information from the attendants at the various exhibits, and the number of persons who did so was so great that it was impossible for the numerous salesmen on hand to properly take care of more than a fraction of those who were really seeking enlightenment to aid them in the selection of a machine. Considered as a business proposition, the automobile shows of former years have been held almost entirely for the benefit of the manufacturer and the dealer, but this year the actual user of the car was the predominant factor." This idea was very generally shared.

Demonstrating Cars in Waiting Outside the Garden.

Of an importance even greater than that of the attendance, in its bearing upon the successful outcome of an automobile show, is the amount of business done by the various exhibitors during the week, and in past years it has been customary to swell the figures to a very large extent by adding the totals of many prospective agency contracts that frequently failed to materialize. In this manner the volume of business done was made to appear truly phenomenal. Selling conditions in the automobile field, however, have been brought down to a business basis in the last year or two, where it is no longer necessary to resort to such means to make the sales appear larger than the reality. The actual facts are such that the real figures call for no exaggeration, so that the thousands of dollars worth of cars and accessories that is given as the net result of the week's business may well be regarded as a conservative estimate of what was really transacted. Exact figures are not obtainable; guesswork is left out. But what must have been a huge total affords a striking illustration of the truly vast proportions that the automobile industry has now assumed, while the manner in which it was divided among the different interests assembled in the Garden serves to give some idea of their relative standing. The chief factor in the make-up of this amount was naturally composed of the sales of complete cars, denoting interest unquestioned.

Much of the increase in the volume of business done at the Garden during the week of the show, as compared with previous years, was generally attributed to the fact that buying during the Spring of 1908 was necessarily very light, owing to the conditions then prevailing, while many who were in the market for cars in the Summer or later, deferred their purchases until the advent of the show should provide an opportunity of examining offerings of best known makers under one roof.

SOME GOSSIP OF THE SHOW.

"Are You Afraid to Show What's Under It?"—To put a check on the ubiquitous meddler who insists on lifting the hood of every car he gets near, just to show his friends that he knows all about its mechanism, the Winton Company put small locks on the hoods of all cars in the Winton exhibit. The result was to preserve the finish of the bonnet and forward part of the dash from scratches and the bonnets were not half on and half off as was usually the case where they were meddled with, but some of the over-curious ones jumped to conclusions and asked, "Are you afraid to show what's under it?" before noting that one of the features of the Winton exhibit was a polished chassis, showing all the internals of the car. It was in the center of the booth, and was usually lost to sight in the crowd, so in that respect at least the curious ones were probably excusable.

Waldron Remembered by Packard Dealers.—At the annual dinner tendered by the Packard Motor Car Company to its agents at the Knickerbocker on Wednesday night of show week to Sales Manager S. D. Waldron was presented a silver service by the dealers as an expression of the appreciation of his work in upbuilding the retail sales end of the Packard, as well as of his efforts at the factory. The presentation was made by Clarence Godschalk, of Philadelphia. The dinner tendered to the dealers by the Packard Company is an annual fixture of show week. It was followed by four playlets presented by Miss Stella Mayhew and company. These were specially written for the occasion, and included impersonations of the different Packard dealers present. It would be difficult to furnish a better illustration of the harmony with which every member of the Packard organization works with his confreres, whether in or out of the factory, than this annual gathering.

"Nothing New at the E-M-F."—It was the boast of the attendants at the exhibit of the E-M-F cars during the early part of the week that they had absolutely nothing new to show. There were no noveltics, no revolutionizers, and no world-beaters on the E-M-F car; in brief, it represented nothing but the very best standards of current engineering practise throughout. Then some genius came along and surprised one of the E-M-F salesmen by telling him he had the newest thing in the show. This is the convertible top for a surrey or two-seated runabout, and is something that top makers have been trying to evolve ever since the new three and four-seaters came into vogue.

Coker F. Clarkson, whom everybody knows as the able publicity department head of the A. L. A. M., should be given special mention for the very efficient way in which the special publicity side of the exhibition at the Garden was pulled off. That Mr. Clarkson furnished a vast amount of clear and explicit mechanical material for the press and general publicity purposes is too well understood to require more than the merest mention. The new "Handbook of Gasoline Automobiles" is one of Mr. Clarkson's most recent efforts, in which will be found an illustration and concise specifications of every automobile turned out by members of the A. L. A. M. This is a work of art embodying the greatest utility from the point of view of the prospective purchasers of automobiles.

"Oh, About 180 Degrees or So."—Paul Lacroix, sales manager of the Renault Freres Selling Branch, was accosted at the show by a friend in search of information regarding a two-cylinder taxicab motor, a description of which recently appeared in *Omnia*. "It would appear from this description," said the searcher after information to Mr. Lacroix, "as if the crankpins of this two-cylinder motor were set at 180 degrees. Do you know if that is the case?" "Oh, yes," answeered Mr. Lacroix, "it is somewhere about there; something like that."

"Foolish Question No. 4396."—One of the features of the *Evening Mail* at present is a running series of cartoons depicting the asinine tendency of the average individual to ask if you are going out when he sees you putting on a hat, overcoat and gloves, or if you are going fishing when he notes that you are burdened with piscatorial paraphernalia and are headed for the creek. If the artist responsible for the sketches could have put in a few hours at the exhibit of the Royal Tourist he would doubtless have accumulated a fund of automobile foolish queries that would shortly bring his series into columns of six figures. "Oh, they use the steering post for a horn," is one that became common at the Royal booth. "No, that's the internal expanding brake," pointing to the two big bronze hands studded with cork inserts, "and this is the emergency over on this side," indicating the sprag and its teeth on the brake drum. "Never put on your emergency till you have to and then use it good and plenty," was the sage advice gratutiously added. "My, that's just like a miniature reproduction of the old Packard reverse lever," is another that crops up every time a new one sees the small auxiliary lever intended to bring the sprag into operation, while "What are those lumps on the brake shafts?" has become classic. The new ignition bus bar carrying both magneto and battery terminals is responsible for another lot of its own, and so on *ad lib.*

"Human Nature's Tendency."—The universal tendency of human nature to finger things was very cleverly utilized by the Republic Rubber Company at the show. Close to the rail which separated its booth from the passing public, the Republic people put a partly finished Republic tire. From each of the rubber studs projected a little spear of rubber about two inches long, giving to the tire somewhat the appearance of a cactus plant. Every man who passed that way seemed to have an almost irresistible inclination to catch hold of these little rubber ends and snap them. That moment gave the salesman an opportunity to explain that this is the result of the peculiar way in which the Republic tire is molded, which makes an inseparable union of the rubber with the canvas carcass. Hundreds of people stopped who otherwise would have passed by and a large number of sales resulted.

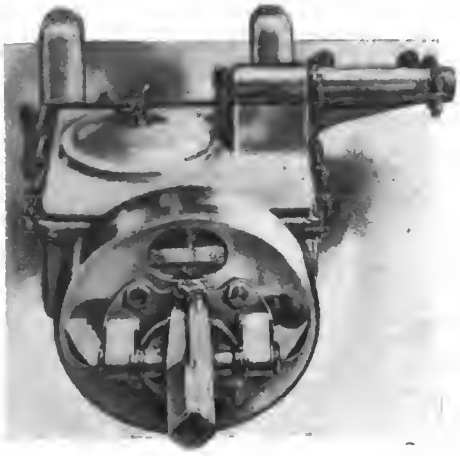
"What Car Is That Going On?"—One of the striking features of the Heinze Electric Company's exhibit was a monster four-unit coil as big as a young trunk. It operates spark plugs a foot high with gaps of fully an inch, and when it is going is sounds like nothing so much as the valve action of an old-time four-cylinder engine that had seen much service. "What car is that going on?" was the query that it was responsible for, while as a corollary there came, "Is that the spark that really takes place in the cylinder?" "Yes, they're in parallel, was one of the bright answers to a query regarding the Heinze analogue showing the crankshaft and pistons of a car, to which was attached one of the new Heinze magnetos and a set of plugs, showing how it could be operated merely by turning a small crank slowly. "Just the thing for a four-cylinder motorcycle," was another anent the overgrown Heinze coil.

"Do You Build the Chassis, Too?"—One of the exhibits on the north side elevated platform of the Garden that attracted quite an amount of attention from the uninitiated observer was that of the Springfield Metal Body Company. A great many of the visitors who were not familiar with automobile construction could not exactly fathom the wherefore of the numerous types of separate bodies that were displayed on low stands, and quite a few of them were not averse to making inquiries to satisfy their curiosity. As a result, the question, "Do you make the chassis, too?" became a standard at the Springfield exhibit, and Hinsdale Smith, president of the company, said that he would be tempted to have a placard painted reading, "No, we don't build the chassis; we build automobile bodies," and post it conspicuously, had not the regulations of the show prevented.

CONSPICUOUS FEATURES ON CARS AT THE GARDEN

By THOMAS J. FAY.

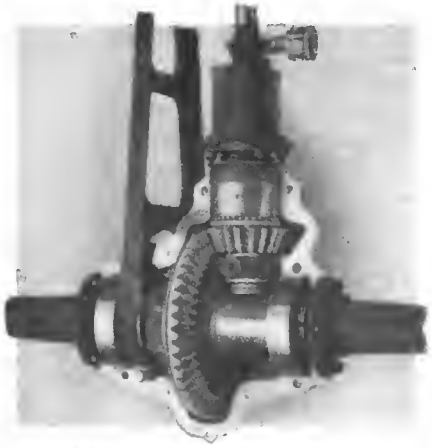
Brake-drum on the Propeller Shaft.—In the Pope-Hartford it is to note that the brake-drum on the propeller shaft is a die pressing of steel, and that the driving member of the universal joint is bolted thereto. It is a very neat arrangement that should be very satisfying to the users of cars. The drum is of adequate diameter, and the face of the brake-shoes is adequate, considering the location and the speed of the drum. A glance at the illustration will disclose the fact that the propeller shaft is fitted into a square, and the whole situation is one that augurs for a low cost of maintenance.



Pope-Hartford Brake Drum on Propeller Shaft, Showing Universal.

Cadillac Oils Universal Joints with a Stream of Oil.—It is a source of regret not to be able to illustrate the manner in which the Cadillac universal joints are lubricated. It is a well understood fact that a universal joint is a common nuisance if it is not oiled, on the ground that dirt will get in if oil is not there to keep it out. In the case of the Cadillac, it is a case of oil, constantly replenished, and there is no chance of dirt to make its way into the joint. Even so, it is a fact that the joints as used in this make of cars are with large bearing surfaces, and the radius at which the pressure is applied is great enough to limit the pressures.

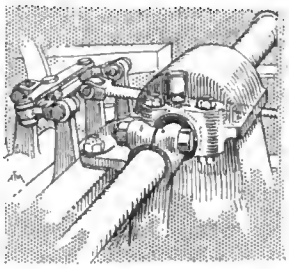
The Royal Radius-Rod Is as a Lattice Girder.—An illustration of the radius-rod on the Royal type of chassis is well worth the attention of the spectators who want to become familiar with the question of the design of automobiles. In this case the radius-rod is as a lattice girder, and, as is well understood, this is a very good way to get all there is in a given weight of steel for a given amount of work to be done. The girder is in the plane of strains in such a way as to work the metal to the greatest advantage, and the extreme fiber strain is held low enough to assure safety.



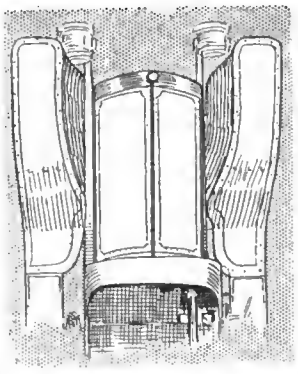
Royal Tourist Rear Axle, Showing Radius Rod.

Planetary Gear of the Hewitt Trucks.—As will be remembered, the Hewitt trucks are very large indeed, intended as they are for the roughest service, and to take all the merchandise that the platforms will hold, piled up as high as the nerve of the truckman will indicate. The planetary gears used are with a view to safety, under severe conditions, and the Hewitt Company indicated how well the planetary gear system answered the purpose by showing a set of gears which had done service for a long time without taking the tool marks out of the gears. The gears are of alloy steel, and the construction is such as to avoid all the ills of keys, and the little details which, in many cases, made planetary gears a source of annoyance. Edward R. Hewitt simply demonstrated that planetary gears can be made to serve the purpose in the hands of unskilled labor, with small chance of damaging either the gears or the power plant.

1909 Mud-guard Construction Is Satisfying.—The idea of completely protecting the chassis from the mud which is bound to splash up and fly off the road wheels is so good that none of the cars of the year have neglected to do something along the same lines. The illustration here given is of the Knox, and while each company had its own way about the details, yet even so it is well to call attention to the plan, and in the Knox the protection afforded is adequate for the purpose.



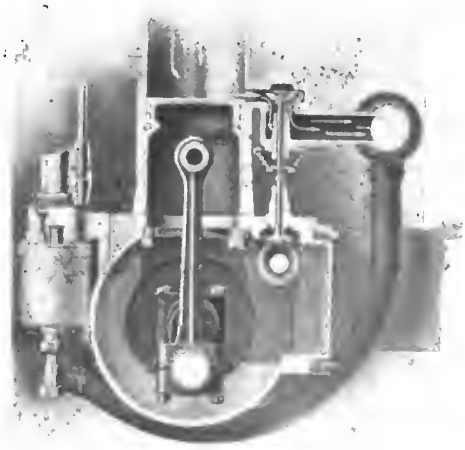
Foot Brake Equalizing Device on Simplex.



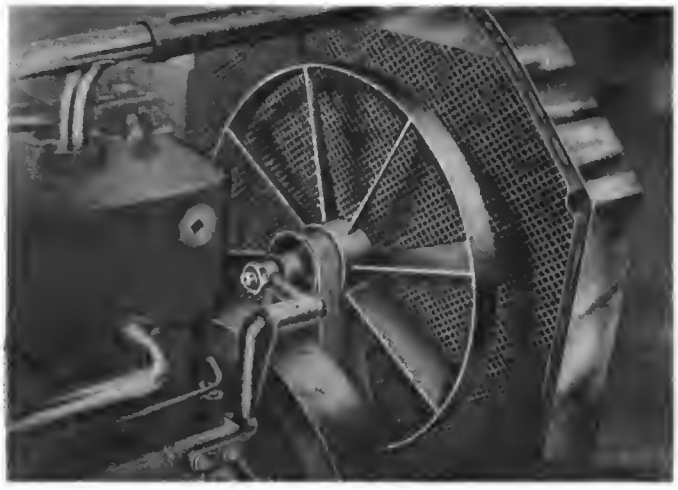
Mud Guard Construction Shown on Knox.

Brake Equalizers on the Simplex.—As is well understood, it is quite out of the question to get any good out of a set of brakes on the rear wheels unless the set of brakes act through an equalizer in such a way as to assure that the pull will come on the brakes on both the rear wheels at the same time, and in such a way as to be equally effective in point of pressure on both wheels. In the Simplex this matter is taken care of in a very good way, and the space required for the device is but little. The idea is adequately illustrated, and the device has been in use so long, and worked so well, that it is now regarded as a standard idea in automobile work.

Supplementary Valve on Franklin Motor.—This is not new, nor is it so well understood as not to be a fair subject for further discussion. The illustration given shows the manner in which the Franklin air-cooled motor is provided with a supplementary exhaust valve at the bottom of the stroke to help scavenge the motor and rid the cylinders of the hot gases at the earliest instant after the work of a useful nature is wrung out as completely as possible from the expanding products of combustion. That the Franklin air-cooled motor has been a uniform success from the start, is one of the certainties of the automobile situation. That it is in a large manner due to Franklin thoroughness must be the case, in view of the fact that the air-cooled situation has not been a bed of roses. As will be observed, the supple-



Franklin Auxiliary Exhaust



Automatic Fan Belt Adjuster on Stevens-Duryea.

mentary valve is mechanically operated, and as a matter of fact it is clearly a case in which the Franklin motors are provided with an exhaust valve at the bottom as well as at the top. The gases only have to travel half the usual distance, and the exhaust is cleared out of the cylinder in the shortest possible time. It is in this way that the cylinders are kept cool, since if the hot gases are not in the cylinder so long, the heat will be less likely to cling to the cylinder walls. It is, in fact, just a plain case of good reasoning, and it works. The added complication is far less than the complication which must follow if the air-cooled motor should fail to work and water-cooling should have to be resorted to.

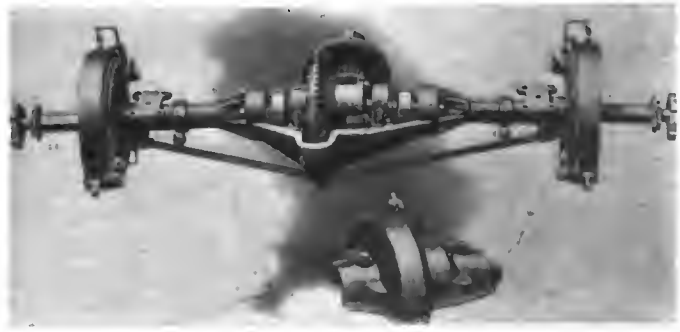
Details of Thomas Six-cylinder Motors.—A look at the illustration will disclose the fact that the fan is on the periphery of the flywheel, which is an idea with a lot of good meat in its makeup. While the illustration is available, it will be at a profit to look at the universal joint and see how it is incorporated; it lies just back of the flywheel. This same illustration shows the foot-pedals and the swivel joints which attach the "pads" to the pedals. These are all refinements characteristic of the Thomas, and in conclusion it is the purpose to call attention to the wide flange on the chassis frame, just back of the flywheel, at the bend. The laterals are also of good dimensions, and on the whole it is evident that the Thomas is a car of some nice details.

Adjustable Fan on the Stevens-Duryea.—There is a great difference as between a fan belt which has to be taken up by the process of cutting some of the belt out, and the manner in which the plan is worked out on a Stevens-Duryea, as it was seen at the Garden. The illustration here given shows the manner in which the belt is adjusted, and as an incident it may be well to call attention to the use of a wide belt on the fan. The fan itself is different from fans in general in that it is of extra diameter and the blades are narrow. It is claimed that this fan will handle more air than the fans of the conventional design; air is what is wanted in this situation.

Fan Outside of Flywheel on Thomas Cars.

Chassis Frame of Selden Automobiles.—It is interesting to note that in the chassis frames of the Selden cars the frame runs out towards the front, maintaining the depth to an unusual degree and without much drop. The result is that the frame is in shape to withstand a good deal of abuse, even to the extent of end impact, due to a collision. The general appearance is good, and it is assured that there is much of utility in the idea. In other respects the frame is quite up to a fitting standard, and it speaks well for the cleverness of the designing staff of the company.

Peerless Live Rear Axle Construction Impresses.—The illustration of a Peerless live rear axle will adequately disclose the principles of design and construction which have stood the company in good stead. As will be observed, the "strut" is of such good dimensions as to assure long service. This is of the greatest importance, in view of the fact that there are examples of live rear axles in which a "strut" of small diameter is placed to do work, the nature of which is so arduous as to defeat the aims of the designers. The bevel gearset in the Peerless is so nicely made as to last quite as long as the car, and this is a matter of the greatest importance. The accessibility of the parts



Construction Details of Peerless Rear Axle.

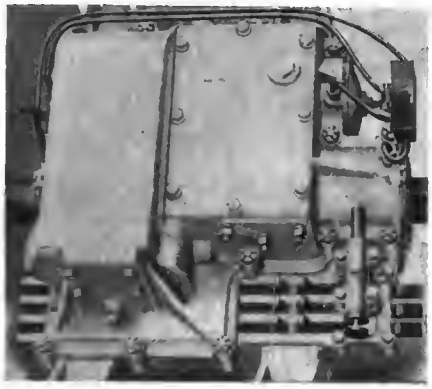
is shown in the illustration, and in other ways the construction is desirable in the extreme.

Separate Provision for Oiling Bearings in Transmissions.—The exterior of a Peerless transmission gearset is shown to bring out the point to be made. As will be understood, it is almost impossible to keep the grease which is placed in the gearbox from seeping into the ball or roller bearings. This grease is ladened with the chippings from the gears, and it is anything but a lubricant. In the case of the Peerless this question is taken care of in a way which must attract the notice of the autoist of experience. Each bearing is fed from an oil pipe, led to it direct, and from the prime source of lubricating oil. The result is that the bearings are not only oiled, but they are kept free from the grease in which the chips from the gears will be found. The reason for this lies in the fact that the oil is always entering the gearbox, and as it enters it drives the grease before it in such a way as to keep the bearings washed. Incidentally, it is fair to assume that the gears will be kept profusely lubricated hy the same oil, and on the whole it should follow that the transmission will be free from undue depreciation.

Low-Tension Ignition System on Locomobile.—In the case of thc Locomobile the company makes the magneto, and the type is of the low-tension genera. The system was devised in 1905, and it is now in a high state of perfection, although it is true that it has been a good success from the start. The illustrations afforded with this discussion will give a good idea of the manner in which the details are worked out, and that the low-tension system is of excellent value, if it is free from mechanical defects, is a self-evident fact. The make-and-break is very simple, as is shown, and the "iridium" contacts used

last for a long time. Because of the nice way in which the mechanical details are worked out, the system is free from the trouble of frequent timing, which was the main question in former times in connection with some of the low-tension systems.

Distance Rods on Shaft-drive Locomobile.—As a rule it is the custom to see shaft-drive cars with radius rods which extend up to the axis of the whole motion as it rotates around the universal joint at the upper end of the propeller shaft. In the new Locomobile distance rods are used just as in side chain drives. The idea makes for great flexibility in the Locomobile, and the car is so thoroughly worked out along lines taking into account the question of flexibility that it is bound to serve as a school of design. A. L. Riker, chief engineer of the company, showed that he could do something by way of originality when he delivered the automobile that came home first in the Vanderbilt race.

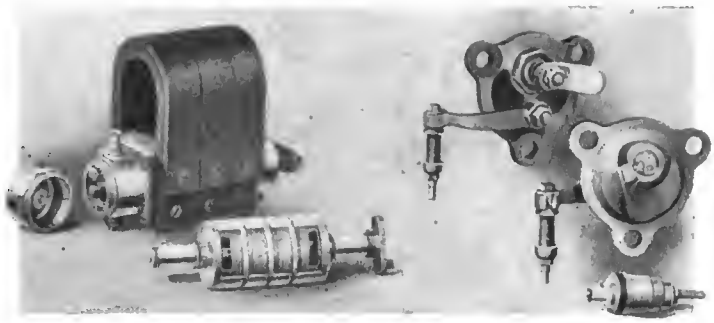


Peerless Separate Oiling System for Gear Box Bearings.

Rear Axle on Stearns New 15-30 Model.—It has been quite some time since the exhibitions of automobiles disclosed anything quite so novel as the new Stearns live rear axle, an illustration of which is here given. In this case, the differential housing is provided with bolting pads which fit on suitable faces on the bow of the axle. The axle itself is of tubular section, from the extremities to a point inside of the spring perches, and as the axle recedes from the perches it is joined by an I-section elliptic formation, the two branches of which are in the same vertical plane. In this fashion the differential and the bevel drive are supported by the axle so formed, without any tendency to put strains on the housing, beyond the torsions due to the torque of the propeller shaft, and the resistance offered by the live rear axle members. The axle is of great strength, and all the shock is taken by the kinetic material of which the axle is made, instead of having to transmit through the castings of the housing. The construction is light, the appearance is a little strange, yet it does look healthy, and the patrons of the industry take kindly to the idea on the ground that what looks good is good. The springs on which the chassis is suspended take the torsion of the axle, and they, in turn, are 2½ inches wide, of alloy steel, hence adequate for the purpose of springs and maintaining axle position.

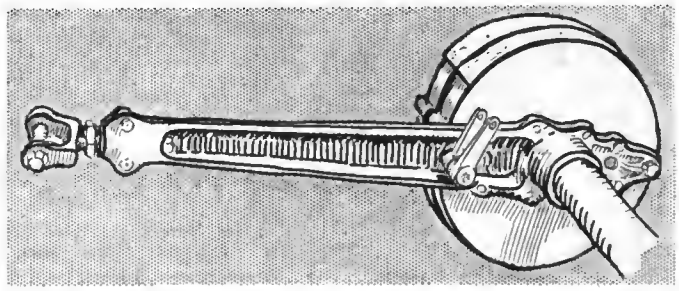
Ball Bearing Worm and Gear Peerless Steering Device.

Oxy-Acetylene Apparatus for Cutting Steel.—In crankshaft work, if the crankshafts are not die-forged, it becomes a serious matter to be able to "slab" the steel and thereafter extract the shape of the crankshaft from the slab. The Davis-Bournonville Company had at the show all the equipment necessary for the purpose, and, too, the question of "autogenous welding" was illustrated sufficiently for the purpose of enabling the average autoist to reach the conclusion that he can have his repairs done by the process in a very efficient manner. This is one of the present year's distinct advances, and it is of such great importance as to merit special mention in connection with the discussion of the advances in automobiles. Certainly it is an advance in automobiles to be able to make repairs in some cases without even taking the parts to be welded out of the nest in which they belong.



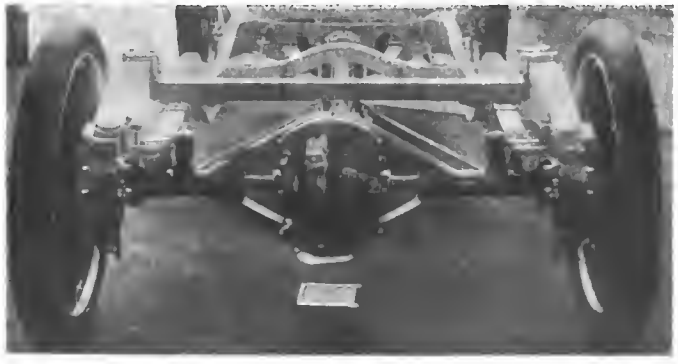
Locomobile Low-Tension Magnetos with Igniters.

Elmore Two-cycle Motor in Modern Chassis.—The motor was illustrated during the show, and favorable comment was made on the good performance of the power plant. While this is a question of the utmost importance, it is a fact, nevertheless, that the plant should be protected, and a glance at the illustration will show that the Elmore designers are alive to the needs. In this case the apron extends back of the gearbox, and the levers, as well as the linkages, are all protected from mud. The equalizer for the brakes is in sight in the illustration, and that the plan is of more than ordinary merit is assured. As will be observed, the power plant rests on a sub-frame, and a straight-line drive is one of the Elmore features. The polished chassis of the Elmore at the Garden was one of the sights of the show.

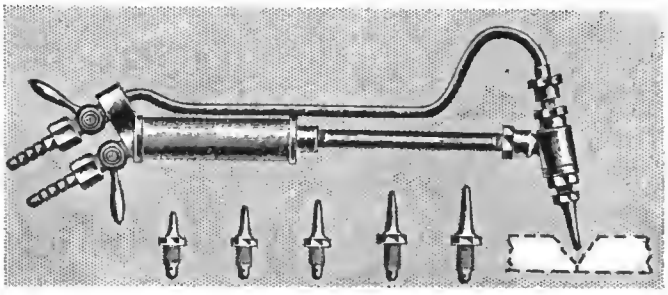


Locomobile Radius Rod Carrying Brake Mechanism.

Influence of Tires on the Cost of Trucking.—The "biscuit" tires on the Hewitt trucks made more of a commotion in



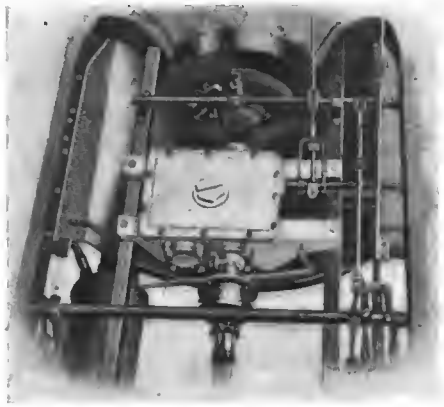
Stearns 15-30 New Rear Axle Construction.



Davis-Bourneville Autogenous Welding Equipment.

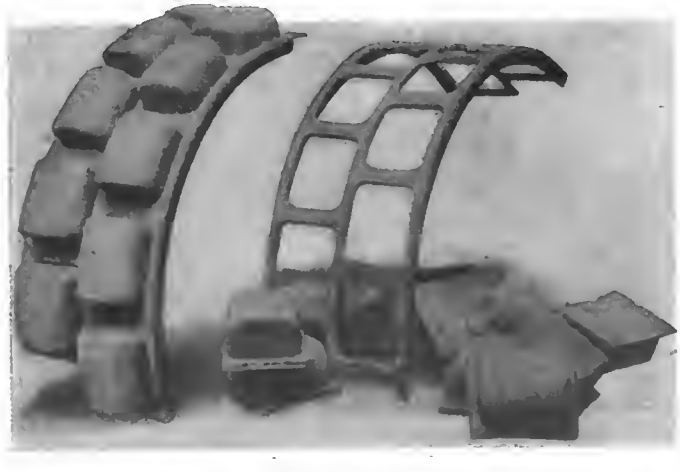
some ways than any other one idea of prominence at the show. In the first place, the trucks are large, and again the wheels do not look quite so large as they would were the tires of the usual solid construction. These "biscuit" or "block" tires are best understood by examining them, and the next best plan will be to look at the illustrations as here given. The blocks are symmetrically disposed around the rim, and are held in place by plates of the desired shape, which allow the projecting blocks to stand out radially, thus enabling the blocks to do the work while the plates hold them in place. The tire question has been a serious matter in trucking service, and it is assured that the block idea is a vast improvement to the service.

Figures, taken from data gathered during five years' operation of a two-ton Hewitt truck, show that the tires are not the one big item in the maintenance by any means. The total cost per year was found to be $2,890, with such items as $500 for depreciation, $900 for labor, and others which together with the $400 for tires completed the annual cost account. This shows that only 13.84 per cent. of the expense was borne by the tires.



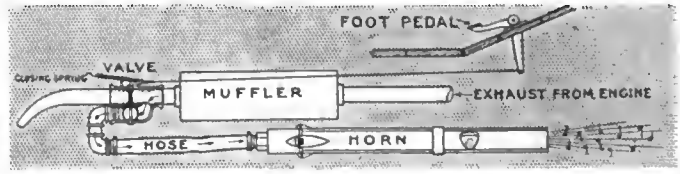
The Elmore Clutch and Gear Box.

Gabriel Exhaust Horns Provided for in Cars. — Formerly it was the custom to design automobiles with never a thought of the accessories, and the means for their proper application. This year, it is not uncommon to locate all the means for the ready application of the accessories, even in the cars that do not include such accessories at the initial selling price. Take, for illustration, Gabriel horns: they work from the exhaust, taking into account the muffler, and in many cases the designers of the automobiles have arranged for the connections of the horns. This is a good idea, even though the cars may be put out without the horns. With all the provisions, it will then be possible for the buyers of the cars to do as they see fit later on, and the cost of the option is as nothing.



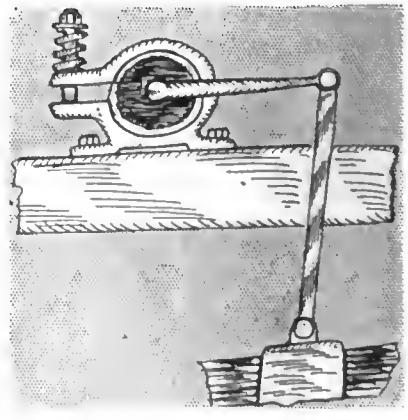
Rim and Treads of Consolidated "Biscuit" Tires.

Perfection Springs.—The Perfection Spring Company showed a line of chassis springs in all the usual forms in which the question of the material is given the greatest possible attention. In the better class of the springs turned out by this company, it is Krupp steel that is used, the properties for which, for the purpose, are vouched for by the large number of the better class of automobiles in which they do service. This Krupp steel is a high silicon product, and as a rule the spring makers who do not understand how to handle such fine materials fail to deliver the good results which follow the use of Perfection springs. At the company's booth was to be seen some of the modern springs as used on the noteworthy cars at the Garden, such as the Stearns line of cars. These springs are 2 1-2 inches wide, of very artistic shape, and the easy riding qualities of the Stearns car speak well for the design and quality of the springs used. In some cases the springs, as shown, indicated the suppleness, which is essential to good service, without the excess "bounce," which generally does follow the adaption of what is best described as a "sloppy" action. In a word, it is a case of limited suppleness, and a gradual snubbing of the body motion.



Plan of Connections of Gabriel Exhaust Horns.

Winton Shock Absorbers Are Self-Sustaining—Among other Winton features is the shock absorber of the company's make. The illustration of this absorber will show that it is a fixed brake-drum secured to the chassis frame (one on each side of the car, over the rear axle), on which drum will be found a brake band and a lever system to take advantage of the friction of the band on the drum. The band is fitted with a take-up, actuated by a spring in such a way as to compensate for wear. The scheme is neat in design, yet even so the fact remains that the adjustment is of a permanent character, so much to be desired in shock-absorbers. Incidentally, it is worthy of of note that the Winton cars are also fitted out with "self-starters," and a tire inflating device. In scanning the Winton exhibition at the Garden, it was to note the high degree of finish and the careful proportioning of the exhaust and mixture manifolds, as well as the water piping system, and since it is generally well understood that the efficiency of an automobile motor is much affected by the dimensions and design of the manifolds and the piping, it is equally easy to understand why the Winton "Six" is a powerful as well as a noiseless performer. It is not difficult to make motors perform quite noiselessly, but it is generally appreciated that the noiselessness is at the expense of power.

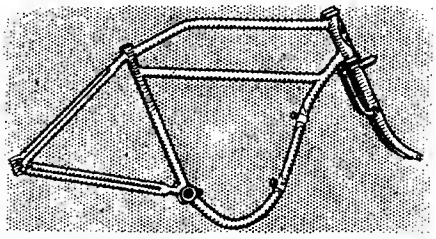


The Winton Shock Absorber.

EASE AND COMFORT BIG MOTORCYCLE FEATURES

THE great, in fact, one might almost say the abnormal, interest manifested in motorcycles in the past year culminated very properly in the excellent exhibit at the Garden show. This was one of the best and probably the most complete exhibitions of this class of vehicles ever seen. Such being the case, it is an easy matter to notice the salient points, or perhaps it would be better to say the general trend. This seems to have taken the way of ease and comfort.

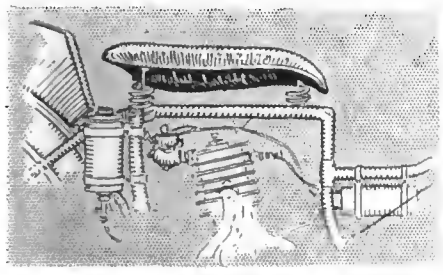
Perhaps these were an outgrowth of the increased attention given to this form of locomotion; possibly the latter was but the effect of the former. In any case, the proof of the statement is a simple matter of mentioning details, regardless of which was the cause and which the effect.



New Loop Frame in Detail.

Prominent among the improvements which make for increased ease and comfort is the new loop frame. This differs radically from the old diamond frame, which was an outgrowth of bicycle construction. It adds strength and great rigidity without adding to the weight, while the easy curve of the lower tube forms a strong natural cradle for the motor. The old diamond frame put the rider in one set position, rather high and far forward, while this newer creation allows of the seat being carried farther back and lower. The effect of this is to lower the center of gravity, thus increasing the stability and making the machine ride easier.

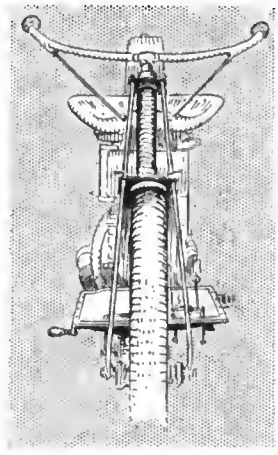
Then there is the matter of seats. Most of these are altered over the former bicycle seats; in fact, so much so that the indications of the old bicycle type are even difficult to find. The width has been greatly increased, and, added to this, the distance between supports or length of the leather has been stretched out. This, coupled with the width, has materially increased the ease of riding. A newer idea, even than this, is the form seat. This is very wide, flat, and comfortable, being correctly formed to the shape of the body. As worked out in the cars it is made from sheet steel, pressed into the correct anatomical shape, upholstered with a large, thick, hair and leather cushion. Over and above the shapes is the springing of the saddles. All of them are spring suspended, the springs being three in number, first the flat spring of the body of the saddle, second the main coil spring of the rear part, and third the small auxiliary or supplementary coil spring at the rear. This combination of well-adapted springs, in combination with the improved shapes, has done more to eliminate saddle soreness or saddle fatigue, as it is variously called, than any other one thing. In so doing the good cause of ease and comfort was advanced apace.



Easy Riding Form Seat.

Another part of the construction to which much time and attention has been given in the attempt to make the roads ride like velvet, is the front fork. This works out in various ways, in the spring fork, in the piston arrangement, and in the link mechanism. The first is the most numerous if mere numbers indicate anything, but most of these, as is natural, differ. There is the barrel arrangement with 2 feet or more of spiral springs inside, which in combination with additional rebound springs works very nicely. The other ways of working this out include an arrangement in which the lower section of the fork is connected with the head section by means of a strong hinge joint suspended between springs. An adjustment on these allows of any desired tension, thus adapting the cushioning effect to the weight of the rider and the quality of the road.

The girder frame is an adaptation of this in that a sort of light, flexible king post truss is used, each lateral member of this being in reality a spring. All these, to cut a long story short, eliminate vibrations of the front end of the machine, and consequently make the natural riding strains on the arms less. There never has been a word or phrase coined to express these strains and the resulting fatigue, but that it exists after a very short ride, any motorcycle advocate will prove.

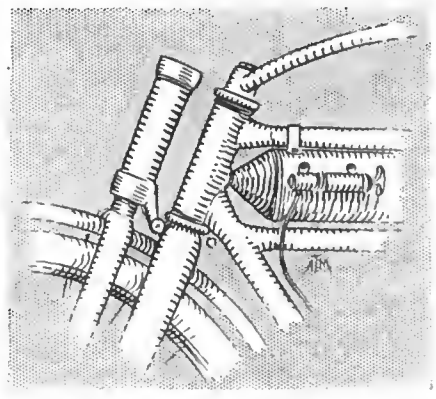


Front View of Foot Rest.

The arms, body, and seat having been properly cared for, there remained only the feet and legs whose comfort had not been looked up. This has worked out in several forms, one of which, the footrest, is very simple. It takes the form of a pair of extra fixed pedals set on a stud forward of the regular pedals about six inches. In use, when a rider's legs tire of the normal position, the feet are lifted from the regular pedals and placed on the extra fixed pedals. Besides the change of position, the latter are so placed as to afford rest to the tired members.

Another and perhaps a better outcropping of the same idea is the fitting of a footboard or running board. This has width and length, so that the whole foot is rested in a manner that is impossible with the narrow pedal accommodating only a portion of the ball of the foot.

Not the least of the comfort-improvements is the use of a transmission. This allows a reducing gear which lowers the speed to a rate that is safe in crowded streets, the usual laborious method of shutting off the engine and pedalling, being dispensed with.



Cushioned Forks Save the Arms.

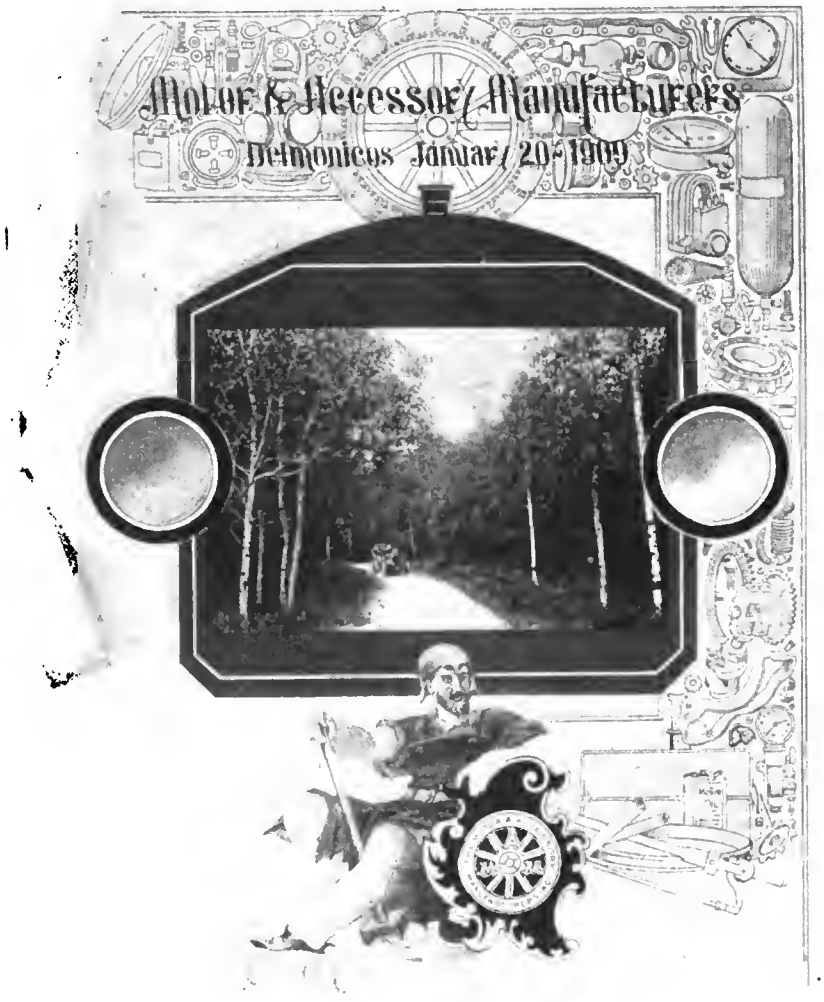
The addition of a luggage carrier over the rear wheel surely makes for increased comfort, the comfort that comes with the knowledge of ever-ready soap, towels, clean linen, and similar items. These are neatly worked out, folded up out of the way when not in use, are of a skeleton construction, weighing very little, so that the advantages of this "extra" far out-balance the disadvantages.

The indications show a considerable expansion of trade in motorcycles for the coming year, which has been foreseen and skilfully promoted by the use of whatever makes for increased comfort, greater ease and improved stability.

First Annual Banquet of the Motor and Accessory Manufacturers Successfully Held at Delmonico's, New York City, Wednesday Evening, January 20, 1909.

WITH a membership of 170 concerns and a comfortable balance of $27,000 in the treasury, the Motor and Accessory Manufacturers are in a most prosperous and promising condition. Its first annual banquet, held on the evening of January 20 at Delmonico's, was a most successful function, well arranged and attended, and carried out to a nicety by the committee in charge. Of course, there will be a similar function next year.

When it is said that Job E. Hedges filled the rôle of toastmaster it will be known that each speaker had a suitable introduction and intermingled were quips of wit and epigrams of scintillating brilliancy of the quality now known as "Jobhedgian."



H. S. White, president of the M. & A. M., contributed a graceful installation of the toastmaster. Ex-Governor N. J. Bachelder, of New Hampshire, Master of the National Grange, made it apparent that the farmers as a whole now recognize that the coming of the automobile is a benefit to all mankind, including he who tills the soil.

Charles Clifton, president of the Association of Licensed Automobile Manufacturers, supplied a businesslike talk that struck home deeply to those present. His remarks elicited applause and comment of general acceptance.

William H. Hotchkiss, president of the American Automobile Association, told of the worth of the national organization of users to the industry as a whole. He referred to the needs of its existence in a national form, and said its place could not be filled by any local club, no matter how large its membership or local influence.

Benjamin Briscoe, chairman of the committee of management of the American Motor Car Manufacturers' Association, took a fall out of the excessive figures current concerning the 1909 output, and found that in reality about 90,000 automobiles would be made for this year's sales. "I make a prediction," said he, "that in ten years horses will be as rare as automobiles were ten years ago." Applause told that his hearers agreed with this belief.

A. G. Batchelder, of the Class Journal Company, spoke on "The Trade Press."

H. E. Raymond, first vice-president, then dwelt upon past, present and future of the Motor and Accessory Manufacturers, naming D. J. Post as the man really responsible for its formation. Mr. Raymond predicted a much greater future and enlarged upon some of the plans for bringing this about.

Preceding the banquet, the annual meeting of the association took place. There were elected for a term of three years to succeed themselves on the board of directors: L. M. Wainwright, Diamond Chain & Manufacturing Company, Indianapolis; F. E. Castle, Atwood-Castle Company, Detroit, Mich.; H. T. Dunn, Fisk Rubber Company, Chicopee Falls, Mass., and E. S. Fretz, Light Manufacturing & Foundry Company, Pottstown, Pa.

At the Waldorf-Astoria, January 21, the board of directors organized for the year with these selections: President, H. E. Raymond, B. F. Goodrich Company, Akron, O.; first vice-president, H. T. Dunn, Fisk Rubber Company, Chicopee Falls, Mass.; second vice-president, F. E. Castle, Atwood-Castle Company, Detroit, Mich.; third vice-president, C. E. Whitney, the Whitney Manufacturing Company, Hartford, Conn.; treasurer, W. S. Gorton, Standard Welding Company, Cleveland; secretary, P. S. Steenstrup, Hyatt Roller Bearing Company, Newark, N. J.

One of the immediate future plans to add to the value of the Motor and Accessory Manufacturers is the segregating of the makers of the various accessories in sub-committees. For instance, the tire makers will pass upon all matters affecting the making and selling of tires as far as such concerns its association membership; the lamp makers will similarly consider questions affecting themselves, and the idea will be followed in the classifying of the entire membership. The advantages in so doing are so plainly apparent that the idea met with instant approval from all concerned. The newly elected president, Mr. Raymond, is known as an organizer, and it is anticipated in advance that the plan will be successfully carried out before many weeks have passed. Results are certain to follow in its wake.

The list of those present at the banquet will be found to contain the majority of those actively engaged in accessory making. In addition to the speakers, the guests of the occasion included Alfred Reeves, general manager, A. M. C. M. A.; S. A. Miles,

general manager, N. A. A. M.; E. P. Chalfant, general manager, A. L. A. M.; M. L. Downs, secretary Show Committee A. L. A. M.; W. M. Sweet, assistant secretary M. & A. M.

The list of members who a tended is as follows:

American Lamp Company—C. M. Hall.
Atwood-Castle Company—I. H. Atwood, F. E. Castle.
A-Z Company—R. S. Woodbridge.
American Ball Bearing Company—F. Philip Dorn.
American & British Manufacturing Company—C. L. Gulick, W. I. Starr.
Brown-Lipe Gear Company—H. W. Chapin, Thomas J. Wetzel, K. Franklin Peterson, L. D. Bolton.
Ajax-Grieb Rubber Company—Wm. C. Grieb, Harry Grieb, Wm. L. Hughson, H. W. Stimpson, H. de Lisser.
Badger Brass Manufacturing Company—R. H. Welles, Louis J. Keck.
Bowser Company, S. F. (Inc.)—S. B. Bechtel, W. T. Hatmaker, D. A. Corey.
Baldwin Chain & Manufacturing Company—Wm. H. Gates, H. V. Greenwood.
Byrne, Kingston & Company—C. T. Byrne.
Coes Wrench Company—G. V. Allen.
Chandler Company (Inc.)—L. J. Chandler.
Continental Rubber Works—T. R. Palmer, Wm. J. Surre, Alex. Jareckl.
Cramp & Sons Ship & Engine Building Company, Wm.—Courtland D. Cramp.
Cowles & Company, C.—Louis C. Cowles.
Continental Caoutchouc Company—J. M. Gilbert, E. E. McMaster.
Consolidated Rubber Tire Company—Van H. Vartmell, F. E. Holcomb.
Connecticut Telephone & Electric Company—E. C. Wilcox.
Columbia Nut & Bolt Company—Fred Atwater.
Cook's Standard Tool Company—Eugene Cook.
Detroit Steel Products Company—Jno. G. Rumney.
Dow Tire Company—A. V. R. Barnewall, Alex. Dow.
R. E. Dietz Company—Richard Everett.
Diamond Rubber Company—W. B. Miller, H. J. Woodard, G. J. Bradley, E. P. Weber, E. H. Fitch, C. E. Mathewson, O. J. Woodward, N. E. Oliver.
Diamond Chain & Manufacturing Company—L. M. Wainwright.
Federal Rubber Company—O. R. Cook, O. S. Tweedy.
Fisk Rubber Company—E. H. Broadwell, B. H. Pratt, H. G. Fisk, J. B. Kavanaugh, H. T. Dunn, A. N. Mayo, W. P. Kearney, J. C. Cole.
Firestone Tire & Rubber Company—H. S. Firestone, R. J. Firestone, F. H. Martin, J. V. Mowe, Jas. Couzens.
G & J Tire Company—B. C. Dowse, H. A. Githens.
Gabriel Horn Manufacturing Company—C. H. Foster, R. M. Brown.
Gemmer Manufacturing Company—Geo. Brandenburg, J. I. Brandenburg.
Goodrich Company, B. F.—H. E. Raymond, F. Y. Stewart, H. C. Miller, J. W. Lyman, H. B. Linwise, W. O. Rutherford, A. J. Wills.
Globe Machine & Stamping Company—A. F. Schroeder.
Goodyear Tire & Rubber Company—Chas. Measure, Wm. T. Teagon, O. L. Measure, E. F. Jackson, A. F. Osterloh, G. M. Stadelman.
Gray & Davis—L. Hollander.
Hartford Rubber Works Company—H. E. Field, J. D. Anderson, M. C. Stokes, E. S. Edwards, W. R. Barnes.
R. E. Hardy Company—R. E. Hardy, C. D. Manley.
Heinze Electric Company—J. H. Heinze.
Ham Manufacturing Company, C. T.—Jas. Barnes, W. A. Graham.
Hodgman Rubber Company—G. B. Hodgman, S. F. Hodgman, A. W. Warren.
Hartford Suspension Company—Arthur Waterman.
Hess-Bright Manufacturing Company—Henry Hess.
Hyatt Roller Bearing Company—C. A. Sloan, P. S. Steenstrup, B. G. Koether, H. A. Brown.
Phineas Jones & Company—Henry P. Jones.
Jones Speedometer Company—W. Lashar, G. L. Holmes.
Lebanon Steel Casting Company—W. E. Farrell, W. H. Worrilow.
Light Manufacturing & Foundry Company—W. I. Grubb, E. R. Cassel, F. S. Brant.
Leather Tire Goods Company—C. B. Woodworth.
Manufacturers' Foundry Company—Fred'k C. Fromme, Edward W. Beach, Chas. M. Clark.
Mosler & Company, A. R.—A. R. Mosler, L. V. Hansen, A. W. Moyer.
Manhattan Screw & Stamping Works—Louis F. Leland, Frederick M. Stevens.
Morgan & Wright—C. J. Butler, A. I. Philp, J. C. Weston.
Motsinger Device Manufacturing Company—P. J. Dasey, H. N. Motsinger.
McCord & Company—P. L. Parter, J. W. Cain.
National Battery Company—E. B. Cottrell.
National Carbon Company—Nelson C. Cotabish.
N. Y. & N. J. Lubricant Company—T. A. Matthews, F. J. Barnes, W. F. Kimball, J. H. Bennis.
New Process Raw Hide Company—T. G. Meachem.
Randall-Faichney Company—W. A. Randall, Frank Harden.
Rands Manufacturing Company—W. C. Rands.
Republic Rubber Company—H. W. Fralt, F. Hill, J. H. Kelly.
Rose Manufacturing Company—H. C. Rosenbluth.
Standard Roller Bearing Company—P. M. Germane, T. J. Heller.
Shelby Steel Tube Company—H. S. White, J. G. Bateman, H. A. Flagg, C. Wharton, Jr., J. J. Dunn, H. O. Ramsey, F. Lyman, J. E. Millen, E. F. Hollinger.
A. O. Smith Company—A. O. Smith.
Sprague Umbrella Company—Col. Sprague.
Standard Welding Company—W. S. Gorton, W. H. Firrong, L. D. Rockwell.
Salisbury Wheel Manufacturing Company—S. H. Penfield.
Strieby & Foote—C. W. Baker, W. C. Nicoll, K. L. Ryman.
Schwarz Wheel Company—L. S. Bowers.
Splitdorf, C. F.—P. J. W. Kelley, G. H. Murphy.
Syracuse Aluminum & Bronze Company—C. L. Ackerson.
Swinehart Clincher Tire & Rubber Company—B. C. Swinehart.
Timken Roller Bearing Axle Company—W. R. Timken, E. W. Lewis.
Veeder Manufacturing Company—D. J. Post, Geo. Collister, W. F. Sagle.
Vacuum Oil Company—F. B. Thurber.
Warner Gear Company—T. W. Warner, R. P. Johnson.
Westchester Appliance Company—Jas. M. Fischer.
Whitney Manufacturing Company—C. E. Whitney, W. W. Totman, W. Hill (of London, England).
Wheeler, F. H.—F. H. Wheeler, E. W. Spencer.

S. D. WALDON ELECTED PRESIDENT N.A.A.M.

At the annual meeting of the National Association of Automobile Manufacturers, which was held at the New York headquarters, 7 East Forty-second street, January 20, the election, which was practically the only thing of moment on the program, resulted in the choice of the following officers for the present year:

S. D. Waldon.

President, S. D. Waldon, Packard; first vice-president, William E. Metzger, E-M-F; second vice-president, L. H. Kittredge, Peerless; third vice-president, C. C. Hildebrand, Stevens-Duryea; secretary, Benjamin Briscoe, Maxwell, and treasurer, William R. Innis, Studebaker.

Thomas Henderson, Winton, the retiring president, was again chosen as one of the members of the executive committee, the result of the election otherwise being to move every one of the officers for the past year up one peg. The retiring members of the directorate were re-elected, so that this body remains the same as before.

It is made up of S. T. Davis, Jr., Locomobile; Windsor T. White, White; Charles Clifton, Pierce; Thomas Henderson, Winton; W. E. Metzger, E-M-F; S. D. Waldon, Packard; W. R. Innis, Studebaker; C. C. Hildebrand, Stevens-Duryea; H. O. Smith, Premier; Albert L. Pope, Pope-Hartford; Benjamin Briscoe, Maxwell; L. H. Kittredge, Peerless; R. D. Chapin, Chalmers-Detroit; W. M. Lewis, Mitchell, and C. G. Stoddard, Stoddard-Dayton.

THE SUCCESSFUL A. M. C. M. A. SHOW.

In view of the enormous attendance and the great number of exhibitors at the Ninth Annual International Automobile Show in the Grand Central Palace during the first week of the year, it did not come as a surprise to those who paid for space there to learn that the Committee of Management of the A. M. C. M. A. had decided to make a rebate of 67 per cent. to all exhibitors—a figure that has never been approached at any previous event of the kind. This was the first year in which the show has been held under the auspices of the American Motor Car Manufacturers' Association. The show committee made its report at a meeting held at the association headquarters, 29 West Forty-second street, New York, January 20. The Importers' Automobile Salon and the Motor and Accessory Manufacturers, Inc., are interested in the division of the profits with the A. M. C. M. A.

To the show committee, consisting of H. O. Smith, chairman, S. H. Mora, R. M. Owen, Benjamin Briscoe, E. R. Hollander, D. J. Post and Alfred Reeves, general manager, was extended a unanimous vote of thanks for their very able management.

A standard form of warranty that will be fair to the buyer and to the manufacturer, the matter of good roads, as well as other routine business, were acted upon. The annual meeting of the association will be held at Chicago, Tuesday, February 9.

In attendance at the meeting were Benjamin Briscoe, chairman, Maxwell-Briscoe Motor Company; James Couzens, Ford Motor Company; C. G. Stoddard, Dayton Motor Car Company; Charles Lewis, Jackson Automobile Company; H. O. Smith, Premier Motor Mfg. Co.; R. E. Olds, Reo Motor Car Company; Walter Marmon, Nordyke & Marmon Company; S. H. Mora, Mora Motor Car Company; W. H. VanDerVoort, Moline Automobile Company; Alfred Reeves, general manager.

CHICAGO'S BIG SHOW WILL BE AN EYE-OPENER

CHICAGO, Jan. 27.—Preparations for the N. A. A. M. show, which will open here a week from Saturday, are being rushed, and are in such shape that the decorators will be at work in the two big buildings, the Coliseum and the First Regiment Armory, by next Monday. This will be the earliest the show people ever have been given the keys to the buildings, and will enable the decorators to finish their work in plenty of time for the exhibitors to get in and have everything in readiness for the opening of the show. This time the slow ones will not be able to blame the decorators.

Anticipating securing the buildings early, Manager Miles and Assistant Fest have pushed along the work of making the decorations, and as a result they now have the papier-maché and stucco embellishments ready. They are stored in warehouses, and there will be no delay in installing them. Those who have had a peep at the decorations predict that the Chicago show will be more beautiful than ever. Collaborating, Manager Miles and Artist Thiede have devised a color scheme in which copper, bronze and old gold will play an important part. Old Mercury will again be "on the job," but he will be dignified this time by being in the center of stained-glass windows in variegated colors instead of staring down, a mass of stucco, from a red or green board as he has done for several years past. Green silk and golden trimmings also will be used.

In the way of signs, the show visitor can locate the different exhibitors easily because the signs themselves will be located on the top of the sections. They will consist of white and gold raised letters on a red silk background, and immediately above will be placed white flower boxes filled to a height of two feet with real ferns and flowers.

Papier-maché has been largely used in the decorative work, although stucco has not been entirely discarded. Manager Miles tried papier-maché for the first time in his last show and he found it preferable because of its comparatively light weight, so he has retained it. As an argument for its use, it is pointed out that two men can handle a piece of papier-maché decoration where it takes ten men to move plaster. This, therefore, will greatly facilitate the installation of the decorations. Two hundred girls have been engaged making these, and in addition fifty painters and half a dozen sculptors have been working under the orders of Assistant Manager Fest.

The Chicago show will have in the neighborhood of 255 exhibitors, smaller, perhaps, than at either of the New York shows, but, on the other hand, the spaces at Chicago are claimed to be much larger than the ones in the East. It wasn't because Miles could not get more exhibitors that the list is confined to 255 names—he simply could not place any more. Even now he has a waiting list a yard long, and it is hinted that one of the reasons he went to New York was to dodge those who came here simply insisting they must be given space.

QUAKERTOWN IS HAVING ITS ANNUAL AUTO SHOW

PHILADELPHIA, Jan. 27.—In a building one-half the required size—its usual handicap—the Philadelphia Automobile Trade Association to-night opened its eighth annual exhibition. Small as is the Second Regiment Armory, it is yet 50 per cent. larger than the most available downtown building, the First Regiment Armory, the scene of most of the association's former shows. Within a few days of the initial announcement, some months ago, the latest available inch of space was bespoken.

While the members of the association—there are 45 of them—were naturally given first choice as regards location, the spaces were laid down of a uniform size, and each concern was allowed but one of them. In that way only could even the "early birds" be accommodated. That the committee has worked to some purpose may be gathered from the fact that by thus limiting the space assignments 50 of the three-score cars represented in Philadelphia found a resting place under the armory roof when the ball dropped to-night. With each annually recurring automobile show there is a howl for a big exhibition building in this "conservative and slow-going" old burg; such a plaint is rising now, from various quarters, and—who knows?—perhaps by this time next year there may be such a building here, and Philadelphia will come to its own as a show center and give the national exhibitions a rub for the honors. Apropos of this, a movement has been started to make such additions to the building in which the show is being held as to double the amount of floor space and provide the city with a much-needed exhibition building before the end of the present year.

At the Philadelphia show the licensed and the unlicensed car lie down together, and the foreigner fraternizes with both. There are no side issues in the way of upstairs, basement or company-room exhibits. Even the accessories and the trade journals are on a level with the big cars. Nobody is compelled to climb up and down but the band. It is one of the most compact and easily getatable shows ever held in this city.

The innovation of a midweek start—necessitated by the fortnight's interval between the New York and Chicago shows—will be watched with interest. The three days intervening between the close of the Garden exhibition and the beginning of the Quaker show permitted of the bringing here of many of the former's exhibits without the usual rush which marked the Saturday or Monday openings of former years. But with the opening of the Windy City affair some of the exhibits which are scheduled for both will have to be handled very quickly in order to reach Chicago by Saturday night.

The cars on exhibition include the Acme, Chalmers Detroit, Columbia, Crawford, Elmore, E-M-F 30, Ford, Fiat, Franklin, Gaeth, Grout, Isotta, Jackson, Knox, Lancia, Locomobile, Lozier, Marmon, Matheson, Maxwell, Middleby, National, Overland, Packard, Palmer Singer, Peerless, Pennsylvania, Pierce-Arrow, Pullman, Rambler, Regal, Detroit, Royal Tourist, Simplex, Speedwell, Stanley, Stearns, Stevens-Duryea, Stoddard-Dayton, Studebaker, Thomas, White Steamer, Winton—just an even half-hundred, included the Carroll carbonic acid gas car, which is on exhibition for the first time.

The latter is expected to arouse a great deal of interest, for it will be a Philadelphia invention, built here by local capital, the Carroll Power Company having secured a factory here and started work. Among the many claims for it, is the ability to run from here to Chicago on a single charge of gasoline costing at retail not over 50 cents.

The apparent dearth of accessories is explained by the inability of the show committee to scare up space. About a score of odd corners here and there were awarded the applicants in the order in which the requests were mailed. A full score of disappointed applicants, including several automobile dealers, were left out in the cold. Partly as a result of this, and partly from choice, several of the "Gasoline Row" concerns are running individual shows, with all the usual musical, decorative and gastronomic side features. Among these are Oldsmobile, Reo, Buick and a few others. Besides these, most of the "Row" concerns, unable with the limited space awarded them by the Armory show management to make a comprehensive exhibit of their cars, are having supplementary shows at their several agencies and branch houses.

DEVELOPMENT OF FOREIGN AND DOMESTIC CARS

By E. T. BIRDSALL, M. E., A. L. A. M.

IN the early days of the automobile industry in the United States little or nothing was known of the properties required in the materials of construction. For example: Aluminum was a novelty, cast iron and bronze were used for the gear wheels of the speed-change mechanism; roller bearings having unhardened rolls operated in soft axle tubes as a bearing for soft-steel solid axles; bronze and malleable iron were used for connecting rods; the hardening and grinding of crankshafts and many other parts were unknown; brakes were lined with wood blocks; any yellow metal for bearings was "bronze," regardless of its composition; hardening meant "case-hardening" sometimes .001 inch deep, sometimes more, but always an indefinite amount. Heat treatment, alloy steels and hardening as we know them to-day were practically unknown in the early days of auto making. Structural steel; bar, plate and rod stock; woods of various kinds; cast iron; brass and bronze of the ordinary "merchant" shapes and qualities were alone available for the automobile builder.

E. T. Birdsall.

Where the Foreign Maker Had Early Advantages.

In Europe, on the other hand, the requirements of foreign gunmakers, engine builders and others had created a demand for special steels and bronzes. From the beginning of the automobile industry in France the machines were entered in races and other competitions that developed in a few hours weaknesses and shortcomings of design in materials that would have taken months of ordinary use.

Finding that increasing the size alone of a weak part to make it strong enough was not always the remedy, or even always feasible, the manufacturers naturally turned to the steel-makers for better materials.

Right here another difference between the United States and Europe should be noted. In the United States the steel-makers wanted "tonnage." That is, they would not get out a special grade of metal and set up the rolls to shape it unless an order for many thousands of tons was placed. Whereas, in Europe the steel mills would take an order for a few hundred pounds of a steel of special composition.

The net result was that the French automobile builders by races that tested the materials and design of construction, by the facility and possibility of procuring proper materials, by cleverness in design and by keen competition, soon distanced all other nations in the production of cars that were reliable, fast and dependable.

How One American Maker Made a Test.

A concrete example of the above is furnished by the actual experience of one of the early American manufacturers who conceived the idea of building in this country an exact copy of a well-known and successful French car. After the first car was built the testing out proved that the American tubing used in the frame had only about one-half the strength and stiffness of the tubing used in the model. The gears would not stand up under the work and the wearing qualities and general durability of the entire machine were far below the French model. A careful investigation showed that the difference was solely due to the quality of the materials used.

As at that time practically no one here who was available knew the difference between the materials in the model and the copy and there were not procurable in this country materials from a constructive and commercial point of view that would answer the purpose, the manufacture of the car was discontinued.

Conditions in the American engineering talent and material market have in the last three or four years completely changed. We now know what material to use in each particular place, how to use it, where to get it and why we use it.

It is, moreover, a fact that the reverse of the above-mentioned case has happened. An American manufacturer in 1899 and 1900 produced a number of 8-horsepower cars with single cylinder, vertical in front engine. The owner of one of these cars appeared within the past two months at a New York salesroom and stated that he still used his little 8-horsepower original American car and that the bearings and all of the parts had stood up wonderfully well. This car must have had excellent material and admirable design. As a matter of fact, one of the largest manufacturers in Germany acquired in 1898 exclusive rights to manufacture this same car of American design and on American specifications for material. All the detailed drawings were converted into the metric system and sent to Europe with a model and some parts. The car, though well known and successful in the United States, was not satisfactory when made by the German maker with European material.

The American industry has grown to such proportions that steel and other material manufacturers seek and cater to the wants of the automobile builder. At the present time there is not, and, in fact, for some time past there has not been the difference between the foreign and the domestic car that formerly existed. If the American engineer is not satisfied with American materials all kinds and grades of foreign materials can now be procured in stock in the American market and at prices commercially practicable.

The only possible reason for the purchase of a foreign car in this country to-day is the same one leads many people to buy English clothes and French hair dyes.

There is an idea very prevalent in some quarters that practically all the cars made in France, England, Italy, Germany and Belgium are as good or better than the better grades of cars made in this country, whereas the reverse is really the truth.

Some of the foreign cars that have had a large sale and vogue in this country and been accepted without question as being of the highest grade were classed as second grade at home. Taking the good and the bad together, the average quality is higher in this country to-day than in Europe.

It is true that there are more builders of high-grade, finely finished cars in Europe than in this country. But their combined output is not as great as the combined output of the relatively few similar makers here. On the other hand, there are practically no cars built here as "rotten" as some foreign ones.

AUTOBUS WILL ANSWER IN PITTSBURGH.

PITTSBURGH, Jan. 25.—Angered by the repeated failures to get the Pittsburgh Railways Company to give them any sort of transfer service across the city, the Duquesne Incline Plane Company has contracted with the Automobile Transfer Company for the hauling of passengers from the foot of the plane on the South Side to Fifth and Liberty avenues, the most central point in the city. The contract calls for automobiles to be furnished every four minutes during the rush hours and every eight minutes during the remainder of the day. The service will be established April 1.

The distance from the foot of the Duquesne incline to Fifth and Liberty is something over a mile. The incline is the main source of access for thousands of people on the South Side hill tops. For a long time the Incline Company issued transfers, which were accepted by the Pittsburgh Railways Company. Lately the "trolley trust" has refused to accept these transfers, and the contract with the Automobile Transfer Company is the result. The cars contracted for will carry 22 passengers each.

USE OF ALUMINUM, NICKEL AND VANADIUM STEEL

By ELWOOD HAYNES, A. L. A. M.

A FEW years ago it was considered impossible to build a self-propelled vehicle for the common roads that could be operated continuously in a practical way because of the very high cost of up-keep. A large part of this excessive maintenance cost was due to the breaking or bending of the various parts of the machine. The early builders of automobiles were not only annoyed almost beyond endurance from this cause, but the problem became so serious that for a time the success or failure of the entire business seemed to hinge upon the possibility of obtaining the materials which would stand the extraordinary stresses imposed by this new means of locomotion.

Elwood Haynes.

Many entertained the idea at first that excessively tough materials would best answer the purpose and hence employed Swedish iron or very low carbon Bessemer steels. These were found to be absolutely unsuitable in many instances, not because of breakage, but on account of the readiness with which they would bend and take excessive and permanent set, thus throwing the parts out of line and rendering the machine in a short time practically inoperative. Higher carbon Bessemer steels were employed with but little advantage; it is true that they were more elastic, but after a limited amount of use they would deteriorate in strength and finally break in most unexpected places.

Introduction and Use of Nickel Steel.

Alloy steels were almost unknown in mechanical construction in the nineties, though nickel-steel had been tested to some extent chiefly by firms supplying armor-plate steel to the Government. However, it was of doubtful utility until introduced into the automobile. The early users of this steel were highly pleased with the extraordinary improvement which it introduced into the machines. First, it proved a great boon in the construction of live rear axles, which when made of ordinary steel, had been bending or breaking to an alarming degree. Next, it was tried in crankshafts, which had also given much trouble. Later, it was used for the construction of sliding gear wheels employed in the transmission of the car. Its introduction was not always attended with satisfactory results, but generally speaking, the improvement which it made was most marked.

Unfortunately a number of builders regarded nickel steel simply as an alloy of iron and nickel containing a certain per-cent. of the latter metal. They were not particular about the other constituents of the alloy or how the steel was made. This was the cause of a great deal of trouble in the early use of nickel steel. Firms that had never had any experience with alloy steels immediately began making nickel steel of inferior quality and placing it upon the market. Much of this steel was too high in carbon for the purpose intended, other samples contained considerable quantities of phosphorus and sulphur, thus rendering them unfit for use, while still others were carelessly made up and little if any superior to the ordinary Bessemer product. Gradually, however, it was learned that certain precautions were necessary to make a good nickel steel and that the steel must be of such a composition as to answer the requirements necessary in a particular part of the machine.

Marked Effect of Introduction of Chromium.

A little later chromium was introduced into the nickel steel and its effect was found to be very marked: but while it greatly improved the strength of the nickel steel, it was found to be very much harder to work, and since it is a triple alloy of iron, chromium and nickel, besides containing various percentages of carbon, its manufacture and manipulation required much greater care than the making of carbon steel or nickel steel. Moreover, the carbon content must be very carefully controlled or the steel will be greatly modified in its properties and may be rendered utterly unsuitable for the purpose intended. Owing the great hardness of this steel in its natural or annealed condition, special tools were required for forming and machining it, and even these did not work it rapidly.

Fortunately at about this time a new alloy tool steel had been compounded which greatly aided in the working of the nickel-chrome steel. This new tool steel is, generally speaking, an alloy of iron, tungsten and chromium, containing but a small per cent. of carbon. It possesses the extraordinary property of becoming exceedingly hard when heated to whiteness and dipped in oil. The hardness thus imparted to the steel is not readily reduced by heating, and for this reason the tools made of this substance will hold a cutting edge even though the iron or steel shavings are heated to redness in the process of turning. It is questionable whether nickel-chrome steel could have been successfully introduced into the automobile without the use of this special tool-steel alloy.

Much difficulty was experienced with the nickel-chrome steel, aside from the difficulty of working it. It is very sensitive to slight differences in temperature employed in tempering it, and to make sure of accurate results a pyrometer must be employed for every operation. Owing to this fact and to the further fact that nickel steel lends itself to a variety of uses, there has arisen a difference of opinion in regard to which of these materials is more suitable to employ. Many high-class builders use a limited amount of both in the different parts of their machines.

Vanadium and Its Peculiar Effects on Steel.

Closely following the nickel-chrome steel came the introduction of vanadium steel, or more properly speaking, vanadium-chrome steel, since vanadium alone is seldom used in automobile steels. The effect of vanadium upon iron and steel has been very carefully studied by Mr. J. Kent-Smith, to whom largely belongs the credit of introducing this valuable material.

Much has been said and written about the peculiar effect of vanadium upon steel. It is generally conceded now that it acts largely as a scavenger and exercises a beneficial influence on almost all of the carbon and alloy steels when introduced in minute quantity during the melting process. Its chief office seems to be that of removing the last traces of oxygen and oxides, as well as minute quantities of nitrogen, which latter element exercises a very bad influence on iron and steel even when present in exceedingly small quantity. It is perfectly certain that vanadium exercises a very beneficial effect upon the finished product, giving it closeness and fineness of grain, splendid elasticity, coupled with extraordinary toughness. Fortunately in addition to these very desirable properties, the steel is sufficiently soft in its annealed state to be turned and machined like ordinary low carbon steel.

Difficulty Experienced in Case-hardening.

One difficulty in the manipulation of this steel is the persistence with which it resists case hardening. While nickel steel takes up carbon readily at a temperature of from 750 to 800 degrees Centigrade, under an exposure of from two to four hours, vanadium steel under the same condition and, in fact, in the same annealing box, shows only a slight penetration by carbon after an exposure of from 10 to 12 hours. This is probably due to its very dense character. It will, however, take up carbon slowly if exposed to a temperature of 900 degrees Centigrade. But a continuous temperature as high as this exercises a rather marked effect upon the furnace and annealing pots —in fact, in case-hardening this steel I have found it advisable to use graphite pots instead of cast-iron ones.

Besides the steels already mentioned, special grades of open-hearth steel may be employed for parts which are not required to resist special stress. And in cases where rigidity rather than high elastic limit is the prime requisite, a good moderately low-carbon steel of high purity will answer as well as an alloy steel. As a matter of fact, the writer has made a large number of tests which indicate that an open-hearth steel of moderate carbon content is stiffer than nickel steel, though not quite so stiff as nickel-chrome steel or vanadium steel.

Suitable Heat Treatment the Keynote.

No matter what steel is employed in the construction of an automobile, its full value is only obtained by suitable treatment. For instance, a ½-inch square bar of nickel steel 6 inches in length supported at both ends resisted a load of 900 pounds when it took a permanent set. The same steel after treatment sustained a load of 2,700 pounds before taking the slightest set. A vanadium-steel bar under the same condition took a permanent set under a load of about 900 pounds; after treatment it resisted a load of 4,000 pounds without taking the slightest set. In fact, the alloy steel before treatment will frequently show but little more strength than good untreated open-hearth steel. The nature of the treatment depends largely upon the use made of the steel, and each manufacturer has a treatment of his own which has been carefully worked out to meet the specific requirements in the various parts of the car.

Besides the various drop forgings, which should never be made of Bessemer steel, high-grade crucible steel castings may be employed for certain parts of the machine. For example, a steel of this character is much better for rear-axle housings than malleable iron; in fact, the latter substance, in the opinion of the writer, should have no place in the car excepting for elbows, tees, etc., which are not subjected to engine stress or road stresses in which dynamic ability is necessary.

Bronzes, Babbitts and Aluminum.

The other metals besides iron and steel employed in the automobile are mainly bronzes of various kinds (including bearing metals, etc.) and aluminum. High-grade babbitt metals are now employed to a considerable extent in the place of bronze, since they have the advantage of never cutting the shaft in case the oil supply should fail. Aluminum castings are employed by nearly all high-class builders for crank-cases and gear-cases. If properly designed, these castings give excellent results; and at the present price of aluminum are probably as cheap as any that could be employed for the purpose. It is a notable fact that the Americans were the first to introduce both aluminum and nickel steel into automobile construction, though it is generally supposed that these progressive steps should be credited to the French. The extensive introduction of vanadium steel is also due to Americans.

The Transformed Automobile a Marvel of the Age.

With improved design in mechanical parts and the introduction of high-grade alloy steels, together with anti-friction bearings wherever practicable, the automobile has been transformed from the uncouth and unreliable mechanism of a few years ago to one of the most perfect and reliable machines in use. It is certainly a high tribute to the scientist, the metallurgist, the engineer, and the designer that this mechanism has been created and perfected within the last few years to such an extent that its power, endurance, reliability, and speed are among the marvels of the age, and its operation rendered so simple that it can be manipulated and controlled with ease by one in no way skilled in the art of mechanics.

AUTOMOBILES MAY SOLVE THE TRAFFIC PROBLEM

BUFFALO, N. Y., Jan. 25.—One of the biggest and vexing problems in any large municipality is the traffic problem, on which engineers and others have spent years in search of the correct solution. This, which might be likened to the squaring of the circle, now appears to be likely, through the use of motor-propelled vehicles. It is now possible to show by official records just how far the supplanting of horses by motor cars has progressed. In a report recently issued by the London traffic branch of the Board of Trade on conditions in London it is shown that between 1903 and 1907 the number of mechanical cabs has increased by 700, while the horse-drawn cab has decreased by 1,500. Motor omnibuses have increased by 1,200 and horse-drawn 'buses have decreased 1,000. Statistics concerning the replacement of private carriages are not given.

Perhaps the most pertinent matter brought out in these facts is that of the saving of space in city streets through the use of motor cars. Almost every city has been confronted with an endless congestion in certain thoroughfares and has faced the necessity of widening the pavements. To show the saving of street space that could be made by the universal use of motor cars, the George N. Pierce Company, of Buffalo, N. Y., has made comparisons between the relative spaces occupied by motor and horse-drawn vehicles. Measurements were taken of the street space occupied by the five models of Pierce Arrow cars and of the more prominent kinds of horse-drawn vehicles. In both cases the length over all was used, the length of the horse vehicles, of course, included the horses. The square feet occupied by the various cars is:

	Horsepower	Length Over all	Sq. Ft.
Pierce Arrow	24	12 ft. 8 in.	59.1
"	36	13 ft. 0 in.	60.7
"	40	14 ft. 5 in.	67.0
"	48	15 ft. 0 in.	70.0
"	60	15 ft. 7 in.	72.8
5-ton truck	45	18 ft. 6 in.	84.0

The measurements of the horsed vehicles are:

	Length over all.	Sq. Ft.
One-horse cab	19 feet	88.7
Two-horse cab	20 feet	93.3
One-horse delivery wagon	20 feet	93.3
Two-horse delivery wagon	20 feet	93.3
Moving van	24 feet	112.0
Brewery wagon	26 feet	121.1

The most striking comparison is that between the six-cylinder, 60-horsepower car with a seating capacity of seven persons and the one-horse cab. The touring car requires 72.8 square feet of street and the one-horse cab 88.7 feet, a clear saving of 15.9 feet, or 18 per cent., of street space. With the smaller 24-horsepower car, which conforms more closely to the one-horse cab in seating capacity, the difference is even more noticeable. The automobile occupies only 59.1 square feet, giving a difference of 28.6 square feet, or 32 per cent.

Another striking illustration is the space saved by the motor truck. A five-ton truck is the illustration in this case, and the nearest approach to this is the brewery wagon. This occupies 37.1 square feet more street space than the truck, so the use of the latter would mean a saving of 69 per cent.

The figures were shown to an engineer in Buffalo with considerable experience in municipal problems, whose first statement was:

"It looks as if one of the most vexing problems on municipalities—that of increasing the pavement space to prevent the congestion of traffic—will work out through the automobile. Every city of any size has had the question forced on its attention at one time or another, but the more general use of the automobile would allow putting off consideration of it for years enough to bring out some new method of handling street traffic without disturbing existing building lines. At that time, with automobiles in general use, we will have thought out some plan that will relieve the congestion in a manner undreamed of now."

CONCERNING DOUBLE IGNITION PATENT CLAIMS

FROM the Bartholomew Company, of Peoria, Ill., makers of the Glide, come copies of some correspondence which has passed between that company and Elmer Apperson, of Kokomo, Ind., in reference to the double ignition patent claims put forth by the latter. The letters tell the story in such manner as to make it perfectly clear that the patentee will have to go to court before obtaining royalties from this particular concern. Herewith the correspondence is presented in full, containing some information which may be of interest to many readers:

From Elmer Apperson to Bartholomew Company.

APPERSON BROS. AUTOMOBILE CO.
KOKOMO, IND., December 24, 1908.

The Bartholomew Company, Peoria, Ill.:

Gentlemen:—In connection with the motors which you are using, do you use two or more separate electric igniting devices, provided with separato circuits and with means for throwing the igniting devices into or out of action simultaneously or independently, as well as covering the use of two or more spark plugs or sparking points having electrical connections with a magneto and battery with means for throwing the spark plugs or points into or out of operation?

If so, do you consider such method of ignition of value?

I am the owner of Letters Patent of the United States No. 617,806, granted to F. E. Canda, January 17, 1899, for electric igniter for explosion engines, and also of Letters Patent No. 905,625, granted to Elmer Apperson, December 1, 1908, for improvements in explosion engines.

I have no disposition to unnecessarily embarrass any manufacturer now using the device on which I own broad and strong patents. I have spent much time and money in developing this system of ignition to its present effectiveness, and believe that any manufacturer will hold that an owner of a patent of value is entitled to a reasonable compensation therefrom.

If you are now using the system, and if you wish to continue using it, or if you desire to commence using it, I should be glad to hear from you in the near future, and there is no douht but what we can make arrangements that will prove to be mutually satisfactory. I shall appreciate having your reply to this letter by early mail. Yours very truly,

ELMER APPERSON.

From Bartholomew Company to Elmer Apperson.

THE BARTHOLOMEW COMPANY.
PEORIA, ILL., January 11, 1909.

Mr. Elmer Apperson, Kokomo, Ind.:

Dear Sir:—We have received your notice concerning the alleged inventions and patents. Concerning this patent to yourself of December 1, 1908, application filed July 3, 1906, we are compelled to say that we cannot recognize this patent as a legal patent, for we had been making cars more than three years prior to the date of this application, containing two spark plugs and the other elements mentioned in the patent. Many of these cars were made and put on the market at that period.

If you should like to have any information concerning the matter, or data, we will hold ourselves in readiness to give it to you any time you come to Peoria. This offer is made in a friendly way, and until such time as we have either had an opportunity to show you in person or in a friendly way the situation as outlined above, or before the court, if it is your pleasure we will drop the matter of this particular patent.

As to the patent of F. E. Canda of January 17, 1909, application filed August 26, 1907: In our opinion this patent does not relate to ignition devices whereby a battery is used for ignition on one set of electrical apparatus and a magneto is used for ignition on another set of electrical apparatus, which are both entirely independent and in nowise connected with each other, each having a switch for throwing it in and out entirely independent of the other.

Kindly let us know if you do not agree with us with reference to the Canda claims. Yours very truly,

THE BARTHOLOMEW COMPANY,
Per J. B. BARTHOLOMEW, President.

From Elmer Apperson to Bartholomew Company.

APPERSON BROS. AUTOMOBILE CO.
KOKOMO, IND., January 13, 1909.

The Bartholomew Company, Peoria, Ill.:

Gentlemen:—I have just received your letter of the 11th, and note what you say about your having used two spark plugs in each cylinder more than three years prior to the date of the application of my patent. If you were using spark plugs of this nature three years prior to 1906 I failed to hear of you; in fact, I do not remember of any such concern being in the automobile business in 1903 or prior to that time. In fact, at the present time I do not know or hear of your making very many automobiles, so that in reality what we might collect from you would not be large, to say the most; but in our opinion, it is a fact that you copied this double ignition system from cars which I exhibited at the Chicago show during the Winter of 1904 and 1905. You state in one paragraph of your letter that "many of these cars were made and put on the market at that period." Will you kindly refer me to some one to whom you sold cars as far back as 1903? If you actually made cars in 1903 using two complete systems of ignition, using two spark plugs in each cylinder, I should be very glad for the information, and will have an apology to offer for the statement that I did not know you were in the automobile business at that time. The Canda patent covers one or more sparking points in the same cylinder. Very truly yours,

APPERSON BROS. AUTOMOBILE COMPANY,
Per ELMER APPERSON.

From Bartholomew Company to Elmer Apperson.

THE BARTHOLOMEW COMPANY.
PEORIA, ILL., January 16, 1909.

Mr. Elmer Apperson, Care of Apperson Bros. Auto Co., Kokomo, Ind.:

Dear Sir:—In response to yours of the 13th, beg to say the tone of your letter reminds the writer of the old story of the fellow who was so deafened by the rattle of his own cart and so blinded by the dust he was kicking up himself that he had seen or heard of no one else along the highway.

The dust you are stirring,
Is still in the air.
You will have to ride through it.
Better stir it with care.

We took your notification in good faith and thought you would be interested in the information our letter contained, for we know, as a matter of fact, there are a good many erroneous impressions that exist among the people engaged in the automobile industry; and while we have been modest in our operations, we have been busily engaged in the business of turning out automobiles to the trade ever since 1900, but the most of our experimental history dates back of even that, and you might be interested to know, as a matter of history, concerning the industry, that in our shops an automobile was made as early as 1889. While it was a very crude affair, it actually traveled half way across one big State and entirely across another, and from that time on we have been more or less engaged in one way or another in automobile experiments, construction and exploiting; but nevertheless, during this period were very busily engaged in the manufacture of other machinery.

In 1893, on behalf of my company, I negotiated a contract with Mr. Charles E. Duryea et al., in which contract the undertaking was the production of a gasoline automobile of his design, and this was done before he had completed any working drawings, and it might be interesting to you to know that one of our present stockholders made all of his drawings, covering all of his various constructions up to the date he moved from Peoria to Reading.

As a result of this connection, automobiles of his design were produced here in Peoria, and within the next fifteen months or such a matter were running on the streets of Peoria, and these machines, I believe, are still in existence.

In our foundry, in 1894, we made the first cylinder castings from Mr. Duryea's first pattern. This may or may not have bearing on the questions under consideration; but it is interesting, nevertheless, to know that in his construction the cylinders were all cast integral, a system of manufacturing that is being promoted by some of the more recent concerns, and is strongly advocated because of its being of French origin. (?) We have the first casting that was made from his pattern in our sample-room at the present time, and it is held there as a relic, having been cast as early as 1894.

Without going into detail as to what happened from that time down to 1900, except to say the writer was in some manner or other more or less engaged in the exploiting of motor-driven vehicles, but in 1900 we had arrived at the point where we were ready to commence the delivery of Glide cars to the trade, and while, as before stated, our movements have been conducted in a modest way, we want to answer that part of your letter which states you failed to hear of us and do not remember of any such concern being in the automobile business in 1903 or prior to that time, and even now do not hear of our making very many automobiles, by informing you that there are at the present time more Glide cars in the hands of users than there are cars manufactured

by all other automobile manufacturers of Kokomo, Ind., put together.

We did state in our former letter that many of these cars were made and put on the market at that period, namely, as far back as 1903, and if we understand your letter, you want us to qualify as to the meaning of many. We turned out machines enough and got publicity enough in our work to destroy the value of any patent that might have been taken out unbeknown to us on devices we had produced and put on the market to what we term the extent of many.

For this purpose it seems to me that five would be enough to justify in saying many, although we put out more than 100 machines, and, to answer your inquiry, we will give you the name of H. H. Bliss, Ouray Building, Washington, D. C., as the party to whom we shipped one of our cars on October 6, 1903, and will say also that there were 12 other machines of the same pattern built and delivered the same month of that same year, all of which were equipped with the double spark plug system, which was our common practice during that entire season.

So when you have established these facts you will be able to see clearly that these machines could not have been copied from your machine shown in the Winter of 1905 at the Chicago Automobile Show. In this connection, we are prompted to suggest that possibly you might have seen our machine with the two-spark plug system exhibited at the Chicago Automobile Show in February, 1904. It was there, and the writer remembers distinctly of a man by the name of "Apperson"—either that year or the year before—coming onto our space, but as I understood it, he was with the Haynes-Apperson Automobile Company.

We made our first exhibit at the show in February, 1903, and if you care to look this matter up you can write to S. A. Miles, and ask him if we did not pay him for space on February 19, 1903. We have exhibited at the Chicago show every year since, and we do not understand how you could have overlooked these important exhibitions we have given. Some of them have been exceedingly attractive and interesting.

Concerning the Canda patents, if you will turn back to our letter of the 11th and read it carefully you will see your statement, "The Canda patent covers one or more sparking points in the same cylinder," does not answer in that it does not agree or disagree with our opinion as stated.

You might be excused for making a statement of this kind, if you did not know better. We will assume you have written your letter without knowledge as to the exact character of the claims of this patent. Nevertheless, inasmuch as we have taken this matter up in good faith with you, we believe we are entitled to an expression from you as to whether or not you entertain our opinion or disagree with us concerning this patent.

Therefore, we want to put the matter up to you squarely in this way: If our machines for 1909 are made with two sets of spark plugs for each cylinder, with a battery circuit for one plug to each cylinder and a magneto circuit for the other plug to each cylinder, both circuits entirely separate from each other, with a separate switch for each circuit to throw it on and off, under such circumstancea would you consider our product an infringement of the Canda patent?

You say if we actually made cars in 1903, using two complete systems of ignition, using two spark plugs in each cylinder, you would be very glad for the information, and will have an apology to offer for the statement that you did not know we were in the automobile business. You can make the apology now or wait until you have further evidence; but it is going to be up to you.

And now one word in conclusion, and that is, Mr. Apperson, is it not possible that since you were not familiar with those engaged in the automobile business at this earlier period and with what they were doing, that there are many other things in the art about which you are not well informed?

Yours very truly,

THE BARTHOLOMEW COMPANY,
Per J. B. BARTHOLOMEW, President.

NEW BOOKS FOR THE AUTOIST

Magnetos for Automobilists.—This 64-page book is written by S. R. Bottone, and the publisher is the D. Van Nostrand Company, New York City. The book is full of meat in acceptable form for the autoist who wants to know about magnetos and other means of ignition. It is a skilled résumé of the situation, involving as it does divers problems, intricate in a sense, so plainly depicted as to clearly indicate the skill of the author, who, by the way, is too well known to require any introduction at all. The historical chapter is of interest, and is followed by a chapter about materials; then there is a discussion of special forms, and enough to say on the phase of the problem involving the several applications, with deductions of value. The price of the book is $1.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

Jan. 27-Feb. 3..Philadelphia, Second Regiment Armory, Eighth Annual Show, Philadelphia Automobile Trade Association.

Feb. 6-13.....Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. S. A. Miles, Manager, 7 East 42d St., New York.

Feb. 15-20.....St. Louis, New Coliseum Building, Third Annual Show, St. Louis Automobile Manufacturers' and Dealers' Association. John J. Behen, Chairman.

Feb. 15-20.....Detroit, Wayne Pavilion, Annual Show, Detroit Automobile Dealers' Association. E. LeRoy Pelletier, Manager.

Feb. 22-27.....Cleveland, First Regiment Armory, Annual Show, Cleveland Automobile Dealers' Company.

Feb. 15-20.....Bangor, Me., Auditorium, Eastern Maine Automobile Show.

Feb. 16-18.....Denver, Colo., Auditorium, First Annual Automobile Show, Denver Motor Club.

Feb. 18-25.....Toronto, St. Lawrence Arena, Third Annual National Automobile, Motor Boat and Sportsmen's Exhibition. Ontario Motor League. R. M. Jaffray, Manager.

Feb. 20-27.....Newark, N. J., Essex Troop Armory, Roseville Avenue. Second Annual Show New Jersey Automobile Trade Association. H. A. Bonnell, Manager.

Feb. 20-27.....Hartford, Conn., Second Annual Show, Hartford Automobile Dealers' Association.

Feb. 24-27.....Omaha, Fourth Annual Automobile Show, Omaha Automobile Show Association. C. N. Powell, Sec'y.

Mar. 1-6.....Buffalo, Convention Hall, Annual Show, Automobile Club of Buffalo. D. H. Lewis, Secretary.

Mar. 6-13.....Boston, Mechanics Building, Seventh Annual Automobile Show, Boston Automobile Dealers' Association. C. I. Campbell, Manager, 5 Park Square.

Mar. 8-13.....Kansas City, Kansas City Automobile Dealers' Association Show.

Mar. 8-14.....Portland, Ore., First Annual Automobile and Sportsman's Show, Portland Automobile Club. W. F. Lipman, Secretary.

Mar. 11-13.....Milwaukee, Wis., Hippodrome, First Annual Show of Milwaukee Automobile Club.

Mar. 13-20.....Minneapolis, Minn., National Guard Armory, Second Annual Show, Minneapolis Automobile Show Association. F. E. Murphy, Secretary.

Mar. 15-20.....Rochester, N. Y., Convention Hall, Annual Show, Rochester Automobile Dealers' Association. Charles J. Moran, Exhibition Manager.

LETTERS INTERESTING AND INSTRUCTIVE

TO MAKE THE SPRINGS BEHAVE PROPERLY.

Editor THE AUTOMOBILE:

[1,711.]—I have followed your articles on springs and shock absorbers with great interest, but have not found definite answers to some questions. My runabout has rear seat attachment, and when heavily loaded rides very nicely, but as a runabout is "hard" riding, the springs being evidently much too stiff. As I understand it, there is no kind of shock absorbers that would help matters in this case. I could make room for coil springs, made to order, at the end of the present leaf springs that would give three or possibly four inches of play there on the principle of those spiral springs I see advertised for this purpose. I am afraid the advertised ones would not give me enough play to be of much value.

Please advise me what can best be done to make it ride as easy when as a runabout as with 400 pounds more in it. Could I use coil springs to take the place of the 400 pounds extra weight to act in opposition to the leaf springs now on there? It seems to me this would work if the coil springs could be made to exert about the same pressure through their required range of action. How would it be to put on light springs that would give the body chance to come down four or five inches before bumping and some kind of shock absorbers that would cause the oscillating movements to be slower? In fact, I don't believe the "level platform" is so important as it is to reduce the rapidity of the up and down motion to a point where it ceases to throw us. I am bound to do something to make this car ride easier, but I do not know what to do, and your opinion will carry much weight with it.

Fulton, N. Y. CHARLES V. ARMSTRONG.

The problem is one to give you some little trouble any way you care to look at it. As a general proposition, it is necessary to stress the materials of which the springs are made to a point bordering upon the elastic limit, if it is desired to realize easy riding qualities with quite wide variations of the load. To take advantage of this method of proceeding requires the use of materials such as will stand the work for a length of time said to be satisfactory. Simultaneously, it is necessary to have the springs so long that the vertical bounce will be at a slow rate. This is a matter depending upon the length of the springs, just as the swing of a pendulum is dependent upon the length. When the length of a spring is fixed on a basis to satisfy this phase of the subject, then it is time to determine as to the volume of the material, such as will absorb the energy represented in the motion of the mass and the rate of change thereof. On the other hand, as before stated, if the material is not stressed to a point very near the elastic limit of the same, motion will not be arrested in a way to satisfy the conditions, especially if it is true that the load is not to be the same at all times. Whether or not you can approximate the conditions you have in mind through the use of coil springs, is a question to be arrived at on a basis called "cut and try." The "level platform," as referred to by you, is desirable, but you will have to go over the literature on the subject again; you failed to absorb the information.

EXPERIENCE WILL BEST TELL THE TALE.

Editor THE AUTOMOBILE:

[1,712.]—May an automobile agency be made a feasible, paying project in a small town, the total territory alloted to include three adjacent counties, fairly well populated and containing a number of small cities and villages? The promoter is a practising dentist who would do the correspondence and advertising from his office, and his partner is a reliable and dependable man who would give all his time to demonstrating and closing sales in all parts of the territory. A conveniently located barn can be rented for keeping a few machines in on arrival, obviating the necessity of an investment for that purpose. An agency for a reliable and very popular line can be secured on making a small cash deposit for five cars. What do you think of such a venture? A SUBSCRIBER.

Cumberland, Wis.

The proposition sounds all right and you have probably taken into account such conditions as roads, the class of people you will deal with, etc. You are very likely to find that some provision for small repairs will have to be made at an early date if you intend to establish an agency on a sound basis. Your customers will have to be taken care of.

TO DETERMINE GEAR RATIOS IN GEAR BOX.

Editor THE AUTOMOBILE:

[1,713.]—Kindly publish, in this week's issue if possible, how you would determine the ratio of the gears in a car when same is on low gear, i.e., providing the standard ratio of the rear axle gears is 3:5 to 1 or 4 to 1. INTERESTED.

Given the fixed gear ratio in rear axle, the ratio of the gears in the gear-box may be determined by first fixing the speed at which you wish the car to travel with the motor turning over at a given number of revolutions per minute.

Let:

(1) The fixed reduction = 3.5 to 1.

(2) The speed of the car (for low gear) = eight miles per hour at 1,000 r.p.m. of the motor.

(3) The diameter of the rear wheels = 34 inches.

To travel eight miles per hour 34-inch wheels must make 79 (approx.) revolutions per minute, and with a 3.5 to 1 ratio in bevel-gear drive, the propeller shaft must make $79 \times 3.5 = 277$ r.p.m. (approx.). Then with a motor speed of 1,000 r.p.m. and propeller shaft turning at 277 r.p.m., the ratio of the low-speed gears will be as 1,000 is to 277, or about 3.6 to 1, giving a total reduction of about 12.5 to 1.

If you have access to an "Automobile Trade Directory" you will find tables on page 408 which will be of assistance in calculating these ratios.

INFLUENCE OF KEROSENE ON LUBRICATING OIL.

Editor THE AUTOMOBILE:

[1,714.]—What is recommended for lubricating oil in the automobile to keep the oil from congealing when the car is used in extremely cold weather? The belief is that kerosene or gasoline is sometimes mixed with the oil for the purpose. Can you advise as to the right proportions to use? B. B. B.

Waterbury, Conn.

Excess mobility in lubricating oil is the phenomenon noted when the oil shows a decided tendency to solidify as the temperature is lowered. The right grade of oil would be the grade which would hold to a constant viscosity under all likely conditions of temperature. Some of the grades of oil are more perfect in this respect than are others and it is advantageous to pay more money for the grades of oil which do show the requisite properties.

Constant mobility is quite out of the question, to be sure, and the refiners of oil practice the art of furnishing lubricating oil in several selections as respects viscosity. The right course, then, is to use thin oil in cold weather, thin enough so that it will flow, and as the weather warms up the selection should be in favor of the heavier grades of oil.

As respects kerosene and gasoline in the lubricating oil, enough it is to say the oil is ruined for the purpose of lubricating if it is thus diluted. Proof of this is given in the plan by which kerosene is used in clutch oil if the clutch will not hold. In a word, lubricating oil in the clutch is too slippery, and kerosene is added to diminish the unctuousness on the one hand, and a still more important property on the other, namely, the ability of lubricating oil to persist in remaining between two surfaces under great pressure. In the case of the clutch it is desired to have the oil squeeze out from the discs with ease. This case would be ruinous to a crankshaft bearing, as will be self-evident.

But the story is not even half told: the "flash point" of the lubricating oil is of the greatest importance, and this point will be much altered if the oil is tinkered with. The flash point of kerosene is low in comparison with the same point of lubricating oil, and while the writer has not the data of the resultant flash point before him, yet even so it is a good guess that the resultant flash point will be so low as to defeat the whole project.

Constantly feeding kerosene to the cylinders of a motor, even

if the same is sneaked in with the lubricating oil, is bound to result in the unbalancing of the explosive mixture, and, too, it is plain that the question of "carbon deposit" will be rendered the more prominent. Nor is it believed that the question is all in; it would be a subject for more than a little investigation before all the ills of such a procedure would be on the surface; the trouble is that the reasons as they are known are so many and so formidable as to demand no further thought at the expense of time or money.

BROKEN-DOWN SPARK COIL HARD TO REPAIR.

Editor THE AUTOMOBILE:

[1,715.]—I would like to have your opinion on the following: I have a double Caunet (?) coil, which has been working quite well until the last few weeks. But there seems to be a short circuit somewhere in the coil when there is no contact at the timer and when the current is thrown on a small spark may be seen at the plugs if the secondary is touched to the plug. What part of the coil is most likely to be injured? Will the current break through the insulation on the primary windings of the coil? How does this current get through the coil? The coil will buzz only part of the time. Where is the "safety gap" put in the coil? Would it help matters any to re-wind the secondary? E. H. SCHROEDER.

High River, Alta.

It would be within the range of facts to consider that the timer is short-circuited. If the timer is out of order it will be easy to account for the intermittent service you claim is rendered. If there is a "safety gap" provided it will be in sight. As regards the breaking down of the insulation in the coil, it is probably due to the building up of the electromotive force to a point in excess of the ability of the insulation on the windings. Sometimes it is possible for the coil to work even with a partial short-circuit, and you will find that by closing in the gap of the plugs to the minimum (say, the thickness of a visiting card) the insulation will be relieved of much of the electrostatic strain and it may then be capable of sustaining in service.

You will not be able to rewind the secondary, in all probability, for the reason that the winding is of great length, and it is done in a machine. You would have difficulty in getting so much wire on the spool even were you to use new wire. If the coil is not filled with paraffine you can bake it in an oven at a gentle heat for some time to drive out the water and then you can boil it in paraffine, which may be the means of lifting the short circuit, if one there is.

Before doing anything to the coil look for your trouble in the wiring or in the timer. Make sure that the battery is in good order and examine the ground connections. A loose joint would do just what you claim is happening.

CHAUFFEUR IS REGARDED AS A PAID EMPLOYEE.

Editor THE AUTOMOBILE:

[1,716.]—Please answer the following questions in THE AUTOMOBILE as soon as possible:

1. Is there any difference between a driver and a chauffeur?
2. Is it necessary for a chauffeur to have a license in Iowa? In other States? How may it be obtained?
3. Where could I get a book which maps out all the country roads in the central and eastern part of Iowa? A READER.

Onita, Ia.

(1) If you drive your own car you are not a chauffeur; on the other hand, if you are a chauffeur you are also a driver; it is fair to explain the situation as it seems to adhere to the minds of autoists in general. On the other hand, the word "chauffeur" is defined as a noun and the chauffeur is defined as fireman, stoker and on certain other occasions as a robber. (See Spiers & Surenne's French Pronouncing Dictionary.) Taking the last definition as the correct one, it is plain that you cannot drive your own car as a chauffeur. In all probability, the word chauffeur was expanded to include drivers of automobiles, through the use of steam boilers and engines, in the early types of automobiles. They were so designed as to require a fireman (chauffeur) and when the change came the fireman was advanced to the new position, holding to the old name. In this will be seen evidence of the fact that the chauffeur is as a paid employee.

(2) The paid employee may be required to take out a license. You, as an owner, will not have to do so, but you will have to file your name and address, with a description of the machine, on a prepared blank in the office of the Secretary of State. Upon application the Secretary will forward to you a blank for the purpose. As a chauffeur apply to the office of the Secretary of State (by letter) for a copy of the law in relation to the matter. For other States go through the same process.

(3) A book mapping all the country roads in Iowa may be difficult to find. The "Automobile Blue Book" is the nearest thing to it.

COMPOUNDS FOR PROLONGING LIFE OF RUBBER.

Editor THE AUTOMOBILE:

[1,717.]—Kindly tell me what you may know of the virtue or otherwise of a liquid on the market known as "Rubberlife." It is said to harden, increase the resiliency and revive rubber; therefore to greatly prolong the life of automobile tires when duly applied. L. N. DAVIS, M.D.

Farmland, Ind.

Possibly the makers of the product to which you refer will be willing to advise you of the qualities of the material for the purpose. In the meantime it may not be out of place to observe that it is not desirable to "harden" the rubber; what is wanted is to conserve the good condition which is present in the new tires. If the air is the cushion in fact and the tire is merely an envelope, it is a fact that the minimum value of the equation which follows is what is wanted.

$$\frac{\text{Work required to strain the body}}{\text{Work returned by the body}} = \text{minimum value for best result.}$$

It would seem as if the tire should be as flexible as possible if the loss in the tire is to be the minimum. The life of rubber is prolonged if it is kept free from wounds, and if the atmosphere is not too dry, provided "direct light" is warded off. Tires should be allowed to hold to their natural shape, else the fabric will become weakened in consequence of deformations.

WANTS TO KNOW ABOUT SPROCKET RATIOS.

Editor THE AUTOMOBILE:

[1,718.]—Would a 24-tooth sprocket be a suitable sized one for the rear axle of a light 12-horsepower runabout having a planetary transmission fitted with a 10-tooth sprocket? Direct drive by roller chain is used. The engine is a horizontal opposed, with 4 1-4-inch cylinders, and runs at the average rate of speed of this type. The rear wheels have 30x3 1-2-inch tires. Will you please mention some of the sprocket ratios used on different chain-driven cars of about this power?

If you can give me the name of a firm from which one could obtain 4 1-4-inch piston rings, 5-16-inch wide, and answer the above, you will greatly oblige, M. R. S.

Springfield, Mass.

Would recommend that you use 14 teeth in the pinion, and use at least three times as many teeth in the mate. If you are compelled to keep to a low limit, then it is to tolerate a condition which cannot be looked upon as healthy. On high gear the ratio ranges between 3 to 4 in usual cases. You can procure what you want by way of piston rings from the maker of your motor, or, from some maker of motors; see advertising columns of THE AUTOMOBILE. Then there is the "Automobile Trade Directory," in which you will find much valuable information in relation to such and kindred matters.

TAKE A LOOK AT THE IGNITION SYSTEM.

Editor THE AUTOMOBILE:

[1,719.]—I saw an answer to my inquiry in "Letters Interesting and Instructive" in your show number. I have put a Schebler on my Franklin 1904 car, and still it will not start without priming when cold, no matter how hard I turn the motor over, although the motor does not choke up when I open the throttle up. Can you give me any remedy for this? I saw an article in "The Automobile" in this same department saying that by putting a teaspoonful of flake graphite in the lubricating oil every two weeks it would give motor good compression. Would graphite (flake) hurt an air-cooled motor?

How is the low speed and reverse tightened up on the 1904 Franklin? It has a planetary transmission. Do you have any diagram of how to put a fan in a 1904 Franklin, and what would be needed in the way of fixtures and bearings?

Your show number was certainly a dandy. Keep up the good work and you will never know failure.

Corona, L. I. CHARLES B. FRANKS.

One of two points will have to be settled before you can make any further headway. In the first place you cannot be sure that your new carbureter is properly adjusted until the motor can be started without priming. In the meantime take a look at the ignition system and see if it is all right. Make sure of the battery.

Graphite in proper form should be of advantage to you. Confer with the venders of the same; they will gladly give you the benefit of a vast experience.

Write to the Franklin Company; the chances of realizing the best information from first sources are always good.

ABOUT THE FIXED POINT OF IGNITION.

Editor THE AUTOMOBILE:

[1,720.]—Will you kindly publish in your "Letters Interesting and Instructive" some information on two types of magnetos, viz., one using a spark advance, as in the battery and coil system, and the other using a fixed point of ignition. I contemplate adding a magneto to the equipment on my car and have been told and think I have read in your columns that the fixed point of ignition was the better of the two, as it tended to lengthen the life of the motor and give as good service as the system which used the advance. Will you please state in your columns whether the system using the fixed point of ignition is O. K. and whether or not it will give the same results as the other system? An answer to my query will be appreciated. CINCINNATI.

Cincinnati, O.

By using the magneto with the fixed point of ignition you will get a good average result and through its use the possibility of bad performances are at a minimum. In very large motors the cranking difficulty is great. In certain classes of service it is an advantage to have the fixed point of ignition, as in taxicab work, but it is not necessary to an autoist who drives his own car.

BUT A. A. A. CLUBS ARE DOING MUCH.

Editor THE AUTOMOBILE:

[1,721.]—Quite a few months ago I wrote an article which you published, suggesting the formation of an "Automobile Owners' Protective Association." This, I believe, is becoming more of a necessity every day, as it is the only way to remedy many abuses we have now to endure, such as extortionate charges of some garages and hotels; using of cars for so-called "joy rides"; unjust arrests by constables or deputy sheriffs, otherwise known to owners as "road agents."

There are many benefits to be gained by owners getting together, such as combined purchasing power, besides endeavoring to correct above evils; also aiding members on road when they are in any kind of trouble; in fact, the subject is so full of suggestions and possibilities and benefits, such as are not derived from belonging to a local automobile club—for that is more of a social affair—whereas what I suggest is a business matter for mutual protection and profit to its members. WILLIAM D. THOMAS.

Brooklyn, N. Y.

Is it not possible to induce the automobile club to extend its zone of activity, if it is generally believed that there is a need for these added benefits.

THE USE OF LEATHER TIRE CASINGS.

Editor THE AUTOMOBILE:

[1,722.]—I would like to know through "Letters Interesting and Instructive" if the leather tire casings which are advertised are good. Do they protect the case and prevent so-called punctures? As all the ruptures that I have had come on the inside of the tube next the rim, will the case last longer with them? Will not gravel and sand get in between the cover and the case and chafe? Do they make the car run harder? Please give me the advantages of them, if any. W. F. STETSON.

Cherry Creek, N. Y.

Anything which will tend to increase the life of the tires is good, and as many autoists continue to use the leather casings it is pretty good evidence that they are doing good work.

DEPENDS UPON THE AUTOMOBILE ENTIRELY.

Editor THE AUTOMOBILE:

[1,723.]—Would you please tell me in your "Letters Interesting and Instructive" what angle do the forward wheels take when making a short turn and how to find the answer of any turn?

New York. M. L. C.

As a general statement it will be possible to say the wheels cant over about 36 degrees, maximum. As a matter of fact, the maximum possible cant is dependent upon the section of the tires, the diameter of the road wheels, and the space between the wheels and the chassis frame. On the other hand, the mean turning radius of a car depends upon the length of the wheelbase of the same, if it is desired to avoid undue tire strains. Taking the length of the wheelbase as the sine of the angle, then it is possible to ascertain, that the radius, which will be found on a basis of the sine given, will equal the mean turning radius of the car.

FRANKLIN CONCENTRIC VALVE PERFORMANCE.

Editor THE AUTOMOBILE:

[1,724.]—I have been much interested in the "Letters Interesting and Instructive" department of your paper, and as I have just purchased a Franklin, Type D, car (not yet received), will appreciate a detailed explanation of the working of the Franklin concentric valve. W. K. E.

Charleston, W. Va.

You will find the literature of the Franklin Company is so plain as to serve your purpose most thoroughly if you will look it over. Any explanation of the working of the concentric valves that might be printed here would simply be a repetition of that contained in the Franklin instruction book.

DOPE IN THE GASOLINE.

Editor THE AUTOMOBILE:

[1,725.]—What amount of ether do some racing cars use in their gasoline; someone said two teaspoonfuls to a gallon. Is this correct? What is the use of having ball and socket joints for brake rods and other minor parts instead of simple clevis joints?

Middletown, N. Y. A SUBSCRIBER.

We have no definite information in relation to ether in gasoline. Perforce, some user will enlighten us through the columns of "Letters Interesting and Instructive." The ball joint is adjustable, and the surface is that of a sphere, which is the maximum.

ANTI-FREEZING SOLUTIONS IN THE SOUTH.

Editor THE AUTOMOBILE:

[1,726.]—Kindly advise me what is the best anti-freeze to use and proportion necessary to prevent freezing at different temperatures.

Columbia, S. C. S. B. FISHBURNE, M.D.

If raw corn whiskey is cheaper in the South than alcohol, use it. Add to the whiskey an equal amount of water. It may "slush" at a very low temperature, which will do no harm. See issue of THE AUTOMOBILE, November 19, 1908, it deals with this question at some length.

HOW OLD IS AN ODOMETER?

Editor THE AUTOMOBILE:

[1,727.]—In the "Diary of John Evelyn," published by Charles Scribner & Sons, New York, under date of August 6, 1657, is the following:

> "I went to see Col. Blount, who shewed me the application of the WAY-WISER to a coach, exactly measuring the miles, and shewing them by an index as we went on. It had three circles, one pointing to the number of rods, another to the miles by 10 to 1,000, with all the subdivisions of quarters; very pretty and usefull."

This shows its use at lesst 250 years ago, and may be interesting information to some of your readers. X. Y. Z.

Portsmouth, N. H.

SKEIN IS UNRAVELED FOR NO. 1,696.

Editor THE AUTOMOBILE:

[1,728.]—The carbureter popping in the case of No. 1,696 is undoubtedly due to a leaky valve. Had the same trouble myself. Repairmen were puzzled, and, after I had spent over $100, a new cylinder and valves cured the trouble. ELIOT GORTON.

Summit, N. J.

Earl Russell's White Steamer Bears British No. "A-1."

WHITE STEAMER FIRST CAR IN BRITAIN.

LONDON, Jan. 21.—On the last day of 1908 the total number of motor vehicles registered in London to date reached just short of the 40,000 mark. It is interesting to note that the first of this big number was a White steamer, the property of Earl Russell, which consequently has A1 on its number plates. The accompanying photos of this car were taken at Ramsey, Isle of Man, at the last of the Tourist Trophy races. Earl Russell, who is a member of the R. A. C. committee, is in the driving seat, with the chauffeur alongside. Lady Russell is sitting in the back of the car, and standing up in the tonneau is Col. Holden, the ex-chairman of the competitions committee, while at the side is Mr. Merwyn O'Gorman, chairman of the technical committee.

WHAT MICHIGAN'S ROAD MAKER WANTS.

DETROIT, Jan. 18.—If State Highway Commissioner Horatio S. Earle has his way automobilists will no longer be permitted to spin about the State utilizing the model highways constructed primarily for the benefit of the honest tiller of the soil without paying for the privilege. Commissioner Earle will ask the present Legislature to impose a tax on automobiles for road purposes, the rate proposed being 10 cents per horsepower per year. As there are some 7,000 automobiles owned in Michigan, it will be seen that such a course would add a nice little sum each year to the good roads fund.

However, Michigan is already contributing liberally to the good roads cause. Commissioner Earle will ask for $215,000 from the Legislature this year and $320,000 next. Inasmuch as there are more automobiles manufactured in Detroit and Michigan than in a similar area in the country, and inasmuch as the makers and owners are called upon to bear their portion of the good roads appropriation in addition to the proposed tax, it is not at all likely that Commissioner Earle will have clear sailing with his latest project, motorists generally feeling that they are doing their share without the imposition of a further burden.

SENATE SAYS TAFT CANNOT HAVE AUTOS.

WASHINGTON, Jan. 21.—President Taft will have to walk, stick to the saddle or be conveyed from place to place in street cars or in horse-drawn vehicles.

The Senate Committee on Appropriations to-day ran across an item in the Urgent Deficiency Bill granting $12,000 for the purchase and care of automobiles for the use of the executive office. The automobile has not made many friends in the Senate, as was disclosed in the debate of the last few days on the proposed purchase of such vehicles for government officials, and the committee struck the item out. The appropriateness of the automobile in the service of the President is scarcely to be questioned, and it is pretty nearly certain that Congress will reconsider anon.

OREGON'S COOS BAY COUNTRY.

PORTLAND, ORE., Jan. 23.—One of the richest endowed regions, from a scenic point of view, anywhere on the Pacific Coast will, it is believed, be this year opened up and made easy of access for the tourist's automobile. This is the Coos Bay country and the mountains lying between this natural harbor and the railroad. All this district has been penertated by only a few automobilists.

The State of Oregon has within its borders three or four regions of high cultivation within themselves, but difficult to reach from the outside for several months each year. The Coos Bay country in the southwestern part of the State is accessible by land only after a long stage ride which, no matter which route the traveler takes, is about 60 miles.

So general has become the demand for better roads that it is now determined the present year shall see the completion of a better highway from Roseburg, on the Southern Pacific, to Coos Bay, on which are several live, thriving towns. The question at present is not whether there shall be a road, but which route shall be utilized. One road brings the traveler from the railway to Myrtle Point, where after a long stage journey he takes the little railroad which skirts the shores of the bay. The other route is called the Coos Bay wagon road. Both routes are now covered by stages.

The first auto trip over the Myrtle Point road was made last Summer by A. H. Stutsman, of Marshfield, the principal town of the bay group. He went to Roseburg and back, and at once began agitating for an automobile thoroughfare to the Southern Pacific, for he declared there were no obstacles which could not easily be overcome. Henry Harth, of Roseburg, took a party of friends over the road a little later.

Crossing the Coast Range of mountains, this road, and the so called Coos Bay route as well, afford the man who seeks something new in scenery many opportunities to gratifying his view-loving senses. The incline is 12 miles up one side of the range and four miles down the other side, and every rod of the distance is worth traveling for its scenic beauties. The summit is 3,000 feet above the level of the Pacific. Mr. Harth, among others, prefers the Coos Bay route.

First Auto Through Devil's Gate, Coos Bay, Oregon.

EFFORTS TOWARDS UNIFORM AUTOMOBILE LAW

THE desirability of a uniform automobile law is generally recognized and any effort in this direction seems assured in advance to meet the unanimous support of a large majority of automobilists. Governor Hughes, in his annual message to the New York State Legislature, recommended the adoption by New York and neighboring States of a uniform motor vehicle law, and suggested that the work could be properly done within the purview of the duties of the Commissioners on Uniform State Laws.

Pursuant to the suggestion of Governor Hughes, the Commissioners on Uniform State Laws of New York, New Jersey and Connecticut were invited to a conference, which was of considerable duration, the various diversities at present existing in the laws of the States were discussed and plans laid for the elimination of the differences as far as might be. The conference requested that Charles Thaddeus Terry, who is one of the commissioners from New York and also chairman of the A. A. A. Legislative Board, draft a proposed uniform act to form the basis for the deliberations of the conference. This has now been done. The draft has been printed, and copies have been distributed among the commissioners of the States in question.

The next meeting of the conference will be held in New York City on Saturday of this week, when it is anticipated that the final form of the bill to be recommended to the several legislatures will be decided upon. Suggestions with reference to and criticisms of the bill are invited and will receive the attention of the conference. The matter being one of such vital interest to all concerned, it has been deemed advisable to print in full the following draft of the proposed law:

AN ACT

PROVIDING FOR THE REGISTRATION, IDENTIFICATION AND REGULATION OF MOTOR VEHICLES OPERATED UPON THE PUBLIC HIGHWAYS OF THIS STATE, AND OF THE OPERATORS OF SUCH VEHICLES; AND PROVIDING A FUND FOR THE MAINTENANCE AND IMPROVEMENT OF THE PUBLIC HIGHWAYS OF THIS STATE.

The People of the State of..... represented in Senate and Assembly, Do Enact as follows:

Section 1. Definitions.—The Term "motor vehicle" as used in this act, except where otherwise expressly provided, shall include all vehicles propelled by any power other than muscular power, except motor-bicycles, motor-cycles, traction engines, road rollers, fire wagons, engines, police patrol wagons, ambulances and such vehicles as run only upon rails or tracks. The term "local authorities" shall include all officers of counties, cities, boroughs, towns or villages, as well as all boards, committees and other public officials of such counties, cities, boroughs, towns or villages. The term "chauffeur" shall mean any person operating a motor vehicle for hire, or as the employee of the owner thereof. The term "state" as used in this act, except where otherwise expressly provided, shall also include the territories and the federal districts of the United States. The term "owner" shall also include any person, firm, association or corporation renting a motor vehicle or having the exclusive use thereof, under a lease or otherwise, for a period greater than thirty days. The term "public highway" shall include any highway, county road, state road, public street, avenue, alley, park, parkway or public place in any county, city, borough, town or village, except any speedway which may have been or may be expressly set apart by law for the exclusive use of horses and light carriages.

Sec. 2. Subdivision 1. Registration of Motor Vehicles.—Every owner of a motor vehicle which shall be operated or driven upon the public highways of this state, shall, for each motor vehicle owned, except as herein otherwise expressly provided, cause to be filed, by mail or otherwise, in the office of the secretary of state s verified application for registration on a blank to be furnished by the secretary of state for that purpose, containing: (1) A briel description of the motor vehicle to be registered, including the name of the manufacturer, the style, type and factory number of such vehicle, the character of the motor power and the amount of such motor power stated in figures of horsepower. (2) The name, residence and business address of the owner of such motor vehicle and the name of the county in which he resides; provided that if such motor vehicle is used or to be used solely for commercial purposes, or, if propelled by electric battery power, is used or to be used solely within the confines of a city, the applicant shall so certify.

Subd. 2. Registration Book.—Upon the receipt of an application for registration of a motor vehicle or vehicles as provided in this section and in section four of this act, the secretary of state shall file such application in his office and register such motor vehicle or vehicles with the name, residence and business address of the owner, manufacturer or dealer as the case may be, together with the facts stated in such application, in a book or index to be kept for the purpoee, under the distinctive number assigned to such motor vehicle by the secretary of state, which book or index shall be open to inspection during reasonable business hours.

Subd. 3. Certificate of Registration.—Upon the filing of such application and the payment of the fee provided in subdivision six of this section, the secretary of state shall assign to such motor vehicle a distinctive number, and, without expense to the applicant, issue and deliver to the owner a certificate of registration, in duplicate, in the form and size provided in subdivision three hereof. In the event of the loss, mutilation or destruction of a certificate of registration, the owner of a registered motor vehicle may obtain from the secretary of state a duplicate thereof, upon filing in the office of the secretary of state an affidavit showing the fact and the payment of a fee of one dollar for each duplicate.

Subd. 4. Registration Lists to be Furnished County Clerks.—The secretary of state shall, within sixty days after this act takes effect, and thereafter, on or before the first day of February of each year, furnish to the clerk of every county in the state a full and accurate list of all motor vehicles so registered, stating the distinctive numbers so assigned to them and the names, residences and business addresses of the owners, manufacturers or dealers, as the case may be, and once each month thereafter a similar list of the additional registrations, which additional list shall be entered by each county clerk upon the original list received by him. Such lists shall be filed by such county clerks and be kept as public records, open to inspection during reasonable business hours.

Subd. 5. Re-registration Annually.—Such registration shall be renewed annually in the same manner and upon the payment of the same fee as provided in this section for original registration. Such renewal to take effect on the first day of January of each year.

Subd. 6. Registration Fees.—The following fees shall be paid to the secretary of state upon the registration of a motor vehicle in accordance with the provisions of this act: Three dollars upon the registration of a motor vehicle having a rating of less than twenty horsepower; five dollars upon the registration of a motor vehicle having a rating of twenty horsepower and less than thirty horsepower, and ten dollars upon the registration of a motor vehicle having a rating of thirty horsepower or more; and if a motor vehicle has two ratings of horsepower, the registration fee shall be based on the higher rating; provided that the owner of any motor vehicle which has been registered under existing law subsequent to the.....day of..... one thousand nine hundred and.....shall be entitled to a credit or rebate of the fees paid under such law for such registration; and provided further that for motor vehicles which in the verified application for registration are stated to be used solely for commercial purposes, or, if propelled by electric battery power, to be used solely within the confines of a city, the fee for such registration shall be five dollars.

Subd. 7. Sale and Registration by Vendee.—Upon the sale of a motor vehicle registered in accordance with this section, the vendee shall, within ten days after the date of such sale, notify the secretary of state of the same upon a blank furnished by him for that purpose, stating the name and business address of the previous owner, if known, the number under which such motor vehicle is registered and the name, residence and business address of such vendee. Upon filing such statement such vendee shall pay to the secretary of state a fee of one dollar, and upon receipt of such statement and fee the secretary of state shall file such statement in his office and note upon the registration book or index such change in ownership, and at least monthly notify every county clerk of the state of such sales, each of whom shall immediately note the same on the list of registered vehicles received and kept on file by him as herein provided.

Subd. 8. Fees in Lieu of Taxes.—The registration fees imposed by this act upon motor vehicles other than those of manufacturers and dealers and those used solely for commercial purposes, shall be in lieu of all other taxes, general or local, to which motor vehicles may be subjected as personal property under the laws of this state.

Sec. 3. Subd. 1. Distinctive Number Must Be Carried on Motor Vehicles.—No person shall operate or drive a motor vehicle on the public highways of this state after the.....day of....., nineteen hundred and....., unless such vehicle shall have the certificates of registration assigned to it by the secretary of state conspicuously displayed, one on the front and one on the rear of such vehicle, each securely fastened so as to prevent the same from swinging, provided that the owners of motor vehicles registered and assigned numbers under any law in force at the time this act takes effect, shall continue to display such numbers thereon until the.....day of....., nineteen hundred and..... No person shall display on such vehicle at the same time any number assigned to it under any other motor vehicle law or ordinace.

Subd. 2. Color of Number Plate to Be Changed Annually.—Such certificates of registration shall be of a distinctly different color or shade each year, to be designated and selected by the secretary of state, and there shall be at all times a marked contrast between the color of the number plates and that of the numerals or letters thereon.

Subd. 3. Form of Certificate.—Such certificate of registration shall be an enameled plate or placard of metal, four and one-half inches wide and not more than twelve inches in length, in the upper left hand corner of which there shall be a fac-simile of the seal of the state, underneath which there shall be the initials " ," and to the right of which seal and initials there shall be the distinctive number assigned to the vehicle set forth in numerals three inches long, each stroke of which shall be at least one-half an inch in width; provided that in the case of a motor vehicle registered under section four of this act there shall be on such plate or placard in addition to the foregoing the letter "M," the same to be at the right of the distinctive number, each stroke of such letter to be at least three inches long and one-half an inch in width.

Sec. 4. Subdivision 1. Registration by Manufacturers and Dealers.—Every person, firm, association or corporation manufacturing or dealing in motor vehicles may, instead of registering each motor vehicle so manufactured or dealt in, make a verified application upon a blank to be furnished by the secretary of state for a general distinctive number for all the motor vehicles owned or controlled by such manufacturer or dealer, such application to contain: (1) a brief description of each style or type of motor vehicle manufactured or dealt in by such manufacturer or dealer, including the character of the motor power, the amount of such motor power stated in figures of horsepower, and the weight in pounds of each such style or type; and (2) the name, residence and business address of such manufacturer or dealer. On the payment of a registration fee of ten dollars, such application shall be filed and registered in the office of the secretary of state in the manner provided in section two of this act. There shall thereupon be assigned and issued to such manufacturer or dealer a general distinctive number and duplicate certificates of registration in the manner provided by section two, which shall be in the form of plates as provided in section three, duplicates of which shall be carried or displayed by every motor vehicle of such manufacturer or dealer, so registered when the same is driven or operated on the public highways. Such manufacturer or dealer may obtain as many duplicates of such certificates of registration as may be desired upon payment to the secretary of state of one dollar for each duplicate. Nothing in this subdivision shall be construed to apply to a motor vehicle operated by a manufacturer or dealer for private use or for hire.

Subd. 2. Re-registration Annually.—Such registration shall be renewed annually in the same manner upon the payment of a fee of ten dollars, such renewal to take effect on the first day of January of each year.

Sec. 5. Exemption of Non-resident Owners.—The provisions of the foregoing sections shall not apply to a motor vehicle owned by a non-resident of this state, provided that the owner thereof shall have complied with the provisions of the law of the state of his residence relative to motor vehicles and the operation thereof and shall conspicuously display his state number, and provided further that the provisions of the foregoing sections of this act are substantially in force in such state; provided that this exemption shall not apply to non-resident corporations doing business in this state.

Sec. 6. Subd. 1. Brakes, Horns, Lamps, et cetera.—Every motor vehicle, operated and driven upon the public highways of this state, shall be provided with adequate brakes sufficient to control the vehicle at all times, and a suitable and adequate bell, horn or other device for signaling, and shall, during the period from one hour after sunset to one hour before sunrise, display at least two lighted lamps on the front and one on the rear of such vehicle, which shall also display a red light visible from the rear. The white rays of such rear lamp shall shine upon the number plate carried on the rear of such vehicle. The light of the front lamps shall be visible at least two hundred feet in the direction in which the motor vehicle is proceeding.

Subd. 2. Use of Non-skidding Devices.—No person shall operate or drive on the public highways of this state a motor vehicle on any of whose wheels is a tire chain or non-skidding contrivance or tire composed in whole or in part of metal, except when such highways are wet and slippery or covered with ice or snow.

Subd. 3. Stopping on Signal.—A person operating a motor vehicle shall, at request or on signal by putting up the hand, from a person riding, leading or driving a horse or horses or other draft animals, bring such motor vehicle immediately to a stop, and, if traveling in the opposite direction, remain stationary, so long as may be reasonable to allow such horse or animal to pass, and, if traveling in the same direction, use reasonable caution in thereafter passing such horse or animal; provided that, in case such horse or animal appears badly frightened or the person operating such motor vehicle is requested so to do, such person shall cause the motor of such vehicle to cease running so long as it shall be reasonably necessary to prevent accident and insure the safety of others.

Sec. 7. Speed Permitted.—No person shall operate a motor vehicle upon the public highways of this state recklessly or at a rate of speed greater than is reasonable and proper having regard to the width, traffic and use of the highway, or so as to endanger property, or the life or limb of any person.

Sec. 8. Subdivision 1. Registration of Chauffeurs.—Every person hereafter desiring to operate a motor vehicle as a chauffeur shall file in the office of the secretary of state, upon the payment of a registration fee of five dollars, a verified application for registration on a blank to be furnished by the secretary of state for that purpose containing (1) the name and residence address of the applicant and that he is competent to operate a motor vehicle and is over 18 years of age; (2) the trade name and motor power of the motor vehicle or vehicles he is competent to operate; (3) whether or not the applicant has been previously convicted of a violation of any of the provisions of this or any other motor vehicle law or ordinance, giving the date and place of such conviction and the provision or provisions of the law or ordinance violated; provided that if such chauffeur shall intend to operate only vehicles used solely for commercial purposes, he shall so certify in such application and shall pay a registration fee of two dollars.

Subd. 2. Chauffeur's Registration Book; List to Be Furnished County Clerks.—Upon the receipt of such an application, the secretary of state shall thereupon file the same in his office, assign the applicant a number and register him in a book or index which shall be kept in the same manner as the book or index for the registration of motor vehicles. The secretary of state shall also furnish to the clerk of every county of the state within sixty days after this act takes effect and once each month thereafter, a full and accurate list of chauffeurs so registered, with their addresses and the numbers assigned to each, in the same manner as provided in section two with reference to registered motor vehicles. Such lists shall be filed by such county clerks and be kept as public records, open to inspection during reasonable business hours.

Subd. 3. Chauffeur's Badge.—The secretary of state shall forthwith upon registering such chauffeur, and without other fee, issue and deliver to him a badge of aluminum or other suitable metal, which shall be oval in form with its greater diameter not more than two inches, upon which shall be stamped the words "Registered Chauffeur Number .....; State of ....." with the number inserted therein. This badge shall thereafter be worn by such chauffeur, pinned upon his clothing in a conspicuous place, at all times while he is operating a motor vehicle upon the public highways of this state. In the event of the loss, mutilation or destruction of a chauffeur's badge, such chauffeur may obtain from the secretary of state a duplicate thereof upon filing in the office of the secretary of state an affidavit showing the fact and the payment of a fee of one dollar.

Subd. 4. Fictitious Badge.—No chauffeur, having registered as hereinbefore provided, shall voluntarily permit any other person to wear his badge; nor shall any person, while operating a motor vehicle upon the public highways of this state, wear a chauffeur's badge belonging to another person, or a fictitious chauffeur's badge.

Subd. 5. Unregistered Chauffeurs Cannot Drive Motor Vehicles.—No person shall operate or drive a motor vehicle as a chauffeur, upon the public highways of this state after thirty days after this act takes effect, unless such person shall have complied in all respects with the requirement of this section, provided, however, that a non-resident chauffeur, who has registered under the provisions of the law of the state of his residence which are substantially similar to the provisions of this section, shall be exempt from registration under this section; and provided further

he shall wear the badge assigned to him in the state of his residence in the manner provided in subdivision three of this section.

Sec. 9. Local Ordinances Prohibited.—Except as herein otherwise provided, local authorities shall have no power to pass, enforce or maintain any ordinance, rule or regulation requiring from any owner or chauffeur to whom this act is applicable, any tax, license or permit for the use of the public highways, or excluding any such owner or chauffeur from the free use of such public highways, or in any other way respecting motor vehicles or their speed upon or use of the public highways; and no ordinance, rule or regulation contrary to the provisions of this act, now in force or hereafter enacted, shall have any effect; provided however, that the powers given to local authorities to regulate vehicles offered to the public for hire, and processions, assemblages, or parades in the streets or public places, and all ordinances, rules and regulations which may have been, or which may be enacted in pursuance of such powers shall remain in full force and effect; and, provided, further, that local authorities may set aside for a given time a specified public highway for speed contests or races, to be conducted under proper restrictions for the safety of the public, and provided further, that local authorities may exclude motor vehicles from any cemetery or grounds used for the burial of the dead.

Sec. 10. Subdivision 1. Penalty for Violations of Sections Two, Three, Four, Five and Six.—The violation of any of the provisions of sections two, three, four, five and six of this act shall be punishable by a fine not exceeding fifty dollars.

Subd. 2. Penalty for Violations of Section Seven.—The violation of any of the provisions of section seven of this act shall be deemed a misdemeanor punishable by a fine not exceeding two hundred and fifty dollars for a first offense and by a fine not exceeding five hundred dollars or imprisonment for not more than six months or both for a second or subsequent offense; but nothing herein shall prevent the indictment of a person so violating under any other law.

Subd. 3. Penalties for Violations of Section Eight.—The violation of any of the provisions of section eight of this act shall be punishable by a fine not exceeding fifty dollars or the suspension of the right to operate a motor vehicle as a registered chauffeur under the provisions of this act for a period not more than six months.

Subd. 4. Penalty for Tampering With or Using a Motor Vehicle Without Permission.—Any person using, operating, driving or tampering with a motor vehicle without the permission of the owner of such motor vehicle is guilty of a misdemeanor punishable by a fine not exceeding five hundred dollars and imprisonment for not more than six months, or both.

Subd. 5. Certifying Convictions to the Secretary of State.—Upon the conviction of any person for a violation of any of the provisions of this act, the magistrate, or other judicial officer before whom the proceedings are held, shall immediately certify the facts of the case, including the name and address of the offender, the character of the punishment and the amount of any fine imposed and paid, to the secretary of state, who shall enter the same either in the book or index of registered motor vehicles or in the book or index of registered chauffeurs as the case may be, opposite the name of the person so convicted, and in the case of any other person, in a book or index of offenders to be kept for such purpose, in alphabetical order. The secretary of state shall send notices of all convictions for violations of section seven of this act, with the names and addresses of the persons convicted and the judgments of the court on such convictions, to the clerk of every county in the state, who shall enter the same on the lists of registered motor vehicles or registered chauffeurs as the case may be, opposite the name of the person so convicted, or on a list of other offenders which he shall maintain in his office as a public record in the same manner as the lists of registered motor vehicles and registered chauffeurs, and on due application furnish copies of such lists to the magistrates or other judicial officers of his county before whom violations of the provisions of this act are triable. If any such convictions shall be reversed upon appeal therefrom, the person whose conviction has been so reversed may serve on the secretary of state a certified copy of the order of reversal, whereupon the secretary of state shall enter the same in the proper book or index in connection with the record of such conviction, and shall also notify each county clerk of the same.

Subd. 6. Release from Custody, Bail, et cetera.—In case any person shall be taken into custody because of a violation of any of the provisions of this act, he shall forthwith be taken before the nearest magistrate or justice of the peace in any city, village or county, or before any accessible captain, sergeant of police or acting captain or sergeant of police who shall have the powers of a magistrate or justice of the peace, and be entitled to an immediate hearing; and if such hearing cannot then be had, be released from custody on giving a bond or undertaking executed by a fidelity or surety company authorized to do business in this state, such bond or undertaking to be in an amount not exceeding two hundred and fifty dollars for his appearance to answer for such violation at such time and place as shall then be indicated, or on giving his personal undertaking to appear to answer for such violation at such time and place as shall then be indicated, secured by the deposit of a sum not exceeding two hundred and fifty dollars, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehicle with a written consent given at the time by the owner who must be present, with such judicial officer; or in case such judicial officer is not accessible be forthwith released from custody on giving his name and address to the person making the arrest and depositing with such arresting officer the sum of two hundred and fifty dollars, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehicle with a written consent given at the time, by the owner, who must be present; provided that in such case, the officer making the arrest shall give a receipt in writing for such sum or vehicle deposited, and notify such person to appear before the most accessible magistrate, naming him, and specifying the place and the hour. In case such bond or undertaking shall not be given, or deposit made by an owner, or other person taken into custody, the provisions of law in reference to bail in cases of misdemeanor shall apply.

Subd. 7. Holding Defendant to Answer Where Magistrate Has Not Jurisdiction to Try Offender; Admitting to Bail.—In case the magistrate before whom any person shall be taken, charged with the violation of any provision of this act, shall not have jurisdiction to try the defendant, but shall hold the defendant to answer as provided by.....of the ....., he shall admit such defendant to bail upon his giving a surety company's bond or undertaking to appear to answer for such violation at such time and place as shall then be indicated, or upon his giving his written undertaking in the form provided in ..... of the ..... in a sum equal to the maximum fine for the offense with which he is charged, or upon depositing such amount in cash with such magistrate who shall give a receipt in writing for such sum.

Subd. 8. Return of Bail.—Upon the person who has been taken into custody and given security or bail for his appearance presenting himself for trial, the judicial officer before whom such person is to be tried, shall, before the beginning of such trial, return to the person about to be tried, the property or money given as security or bail.

Sec. 11. Subdivision 1. Registration Fees to Be Paid Into State Treasury.—The registration fees provided herein shall be paid by the secretary of state into the state treasury. The legislature shall annually make appropriations of an amount sufficient to pay all proper expenses of this act.

Subd. 2. Certain Fines and Penalties; to Whom Paid.—All fines, penalties or forfeitures imposed or collected for a violation of any of the provisions of this act, or of any act in relation to the use of the public highways by motor vehicles now in force or hereafter passed, which are imposed or collected under the sentence or judgment of a court of special sessions, held or presided over by a justice of the peace, shall be paid over by such justice of the peace within ten days after receipt thereof to the treasurer of the state, with a statement accompanying the same, setting forth the action or proceeding in which such moneys were collected, the name and residence of the defendant, the nature of the offense and the fine, penalty or sentence imposed. On the first day of each month, or within ten days thereafter, such justice of the peace shall make and forward to the treasurer of the state a verified report of all criminal proceedings instituted or tried before him during the preceding calendar month for violations of any of the provisions of this act, or of any act in relation to the use of the public highways by motor vehicles, which report shall set forth the name and address of the defendants, the nature of the offenses and the fines and penalties collected or imposed by such justice; which reports shall be public records and open to inspection during reasonable business hours.

Subd. 3. Registration Fees and Fines to Be Used for the Maintenance of Public Highways.—All moneys paid into the state treasury pursuant to this act, except such as shall be appropriated under subdivision one of this section, shall there be maintained as a separate fund for the maintenance and repair of the improved roads of this state.

Sec. 12. Acts Repealed.—All acts or parts of acts inconsistent herewith or contrary hereto are hereby expressly repealed.

Sec. 13. Title of Act and When it Takes Effect.—This act shall be known as the "Motor Vehicle Law" and shall take effect the first day of ....., nineteen hundred and .....; provided that applications for registration may be made and registration certificates and badges issued at any time within thirty days prior to such date.

SHOWS WITH LESSER TRAPPINGS.

At this time of the year, after the closing of the second big show and just prior to the opening of the next one, a consideration of the show question is particularly appropriate. This is a question that has aroused much discussion and more comment abroad, particularly in France, where the need for financial retrenchment was more necessary. No solution has been reached, and in the meantime the shows will continue to be held, but on a more quiet, less expensive and more sane basis.

After it is all said and done, what does this elaborate display of mirrors, bunting, myriads of electric lights, bright fresh paint, and other show paraphernalia add to the real merit of the car? What do all these trappings help in the way of a better-running, longer-lived engine, a simpler transmission, a better frame, or a more suitable body? To answer this question is to answer, nothing, nothing at all! So then we are forced to the unwelcome but logical conclusion that money is spent in very large amounts for no useful purpose. Therefore, in time, it must cease, for the public, throwing the cold clear light of reason upon it, can only arrive at the same conclusion, that it is mostly useless and must go.

But in bringing manufacturer, selling agent, and buyer together for mutual benefits, the show serves some purpose. The objections, then, are founded only upon the basis of needless expenditures. Remove these and the objections are removed. What will be left then? The show of the future, robbed of all glitter and glamour, separated from all idea of display, simply a clean, clear exposition of the merits of the various products in the least expensive way. This then is the simple and sane show which manufacturers, sales agents, and buyers will welcome equally, for all will profit by it. Of course there should be some relieving of the monotony of an undecorated amphitheater, but now 'tis too elaborate for the necessities of the occasion.

* * *

THE CONTROL OF SPEED RACING.

It would appear that some of the manufacturers and importers still believe in the advertising value of high-speed automobile racing. It would also seem possible that the A. A. A. in relegating this branch of competition to such a secondary position as it has may have taken action which was slightly premature, in view of the unquestioned demand for a fairly liberal continuance, for at least another year, of speed contests. If upon a resurvey of the situation evidence is plentiful to the effect that high-speed competition still requires a considerable amount of attention, it is a matter of wisdom that the A. A. A. should again place this form of the sport in the hands of a board giving it entire attention. But at the same time this board could well be one composed for the most part of manufacturers interested in racing, and this board might also be given authority to select its own chairman and secretary. Make membership on it open to any manufacturer who would agree in advance to compete in one or more of the year's big events.

In order to convince the public that the acts of this board were subject to amendment, and, if necessary, annulment, a disinterested board of appeals could be established, for the purpose of passing upon any complaints that may arise in the conduct of the sport.

There is no logical reason whatever for any "war" over the control of the sport, for such a proceeding will be detrimental all around, and this would prove as disastrous as it would be costly and utterly unnecessary. There must be government, and racing should be one of the A. A. A. departments, even though it might be conducted on different lines in the future than in the past. Conditions change, and unquestionably conditions have changed in relation to high-speed racing. Common sense and a get-together program should be the outcome.

* * *

THE CALL FOR UNIFORM AUTO LAWS.

What seems to be a promising beginning in the direction of uniform automobile laws has been made through the instrumentality of Governor Hughes of New York State, which beginning is told in this issue in the presentation on another page of the first draft of a law prepared and being considered by the Commissioners on Uniform State Laws of New York, New Jersey and Connecticut. While this measure may be more or less modified before it finds permanent lodgment on the statute books, the chances are not unlikely that in slightly revised form it will become a reality in the States mentioned and in other commonwealths where there is a desire to treat fairly with those automobilists who are deserving of just consideration in the framing of the law.

THE SENATE OF A GREAT COUNTRY!

WASHINGTON, D. C., Jan. 24.—Because the item read "for the purchase of a horse and carriage, *or other vehicle*," the United States Senate has refused to sanction an appropriation for furnishing the Speaker of the House of Representatives with carriage service during his official term. In rejecting the item several senators got into a very heated argument about automobiles, Senator Bailey, of Texas, and Senator Bacon, of Georgia, being particularly caustic in their arraignment of the automobile, while Senator Warren, of Wyoming, warmly commended it. Senator Warren called attention to the fact that on his big ranch in Wyoming automobiles were almost indispensable in rounding up lost cattle, and because of their speed and adaptability they were far superior to horses for this purpose

Senator Bailey tearfully told the Senate that the automobile was an abomination and that its use on the public highways should be curtailed, if not abolished. The introduction of automobiles into the government service, he said, made it appear that the government was trying to drive the horse, one of the farmer's mainstays, out of business. Senator Warren responded to this by saying that while the use of automobiles was daily increasing by leaps and bounds, the prices of horses in the market had not been lowered.

Senator Bacon, while agreeing with everything his Texas colleague had said about the automobile, stated that Congress should not stand in the way of progress. The automobile, he said, had apparently come to stay, and while he was opposed to them on general principles, still if they were found efficient the government should adopt them wherever practicable.

The appropriation was finally voted down on the ground that it was unwise to provide government officials with vehicles at the public expense. It should be understood that this does not apply in the case of the President of the United States, to whom is given an appropriation every year of $25,000 for the purchase of horses and the maintenance of the White House stables.

While this debate was in progress in the Senate, the House was devoting some time to the consideration of the item of $12,000 in the urgent deficiency bill for the purchase and maintenance of two automobiles for President-elect Taft. Chairman Tawney, of the Appropriation Committee, informed the House that the item was included in the bill at the express wish of Judge Taft, who desired to replace the White House horses and carriages with the more modern mode of locomotion. Recognizing the utility of the automobile, the House passed the item without question. The Senate Committee on Appropriations, however, killed the item in reporting the bill to the Senate. There is reason to believe, however, that a way will eventually be found to enable Judge Taft to carry out his pet idea of having the automobile as the official White House conveyance.

MOTOR SPEEDWAY WILL BE BUILT.

INDIANAPOLIS, IND., Jan. 25.—Plans for the motor speedway have been completed and construction will start February 15 with the understanding that it is to be completed by May 15. It is the intention to hold the first events on the track some time in June. The outer track is to be oval and will be two miles in circumference with loops winding toward the center, making the whole track five miles long. It will be twenty-five feet wide except at the turns, where it will be thirty-five feet wide, well banked, to allow high speed.

To build the track and promote events the Indianapolis Motor Speedway Co. has been organized with $200,000 capital, with the following officers: President, Carl G. Fisher, president of the Prest-O-Lite Company and treasurer of the Fisher Automobile Co.; vice-president, A. C. Newby, secretary and treasurer of the National Motor Vehicle Co.; second vice-president, F. H. Wheeler, of Wheeler & Schebler, carbureter manufacturers; and secretary and treasurer, James A. Allison, secretary-treasurer of the Prest-O-Lite Company. It is understood that men prominent in automobile circles over the country have subscribed for the stock.

The company has purchased 320 acres of land on a flat plateau about three miles northwest of the center of the city.

LATEST IDEAS CONCERNING BRIARCLIFF.

IN deciding upon the rules for a stock chassis race difficulties are always encountered, and it appears that the Manufacturers' Contest Committee is having the usual trouble in trying to formulate regulations for the holding of the Briarcliff Trophy race that will be generally satisfactory. Three meetings have now been held in the course of six weeks, and three radically different sets of rules have been promulgated, the last practically reverting to the original regulations under which the race was run in the Spring of 1908, with the very important difference, however, that it is proposed to eliminate the stock chassis feature altogether. The last meeting was held at the A. C. A. on Monday of the present week and resulted in the increase of the bore limit to 5 3-4 inches, which is the equivalent of last year's limitation that the total piston area of a four-cylinder motor should not exceed 103.87 square inches. But coincident with this concession to those prospective entrants who built large motors for last year's event, all restrictions on the stroke and weight have been done away with, placing the contest on exactly the same plane as the Vanderbilt race or the Grand Prize of the A. C. A. and entirely eliminating its stock features. These changes, however, are subject to the approval of the donor of the cup, W. W. Law, and they will be submitted to him before being officially adopted.

That the stock car idea was not killed without at least one defender rising in the attempt to save it, is evident from the protest of George H. Strout, representing the Apperson interests at Monday's meeting. While the fact that the Apperson Brothers Company had already gone to the expense of making patterns conforming to the rules previously adopted would not cause them to lose interest in the race, even though the new rules made the patterns worthless, Mr. Strout strongly contended that the engine should be such as to permit the manufacturer to turn it to some commercial use as a type for the following year. The day of the motor with a 5 3-4-inch bore and an exaggerated stroke, as a stock proposition, was past, asserted Mr. Strout, and he accordingly tried to have the conditions fixed so as to place a limit on the stroke, or to have a piston displacement limit set that would not permit engines with a stroke greater than 6 inches. He was, however, overruled on both points. This naturally carries with it the elision of the "ten similar cars" clause of last year's regulations.

QUAKERS DON'T LIKE THE DECISION.

PHILADELPHIA, Jan. 25.—Basing its decision on the absence of any rule governing the case in the conditions of the Quaker City Motor Club's New Year's endurance run, and on the claim that permission to unload passengers in slippery places where traction could not be obtained had been verbally granted by one of the club officials, Chairman Frank B. Hower, of the A. A. A. Contest Committee, to-day sent a communication to President P. D Folwell, of the Q. C. M. C., sustaining the protests of the entrants of Premier car (No. 21), Ray MacNamara driver, which had been disqualified for disembarking its passengers in the effort to reach the top of ice-covered Grant's Despair on the second day of the contest.

As a result of the recognition of the Premier claims the Quakers are fighting mad. They say the A. A. A. has no organized set of rules governing endurance runs, and in such absence the club formulated a set of rules of its own which the contestants were bound to live up to, and that the A. A. A. had, therefore, no jurisdiction in the matter; that even with its disqualification removed, the Premier can finish no higher than fourth place, owing to its accumulation of checkers' and observers' penalties; that the Matheson people have the cup and will doubtless keep it; and, finally, that if necessary to the upholding of its right to formulate and carry out its own rules (in the absence of any national regulations) it shall be found advisable to break away from the A. A. A., the club may even resort to such an extreme measure rather than stultify itself in the eyes of the motoring world. Meanwhile the Quakers have formally notified

Frederick H. Elliott, the A. A. A. secretary, that they are preparing an appeal to the national body's executive board, the basis of which will be that Chairman Hower's committee has no jurisdiction in the matter.

W. K. VANDERBILT, JR., GOES TO EUROPE.

William K. Vanderbilt, Jr., donor of the famous cup and president of the Long Island Motor Parkway, sailed for Europe on Saturday last for a more or less extended vacation abroad. While various rumors have been current anent the recent Vanderbilt Cup race, the latest news is to the effect that the bills in connection with that affair are now being taken care of by the Parkway Company, which in reality assumed the obligations in connection with the race. This came about because the Nassau County authorities refused to accept any bond except that of the Parkway Company, which owned real estate in the county.

The Parkway plans for the future seem to be somewhat in doubt, but the indications are that ultimately work will be resumed. Nothing can be prophesied at this time as to any 1909 race for the Vanderbilt Cup, but it is hardly probable that this famous trophy will be allowed to drop out of sight.

FLORIDA BEACH RACES, MARCH 23 TO 26.

According to "Senator" W. J. Morgan, who has been connected with the Florida race meets for some years and will again manage this year's meeting, the indications are that March 23 to 26, inclusive, will see a successful program of events. F. D. Stidham, who is in Florida looking over the ground, has wired that the Florida East Coast Automobile Association has succeeded in raising sufficient money to insure the success of the meet. The name of Charles G. Burgoyne, of New York, has been added to the list of contributors with a donation of $500, and this, together with the other offers of prizes, either in the form of money or plate, makes certain that each event will be worth competing for. The majority of the races will be for short distances, with the exception of the 100-mile race for the $2,000 Minneapolis cup and the 200-mile stock car event, with $1,000 in cash prizes, as well as the trophy.

EFFORTS TO FORM NEW RACING BODY.

During the Garden show several meetings were held by representatives of several American firms and importers, looking forward to the formation of a new body to look after high speed racing participated in by those represented. Nothing definite seems to have been decided upon, but another meeting is called to take place during the Chicago show, at which time something more tangible, it is asserted, will be forthcoming. The situation is somewhat confusing, some believing that the A. A. A. has made a mistake in involving high speed racing with touring and other similar contests, while others contend that this arrangement should be tried at least for the present year. Indications are that those who supply the entries are inclined to have something to say in the conduct of this branch of the sport.

HART O. BERG ARRIVES IN AMERICA.

Hart O. Berg, business partner of the Wright Brothers, arrived Tuesday on the *Kaiser Wilhelm der Grosse*. He is most enthusiastic about the aeroplane outlook abroad, and states that the Wright brothers have made an unqualified success.

It is not probable that Wilbur Wright will compete in the Monaco aeroplane races. He hopes to conclude his present work in Southern France in time to return to America early in June.

SUIT SETTLED OUT OF COURT.

HARTFORD, CONN., Jan. 25.—The suit of L. D. Parker against the Hartford Rubber Company has been settled out of court. The suit involved a five-year contract and letters patent, with salary figures of $35,000 a year.

TIRE COMPANIES HOLD MEETINGS.

AKRON, O., Jan. 23.—At the annual meeting of the B. F. Goodrich Company the old board of directors and officers were elected. The directors are George W. Crouse, George T. Perkins, B. G. Work, Frank H. Mason, Elmer Shaw, C. C. Goodrich, and H. E. Raymond. The officers chosen by the directors are as follows: President, B. G. Work; chairman of the board of directors, Col. George T. Perkins; first vice-president, Frank H. Mason; second vice-president, H. E. Raymond; secretary, Charles B. Raymond; treasurer, W. A. Folger. The reports of the officers showed one of the best years in the company's business, and an especial growth in the automobile tire department. Big additions to the plant are being made. One of the changes in the managerial department is that of W. E. Hemenover being made assistant general superintendent to succeed H. E. Joy, who was advanced to succeed C. C. Goodrich, resigned, as general superintendent. Hemenover is a comparatively new man in the plant, coming from St. Louis four years ago to be manager of the boot and shoe department.

At the annual meeting of the Swinehart Tire & Rubber Company the following directors were elected: J. A. Swinehart, B. C. Swinehart, C. O. Baughman, J. W. Rock, W. S. Frank and M. S. Rudgers. The directors elected officers as follows: President, J. A. Swinehart; vice-president, B. C. Swinehart; secretary and treasurer, C. O. Baughman. According to reports of the officers, the output of the plant will be doubled this year, although no definite action was taken at the meeting to increase the capacity of the plant.

The annual meeting of the Mansfield Rubber Company, which is just starting a plant to manufacture tires and casings, resulted in the stockholders naming F. A. Wilcox, C. H. Walters, L. Hautzenroeder, H. Homberger, F. M. Bushnell, and W. H. Bissman as directors. F. A. Wilcox was elected president and general manager; C. H. Walters, vice-president and superintendent; F. C. Walters, secretary; F. M. Bushnell, treasurer. The business being booked indicates that the plant will be kept busy from the start. Already three car loads of machinery have been installed, and the plant is expected to start by March 1.

THE AUTOMOBILE TRADE DIRECTORY.

For its first quarterly issue of 1909 "The Automobile Trade Directory" has a most complete list of all concerns interested in any way in the automobile industry, which means that the book is fat and prolific of facts. Its 500 pages, which is an increase of 60 pages over the previous issue, include a complete list of the manufacturers of all kinds of automobiles, motorcycles, motor boats, and parts and accessories; in fact, anything from a cotter pin to a complete chassis. There is also a complete list of all makers of machinery tools and equipment for factories, garages, and repair shops. The indices to these classifications require ten pages, two columns to the page, and covers some 2,000 articles. There are also 65 pages of valuable data and tables for engineers, which are alone worth the full price of the volume, including as they do all features of design of engines, clutches, bearings, and chains, together with such additional amplificatory material on weights and measures, physical properties of materials, wheel, tire, and rim dimensions as would be useful and necessary. "The Automobile Trade Directory" is issued by the Class Journal Company at 239 West Thirty-ninth Street, New York City.

CORBIN PLANT IS RUSHED WITH ORDERS.

NEW BRITAIN, CONN., Jan. 25.—An enormous demand for Corbin cars is reported by the Corbin Motor Vehicle Corporation, and in the near future the plant will have to begin running day and night in order to fill the orders which were booked before and during the recent Garden show. A large addition to the working force has been made, and it is stated that the motor vehicle department of the Corbin Corporation will be continued as heretofore, though various rumors have recently embodied statements to the contrary.

OREGON BUYING AUTOS, WANTS SHOW.

PORTLAND, ORE., Jan. 25.—Speaking of progress, some of the far Western cities have made such great strides in the past few years that they hardly dare to tell of it, for it will not be believed. Thus, Portland, which in 1900 had a population of 91,000, has to-day an increase of 200 per cent. to add to those figures. In the line of automobiles the increase has been more rapid than that, and the city hopes to have the greatest number of machines in relation to its population of any city in the United States. The figures on this are of absorbing interest to those interested in statistics.

Six years ago there were not more than 20 automobiles here. The following year this jumped to 45, an increase of 125 per cent. in one year. The year after that the good work was continued. a rise of 100 per cent. being chronicled. As another twelvemonth rolled around the figures chalked up were 227 per cent., 295 machines total; 1907 showed these at 600 machines, a trifling increase of 107 per cent, while the figures for the past year reach to 1,100. While this is only 83 per cent. more than 1907, it represents an increase over 1903 of no less than the stupendous total of 5,400 per cent.

So, with an increase in interest of that sort, an automobile show came next in order, and the first annual Automobile Show, given under the auspices of the Portland Automobile Club, will be held in the Armory from March 8 to 14. This show will be to the Pacific Northwest what the New York show is to the East and Chicago is to the Middle West.

A. C. OF PHILADELPHIA POSTING SIGNS.

PHILADELPHIA, Jan. 11.—Snow and ice do not curtail the activities of the Automobile Club of Philadelphia on its chosen line. During the month of December, 22 mileage and 11 direction signs were posted on the Philadelphia-Gettysburg route, and the Routes, Maps and Tours committee announces that it is preparing to publish the result of its last eighteen months' work in book form; these books will not only be distributed to members, but will be placed on sale for the benefit of the general motoring public. As they include data for all the well-traveled roads running out of Philadelphia, extending to Western Pennsylvania, New Jersey, and even as far as New England, these routes will prove valuable to the automobile tourist.

S. Boyer Davis, club counsel, is rounding up all A. C. of Philadelphia members, who have suffered from applications of Jersey justice during the past six months, hoping in this way to discover what has become of numerous fines which have been imposed by certain justices in that State, but which have as yet failed to reach the treasury at Trenton, as the law requires. The investigation will be pushed with vigor.

JERSEY CLUB DATE FOR ANNUAL BANQUET.

NEWARK, N. J., Jan. 25.—It has been decided by the special committee appointed to manage the annual banquet of the New Jersey Automobile and Motor Club, that the event shall be held in Krueger's Auditorium, Thursday evening, March 18. The committee of arrangements consists of H. D. Bowman, chairman; A. B. Le Massena, James R. English, W. C. Crosby, J. H. Wood, W. S. Sheppard, George Simonds, H. A. Bonnell, G. O. Groebe, C. W. Baker and Albert Schurr.

INTERESTING LECTURES AT THE A. C. A.

Following a special meeting of the club on Tuesday evening at the Automobile Club of America two interesting lectures were given, one by Roger B. Whitman, whose subject was, "The Magneto as a Source of Current for High Tension Ignition Systems," and the other by Henry Cave, who gave "A Demonstration of the Autogenous Welding as Applied to the Manufacture and Repair of Automobiles." The attendance was excellent.

POPE-TOLEDO TO BE APPERSON-TOLEDO.

TOLEDO, O., Jan. 25.—After many rumors to the effect that the plant of the Pope Motor Car Company had been sold to various purchasers, the announcement that it has been transferred to new owners is now made definitely. A syndicate of capitalists, headed by Richard D. Apperson, vice-president of the American National Bank, of Lynchburg, Va., has acquired control, and will shortly begin to operate the plant at its full capacity.

The company will be known as the Apperson-Toledo Motor Car Company, and its product will also be known as the Apperson-Toledo car, these changes in name being the only ones occasioned by the new management. The company has been operating on a reduced scale during the two years it has been in the hands of a receiver, and in that time Harold Pope, one of the receivers, has managed to liquidate a large part of the outstanding liabilities.

The similarity of names at first gave rise to the impression that the purchasers were the Apperson Brothers, of Kokomo, Ind., and that their intention was to consolidate the two plants. The new purchaser of the plant, however, cannot claim any relationship or connection with the pioneer automobile builders, and stated that the plant was not acquired with a view to any consolidation.

MAXWELL-BRISCOE MOTOR CLUB ORGANIZED.

Seldom has any automobiling organization come into existence with such an impressive list of charter members as that of the Maxwell-Briscoe Motor Club, for when the latter sprung into being as the result of the meeting held in connection with the annual reunion of Maxwell supporters at the Hotel Manhattan during the Palace show, the new club had no less than 349 members. The officers are:

President, H. A. Hover, Spokane, Wash.; first vice-president, Hon. P. T. Barlow, New York; second vice-president, J. D. Schofield, Dallas, Tex.; treasurer, H. B. Worthen, Brooklyn; secretary, Ernest Coler, New York. The directorate is composed of the foregoing officers, with Frank Bropst, New York, and Dr. F. J. Spargur, Cleveland, O.

There is also a woman's division, headed by Mrs. J. R. Ramsey. Hackensack, N. J.; first vice-president, Mrs. Lillian Gillespie, Poughkeepsie, N. Y.; second vice-president, Mrs. E. P. Gresh, Norristown, Pa.; secretary, Mrs. L. C. Norton, Highstown, N. J.

From the fact that the officers hail from all parts of the country, it will be seen that the club is to be truly national in its scope. Mr. Hover is soon to renew his round-the-world trip in a Maxwell car.

PREMIER MAKING MORE CENTURIES.

Not satisfied with its already creditable record of something like 15,000 miles, the Premier 100-Century car is again on the road between New York and Chicago, driven by Ray McNamara, with J. P. Slack in the other seat. This car with the same driver started its famous career during the Summer, when it competed in the Glidden contest and afterward continued to make at least 100 miles a day for 100 days, ending up with over 12,000 miles to the good. After passing a severe examination in Chicago for mechanical troubles, of which none was reported, the car has been on the road almost continuously ever since, making trips from city to city or taking part in various endurance contests. In December it was driven East and took part in the two days' endurance run of the Quaker City Motor Club from Philadelphia to Wilkes-Barre and return, finishing with a perfect mechanical score.

In order to be on hand for the opening of the Chicago show, opening next week Saturday, the car left Times Square Monday morning well prepared to battle with all sorts of road conditions. The company wishes to demonstrate that after going through the severest of tests to which this car has been put, and without any vital repairs of any sort, it is still in condition to make the trip to Chicago over the Winter roads.

A STRIKING EXAMPLE OF THE NEW FIRE WAGONS

ONE of the most noticeable, if not the most noticeable, feature of the commercial situation is that in respect to fire fighting apparatus. The progress made in the past few years in this line simply cannot be overstated. This progress is perhaps of two kinds, the actual or physical progress shown in the wagons actually put out into service, and the moral progress not so well shown; in fact, it might almost be said to be hidden. As the latter is the real cause of the former, it will be best to speak of it first of all.

Trying Out the Knox Hose Wagon on a New York City Dock, Foot of Gansevoort Street.

A few years ago the fire departments as a whole opposed the self-propelled wagons in every possible way, from the chiefs through the ranks down to the very lowest hostlers. Gradually through the involuntary progress of the pleasure cars in speed, refinement, capability, steadiness and reliability, but principally the last named, the firemen were won over. This movement gained in strength and spread upwards and outwards, until to-day all fire department men are enthusiastic in their praise of the work already done, and loud in their clamor for more and still more motor-propelled apparatus.

There have been a few companies awake to this movement, and they have carefuly catered to the existing demands, until a large business has been built up in this line. Foremost among these manufacturers has been the Knox Automobile Company, of Springfield, Mass. This company has recently turned out a high-pressure hose wagon for New York City.

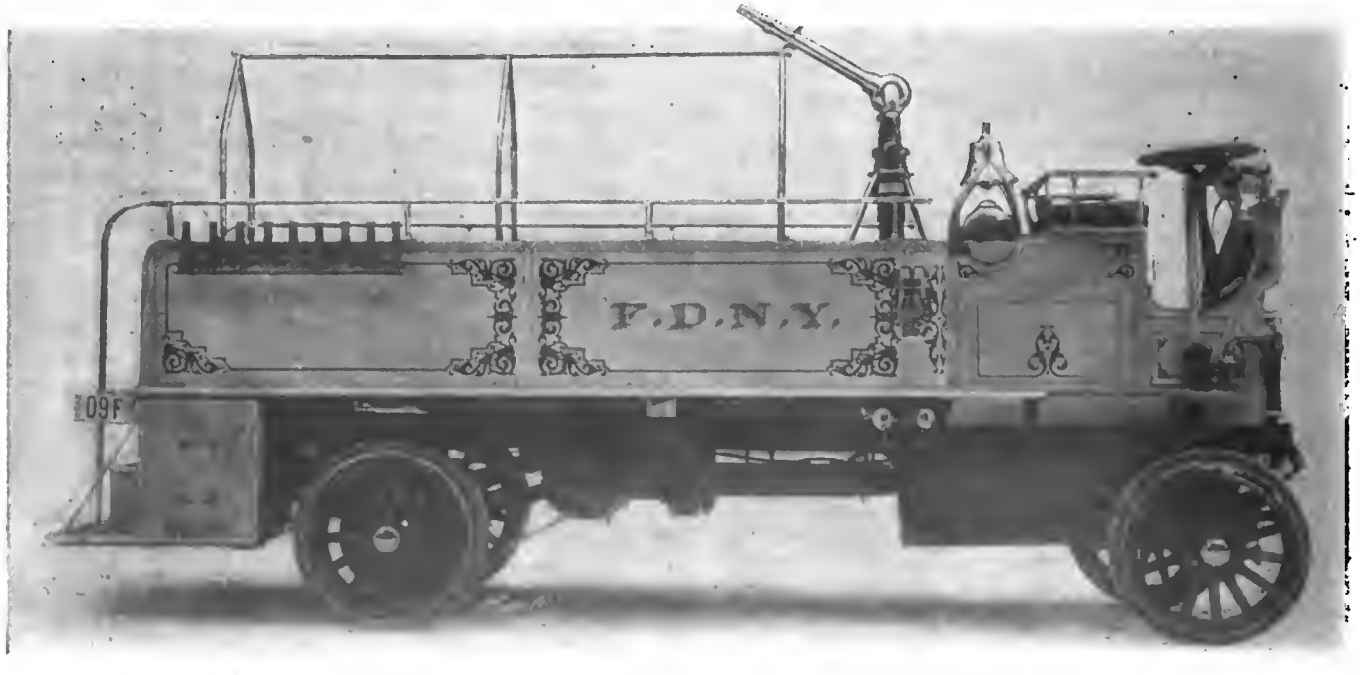
From the factory the wagon was taken to fire headquarters in Springfield and inspected by the Fire Commission and other fire officials. It was then brought over the road to the New York show, following which it was placed in active service.

Fire apparatus in New York City has considerably more to contend with than has that of any other large city, consequently this truck is most characteristic of what heavy fire wagons must be. It is a combination hose wagon and water tower, this latter feature being a large iron pipe in the rear of the driver's seat, into which there are directed four pipes, with outlets and couplings on either side of the truck, just below the driver's seat. Four streams, when converged into the one pipe with a powerful nozzle, will furnish a stream with force enough to throw 25 feet higher than the most powerful water tower.

This wagon will see a different kind of service from the usual type of fire apparatus with motor power in that it will be constantly in action, the engine being required to drive the wagon from place to place and into different positions, according to the progress of the fire and the necessity for the tower.

The chassis for this truck is the regular model 18, five-ton truck, with a maximum road speed of 12 miles per hour. The rated load capacity is 8,000 pounds; wheelbase, 149 inches; tread, 57 inches; tires, solid rubber, 36x4 inches front and 36x4 dual rear; front axle, four-inch I-beam; rear axle, 2½ inches square; Timken roller bearings for all road wheels; five-inch channel steel main frame, four-cylinder, water-cooled 60-horsepower engine, double ignition dry cells and magneto, selective type transmission, three speeds forward and one reverse, double chain drive, foot brake applies on countershaft and hand brake to hubs of rear wheels; semi-elliptic springs, three inches wide, length 40 inches front and 50 inches rear; DeDion system of lubrication from a well in the crank case.

The body of the wagon is known as an iron body, although the floor and partitions are of wood. It is 13 feet 8 inches long, 68 inches wide and 24 inches high. The inside of the wagon is so



High-Pressure Hose Wagon Built for the Fire Department of New York City, by Knox Automobile Company.

divided that there are three compartments suitable for folding 350 feet of hose in each compartment, or 1,050 feet in all, the hose being three inches in diameter and extra heavy. The floor of the wagon is made of slate, with a space underneath for the circulation of air. Under the body of the wagon there is a tool box, and on each side and hanging from the rear are steps wide and long enough to accommodate many firemen.

There are brass and nickel plated railings on the seat and along the sides of the wagon, as well as one railing running the length of the wagon, through the center. A locomotive type of bell is swung between stanchions in the center of the wagon. Fastened to the driver's seat there are three tarpaulins for covering the hose, each being the width of the hose compartment.

The turret pipe, which is the most important part of the body, is located two feet from the driver's seat and in the center of the body. It is a four and a half inch iron pipe and high enough so that when the nozzle is attached the distance from the floor to the tip of the nozzle will be seven feet. Pipe connections extend from the sides of the wagon to the turret pipe and are fitted with three-inch, three-way siamese connections. Four hose connections can be made, so that four streams of water will be thrown into the turret pipe, or if needed four siamese connections can be made to the regular number of connections in such a way as to allow eight streams of water to be turned into the turret pipe. The 18 nozzles that go with the wagon are in three sizes and are carried on holders, nine in a row on each side of the wagon. The running gear of the wagon is maroon, broad gold stripe and salmon colored fine line. The wagon body is white with red stripe and presents a fine appearance, the long body and wheel base giving it a very powerful look.

At the close of the Garden Show the vehicle was driven to the general shops of the fire department for official inspection and later from there to the testing ground at the foot of Gansevoort street. There, under the direction of Commissioner Whitney and Chief Croker, the fireboat *Thomas Willet* supplied it with two streams of water under 300 pounds pressure. The test, shown in the accompanying illustration, was very successful and doubtless other similar fire wagons will be added later.

EXPRESS SERVICE IMPROVED BY MOTOR TRUCKS

THROUGH express from the West now is delivered in New York City just twenty-four hours sooner than it was before the Adams Express Company placed a truck in night service This truck, which is one of the fourteen Packard trucks used by the Adams company in the metropolitan district, runs between the Jersey City dock, garage and distributing station on West 47th Street, station on 124th Street and its Brooklyn depot. The service which it renders through the night allows the actual delivery of Western express packages one day in advance of the previous schedule.

This company was one of the first advocates of motor wagons. Its experience in motor traffic started with steam wagons, which were discarded in favor of electrics. A number of the latter are now used extensively in several cities. This work in the development of motor service has been due to a firm belief in the eventual supersedure of horses for business hauling. The volume of business in New York and other large cities is increasing so rapidly that the old system will soon be rendered absolutely inadequate. Not only has the routine delivery and collection work on established routes become steadily greater, but more territory has to be covered, and this territory will continue to increase. Consequently, motor trucks hauling heavy loads over comparatively long distances will greatly increase efficiency and effect economy.

The recent installation of Packard three-ton trucks is obviously the beginning of an extensive installation of gasoline wagons in New York and other cities. The company's practice speaks particularly well of the Packard trucks, because of the eighteen installed, fourteen are Packards, either the ones just put into service or the smaller trucks which have been doing such good work that they will be continued. The express company has gone about the maintenance of its gasoline trucks in a thorough and practical manner. At 242 West 47th Street there is a special garage of concrete construction, with storage room, repair shop and a staff of mechanics, under the charge of a superintendent of garages, who directs the care of the trucks and plans their usage. Most of the drivers were broken in to the work by the Adams company and constitute a more carefully trained corps than is ordinarily encountered.

"VAN" TO MANAGE CHICAGO KNOX BRANCH.

CHICAGO, Jan. 26.—Arrangements have been consummated whereby N. H. Van Sicklen, well known throughout the industry and the former owner of "Motor Age," will take charge of the Chicago branch of the Knox Automobile Company. Mr. Van Sicklen will assume active charge February 1, and he is busy making extensive arrangements for Knox representation, to include both the pleasure and commercial vehicles manufactured by the company.

Two of the Fourteen Packard Trucks Now in Active Service for the Adams Express Company, in New York City.

GERMAN BEARINGS MAKER VISITS AMERICA.

One of the interested visitors to the Garden show last week was Ernst Sachs, technical head of the great German firm of Fichtel & Sachs, of Schweinfurt, Bavaria. Herr Sachs expressed himself as greatly impressed by the phenomenal growth of the automobile industry in America during the past few years, and remarked that, although the rapid increase in his own export business to this country had prepared him to find automobiles extensively used here, the reality amazed him. Both in its magnitude and in the high degree of excellence achieved by American designers, he pronounced the American automobile industry to have far surpassed anything he ever dreamed could be possible.

In view of the very extensive adoption by American automobile builders of the product of Fichtel & Sachs, it is interesting to note that this firm operates to-day the largest factory in the world devoted to the manufacture of ball bearings, their daily output of about 12,500 ball bearings of all types exceeding that of any other single manufacturer. Of the 20,000 souls making up the population of Schweinfurt, over 2,000 are employed in the F. & S. ball-bearing factory, and 800 in the allied factory where the steel balls are made. Some idea of the magnitude of the plant may be gathered from the fact that the bearing factory uses 1,750 horsepower and the ball factory 800 horsepower, and in the latter plant there are 2,000 machines for grinding balls. Of the total product of balls and bearings, about three-quarters is used outside of Germany—France, England and America being the largest foreign consumers.

Fichtel & Sachs are owners of some of the most valuable patents extant on the subject of ball bearings, including the basic Kouns patent on the side-entering slot, the Sachs patent on the diagonal side-entering slot, and the Blin patent covering the use of side-entering slots shallower than the ball paths. Under the Blin patent the balls are sprung in under pressure, and when once in never again touch the side slots. This permits practically the entire race to be filled with balls, and all F. & S. annular ball bearings are now made under this patent. It is understood that some questions which have arisen in connection with these patents have had something to do with Herr Sachs's visit.

FRANKLIN SALESMEN'S SEMI-ANNUAL.

Syracuse, N. Y., Jan. 25.—The traveling salesmen of the H. H. Franklin Manufacturing Company have just completed their semi-annual conference at the company's factory, reviewing conditions in the automobile trade for the past six months and discussing plans for more than a year ahead. There was a unanimity of belief that an enlarged prosperity would be shown during 1909, both in the manufacture and sale of cars and in practically every other line of business.

During the sessions the salesmen were addressed by Vice-President G. H. Stilwell, on "The Franklin Company's Position in the Association of Licensed Automobile Manufacturers"; by Treasurer H. B. Webb, on "The Season of 1908 from a Financial Viewpoint"; by Manager J. G. Barker, of the sundry department, on "Sundry Matters"; by Manager J. E. Walker, of the advertising department, on "What We Are Doing to Help Sales by Way of Advertising," and by Sales Manager F. R. Bump, on "Our Policy for 1910."

ROBBINS FOR CHICAGO OAKLAND BRANCH.

Chicago, Jan. 25.—A branch house has been established at 1725 Michigan Avenue, by the Centaur Motor Company, of Buffalo, general selling agents for the Oakland Motor Car Company, of Pontiac, Mich. This is the location formerly occupied by the Rainier Company. Arthur M. Robbins, formerly with the Aerocar Company, of New York, and later with the Rainier people of Chicago, will have charge of the new branch. Mr. Robbins is one of the pioneers in the automobile industry and is well known. This branch house will have full charge of the sale of Oakland cars in Chicago and immediate vicinity, as well as carrying a full supply of repair parts.

AUTOMOBILE TAKES TALLY-HO'S PLACE.

Philadelphia, Jan. 25.—The next fortnight will witness a recrudescence of the old tally-ho and post-road days between this city and New York, only instead of the coach-and-four, with relays of horseflesh every ten or dozen miles, the vehicles to be used will be Acme touring cars, the enterprise being backed by the Acme Motor Car Company, of Reading, Pa. The Bellevue-Stratford Hotel, in this city, and the Waldorf-Astoria, in New York, will be the termini of the new line, and the round trip will be made in two days. It is proposed to begin operations with but one car, and add others as the increase of business renders it necessary. The fare for the round trip will be $20. The scheme originated with President H. W. Sternbergh, of the Acme Company, who is very enthusiastic over the outlook.

W. H. BARNARD NOW HEADS IMPORTERS' SALON.

New York, Jan. 25.—At the annual stockholders' meeting of the Importers' Automobile Salon, held at the headquarters of the association in the Bryant Arcade Building to-day, W. H. Barnard, of the Delahaye Import Company, succeeded André Massenet, of the Panhard Company, as president. Mr. Massenet held that office during the past year, but declined a renomination, and Mr. Barnard, who served as vice-president last year, was unanimously elected.

The other officers chosen were: Vice-President, Paul Lacroix, Renault; treasurer, Walter C. Allen, De Dietrich; secretary, E. Rand Hollander, Fiat. Besides the officers the following were elected to serve on the board of directors: Harry Fosdick, Lancia; A. C. Andrade, Jr., Isotta, and Julian Block, C. G. V.

Walter C. Lee was reappointed general manager. Although the past year has been the most trying one that the importers have had, the report of the treasurer showed the association to be in excellent financial condition.

RENAULT LEADS THE FOREIGNERS.

New York City, Jan. 25.—To followers of the American automobile industry, import and export figures are always very interesting. This has been particularly true in the past year or two, so that the recently published figures of the Custom House are of more than passing interest. These figures show that twelve foreign makes of cars have been imported to the number of 735. These include one German, four Italian and seven French cars. The figures are:

Renault, 244; Fiat, 149; Panhard, 89; Mercedes, 89; Isotta, 40; Itala, 24; Hotchkiss, 22; DeDietrich, 19; Lancia, 18; C. G. V., 16; De Launay Belleville, 14; and Rochet Schneider, 11.

In noting the Renault's large lead over the others, it will be remembered that in 1907 this maker also led, but with a smaller number of cars, 214. So the past year shows, at least for this maker, a gain of 14 per cent. These figures also include taxicabs, of which a number have been brought in, particularly for service in this city, where the sloping bonnet of this leading French make is a familiar sight.

Renault with Berline Body, Now Popular in Paris.

News in General

Mrs. K. R. Otis, who Made a Notable Midwinter Trip from New York to Boston and Return, in Stearns Car.

Round-the-World Tourers in Republic Wreck.—H. A. Hover and wife, the transcontinental tourists from Spokane, Wash., reached the East coast after an uneventful trip and sailed on January 22 on the ill-fated *Republic*, which was wrecked. Nothing daunted, they will make a fresh start on another boat and pick up their car, which was forwarded on another steamer, on the other side. Their present destination is Algiers, where they will resume their trip around the world. They are making their trip in a four-cylinder 30 horse-power Maxwell touring car, with an equipment consisting of a tent and the necessary utensils for camping, as the countries where they are going are such that it will be necessary for them to pass many nights without shelter of any kind. In all, they have already traveled 7,000 miles in this country.

100,000 Miles on 1909 Warner Odometer.—The Warner Instrument Company's odometer for 1909 will show a season total of 100,000 miles instead of 10,000, as stated in our January 7 issue. In the past most speedometers for mileage recorders have shown only 10,000 miles, hut letters received from many car users indicate season mileage of 30,000 and 40,000 miles, thus necessitating a larger instrument. This new model, as well as all others, will have the new shaft and simplified drive. This is a pressed-steel, hand-riveted, hardened-shaft which will make but one-half the number of revolutions made in former instruments.

Tom Lynch's New Job.—The automobile owner will be insured a better tire by more thorough tests on the part of manufacturers, so it is a source of pleasure to chronicle the announcement that many makers are establishing a new department of tests to take care of this work. The latest announcement in this line comes from the Continental Caouchouc Company, which has placed the well-known automobile driver and racing man, Tom Lynch, in charge. Each style of tire will be tested out on a Lozier Briarcliff model, covering from 100 to 150 miles each day regardless of weather.

In Maryland, Not in Indiana.—In the January 14 issue of THE AUTOMOBILE it was stated that the Carter Motor Car Corporation's factory was located at Hyattville, Ind., whereas it is in reality located at Hyattsville, Md.

PERSONAL TRADE MENTION.

William F. Hurlbut, for several years manager of the New York branch of the Packard Company, and until recently president of the Garford Motor Car Company, of New York, recently resigned from the latter office to become connected with the New York representation of the E. R. Thomas Motor Company, of Buffalo. Mr. Hurlbut has just returned from an extended trip abroad. He is planning an active campaign in support of the Thomas interests.

Thomas J. Wetzel, who has been confined to his New York City home for an extended period by an attack of typhoid fever, was one of the visitors of the Garden show who received a very cordial welcome from his friends, as he was very seriously ill, and at one time his recovery was in doubt.

E. T. Birdsall, designer of the Selden car, and who has been chief engineer of the Selden Motor Vehicle Company, Rochester, N. Y., for the past two years, has severed his connection with the concern in question. Mr. Birdsall expects to make an announcement concerning his plans in the near future.

Lawrence C. Fuller, has been appointed general manager of the Philadelphia branch of the Chadwick Engineering Works, of Pottstown, Pa. Mr. Fuller is well known to the trade, having been with Thornton & Fuller, Simplex agents, and with the J. M. Quimby & Co., representatives.

V. M. Palmer, at one time connected with the Hagerstown plant of the Pope Manufacturing Company, has succeeded E. T. Birdsall as chief engineer of the Selden Motor Vehicle Company, Rochester, N. Y. Mr. Palmer entered upon the duties last week.

E. G. Mertens, with the Electric Vehicle Company as a salesman, has severed that connection and will go into business for himself. He has bought an interest in the Glens Falls Auto Company of Glens Falls, N. Y., and at a recent meeting was elected its vice-president.

Edwin B. Finch, formerly in the technical department of the Packard Motor Car Company, Detroit, has resigned and will be with the Chalmers-Detroit Company. He is well known in the trade having at one time manufactured cars.

V. A. Charles, former manager of the Rambler Boston branch, has accepted a similar position with the S. M. Supplies Company in Boston. This firm will open salesrooms at 22 Lincoln street and will have the Midland agency.

A. W. Harris Oil Company, Providence, R. I. | The Keystone Lubricating Company, Philadelphia, Pa. | Havoline Oil Company, New York City.

Three Prominent Lubricating Exhibitors Who Exploited Their Products in the Madison Square Garden Show.

ONE CONCERN'S PUBLICITY.

After a good car has emerged from the factory, it is a necessitated sequence that well directed publicity should proceed and follow in its wake. The proper use of the art of the printer comes pretty close to being a science, and therein E. Ralph Estep, advertising manager of the Packard Motor Car Company, gives evidence of his past experience in the "Art Preservative." Estep usually participates in Packard performances of all kinds, and his material is usually right "off the bat," and apropos.

E. Ralph Estep.

Recent issues from his department include several notable examples. In "Following the Confetti" are pictorially presented incidents in the journey of the Packard official press car on the Glidden tour of 1908. No better advertisement of this year's event could be utilized by the A. A. A. Contest Board than a distribution of this inviting and neatly bound pictorial tale.

"A Family Tour from Ocean to Ocean," by J. M. Murdock, is an account of the 1908 tour of the author and his family across the country in a Packard "30," wherein he expresses appreciation "of my Packard car for its wonderful stability, capability, and reliability."

"The Flight of the Thirty" is the story of an overland dash of 606 miles from Detroit to Chicago and back in the space of 20 hours 35 minutes. Sales Manager S. D. Waldon was the man at the wheel, but Fred Graves relates the story.

Another little pamphlet is devoted to the "Pittsburg to Philadelphia, 14 Hours 1 Minute" performance. Of course, the company issues a calendar, and this, too, is a work of art, with neat sketches of more or less Packard complexion.

NOW PIERCE ARROW MOTOR CO.

When the rumor was circulated at the show last week that Colonel Charles Clifton and all of his associates in the George N. Pierce Company, Buffalo, had resigned from that concern, it spread like wildfire, and as it received the smiling confirmation of Colonel Clifton himself, when he was approached on the subject, it was at first thought to be literally true. What actually did happen was the organization of the Pierce Arrow Motor Company, a corporation formed to take over the entire assets, good-will, and business of the George N. Pierce Company. There will be no change in the business and the officers remain the same, these being: President, George H. Birge; vice-president, Henry May; treasurer, Charles Clifton; secretary, Laurence H. Gardner; the directorate being comprised of the foregoing officers together with William B. Hoyt, so that the change is merely one of name.

In order to provide for the carrying on of the business of the company and to take care of future developments, the capitalization has been increased.

IN AND ABOUT THE AGENCIES.

American and Grout, Philadelphia.—A new company, the Stoyle Automobile Company, has taken the agency for the American car, the territory being Eastern Pennsylvania, New Jersey, New York, Delaware and Maryland. In addition the Grout, made in New England, will be handled. The members of the firm are W. H. Stoyle and Louis Vogel, both well known in Philadelphia. The company has taken the large building at the southeast corner of Broad and Race streets.

Goodyear Tires on Pacific Coast.—The W. D. Newerf Rubber Company of Los Angeles, Pacific Coast agents for the Goodyear Company has completed arrangements to represent this company in British Columbia, Oregon, Washington, Idaho, Nevada, Arizona, Mexico and the Hawaiian Islands. In addition to having large stores in Los Angeles and San Francisco, branches will be established in Vancouver, B. C.; Seattle, Spokane Falls, Pasadena, City of Mexico and Honolulu.

Firestone Tires, Los Angeles, Cal.—A new direct branch has been opened by the Firestone Tire & Rubber Company at 957 South Main street, where the whole of Southern California will be cared for. G. C. Calbetzor, formerly Pacific Coast representative, and Frank R. Talbott, former assistant treasurer, the Akron factory, will have charge.

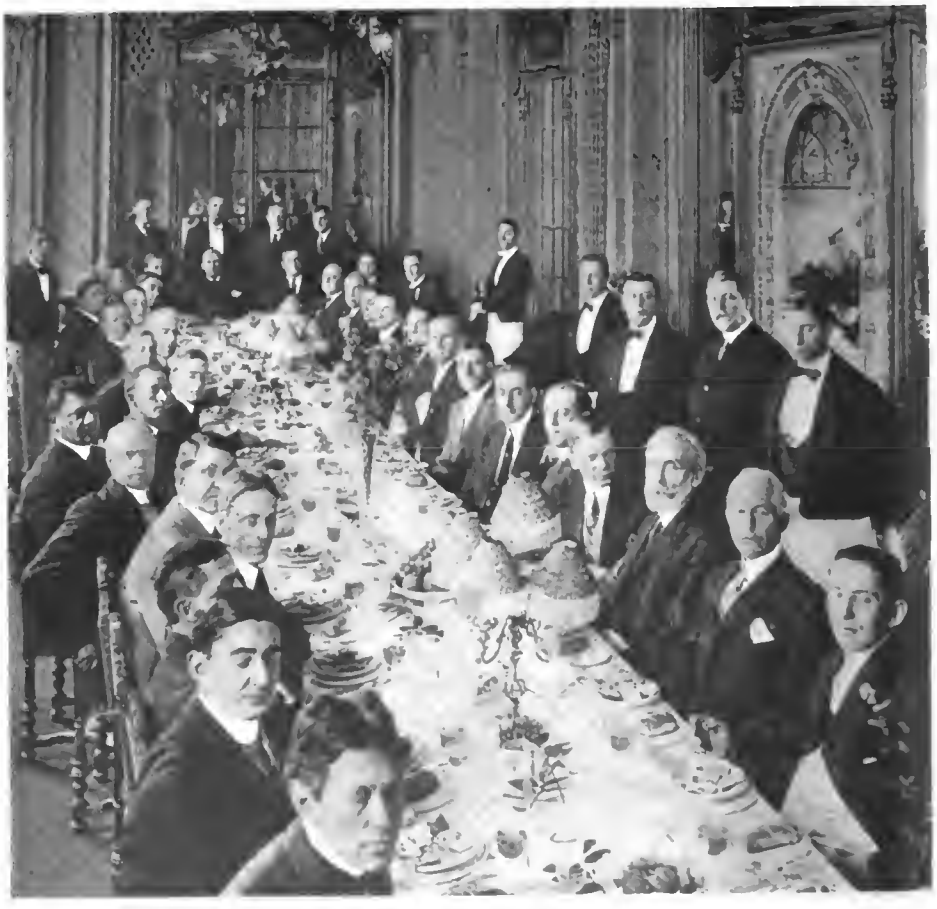
Benz, New York City.—One of the finest show rooms along that portion of the Great White Way known as Automobile Row, has been fitted up for and is now occupied by the Benz Auto Import Company of America. This is located at 1599-1601 Broadway, where a full line of Benz cars may be seen.

Post & Lester, New England.—Two new branch retail stores have been opened by the Post & Lester Company, Hartford, Conn., at 1085 Chapel street, New Haven, Conn., and 125 Ridge street, Springfield, Mass. Both houses will handle auto accessories exclusively.

New Peerless New York Branch Will Be Imposing.

OBITUARY.

H. F. Kellogg, New England representative of Hoyt Electrical Instrument Works, Penacook, N. H., died at Newton, Mass., January 16. Mr. Kellogg was particularly well known in the industry, in which he had many friends, who will regret to learn of his death.



E. R. Thomas Motor Company's Luncheon to George B. Selden.

At this function E. R. Thomas presented to Mr. Selden the license plate which was carried round the world by the Thomas winner of that event.

VOL. XX NEW YORK—THURSDAY, FEBRUARY 4, 1909—CHICAGO No. 5

THE AUTOMOBILE

CHICAGO, FEB. 4.—And now comes the real national automobile show of the country—that of the National Association of Automobile Manufacturers, held in the Coliseum and First Regiment Armory. Of course, S. A. Miles is the general manager of the show, the committee for which also includes A. L. Pope, chairman; Windsor T. White, Thomas Henderson, C. C. Hildebrand and W. E. Metzger—all pioneers of an unparalleled industry.

This national display—and Chicagoans are proud in their claim that it is the only event of its kind that is truly national—will eclipse its predecessors in number of exhibitors, variety of displays, and lavishness of decorative and lighting effects. Indications are that every record for attendance will be shattered, and ample preparations have been made for caring for the thousands, not only from Chicago but from all parts of the West, who will throng the two capacious buildings, which will be filled to the bursting point.

Given under N. A. A. M. auspices, every interest has worked in harmony for the success of the show. Every detail has received the careful attention of some member of the committee having such matters in charge. Everywhere has been in evidence the spirit of the West, the steady pulling together to achieve a common result, the swift mastering of details and rapid rounding of them into perfected form, the obliteration of discords and jealousies, and the placing of every exhibitor on an equal footing.

Scenes typical of the West, too, will be in evidence during the progress of the national show. Particularly marked, along this line, will be the opening of the doors of the show at 8 o'clock each morning to accommodate dealers from the West who prefer going direct to the show from the train and immediately begin business.

Another characteristically Western feature will be the presence of the farmers, coming from long distances and putting an end to the common error that the farmer is the implacable enemy of the motor-driven vehicle. The prosperity of the West is of all classes, and the farmer each year is taking up motor vehicles in increasing numbers.

All that has been accomplished here has been done in less than a decade, for the first Chicago show goes back only to 1900. The association now known as the National Association of Automobile Manufacturers, Inc., came into existence about ten years ago, in New York. Five years later came the trade dispute and the organization of both the Association of Licensed Automobile Manufacturers and of the American Motor Car Manufacturers Association, thus dividing the old association membership. Following this breach, really a trade quarrel, came the two New York shows, the Licensed association securing the Madison Square Garden, and the other organization taking up the Grand Central Palace show.

While New York has had her two shows annually, and because of the rivalry neither can fully claim really national characteristics, Chicago has remained neutral, knowing neither the "licensed" nor "unlicensed" maker, and inviting each to meet on common ground in the Coliseum and Armory, select exhibit space by lot, and stand in all respects equal. In this way Chicago holds for her show the features that make it truly national, and the marvellous growth since that first show in the Windy City testifies most eloquently to how public and manufacturers alike look upon it.

The first show in Chicago, in 1900, was promoted without reference to any association. The automobile manufacturers were few, exhibits consequently difficult to secure, yet, despite all obstacles, the show was held. From the standpoint of the managers it was not a financial success, but the exhibitors found in it something that proved almost a gold mine. Enthusiasm was aroused among agents, prospective buyers, and the public at large, and before the show closed its doors every exhibitor had applied for space in the show that was to be given the ensuing year.

The next year found the available space increased by using the Coliseum annex. In earlier days it had been considered essential that the cars be seen in motion, and to meet this demand a track eighteen feet wide encircled the building. The second year found the track, owing to the demands for space coupled with the opinions of the manufacturers that it was not necessary, abandoned for all time and in its place two great machines had been erected on which cars might be driven at highest speed while a dial indicated the distance traveled.

It was during this show, too, that the National Association of Automobile Manufacturers, Inc., first appeared and every show since that time has been given under the auspices of that organization. This second show, considering the condition of the automobile industry at that time, has never been excelled. It demonstrated the absolute need of a Western exhibit, regardless of what shows New York might offer, and since that time the history of the Chicago automobile show is the record of steady, well-founded growth.

For the third show the Coliseum annex was added and the second floor of the annex had to be pressed into service for the fourth show. When the fifth was given, in order to accommodate exhibitors it became necessary to not only add the First Regiment Armory but to floor over the seating space in the Coliseum gallery as well, and even then the demand could not be fully met.

The sixth show managed with the same quarters, but the seventh found added the basement of the Coliseum annex and the Seventh Regiment Armory for comercial vehicles. This gave a combined floor space of 150,000 square feet.

This year's show finds 323 exhibitors placed, and about one hundred of them are showing an average of three automobiles each. A feature of particular interest promises to be the motorcycle display, twenty-one makers having secured space.

In decorations the 1909 show will eclipse its predecessors, lavish as they have been. The success of the papier-mâché work last year justified its use this year again, supplemented by staff. The 1909 show will be a show of bronze, or copper, or old gold, to suit the pleasure of the visitor.

Down the center of each of four groups of equal size will run a column of massive pillars, supporting representations of bronze statuary, each designed and made for the occasion and bearing the imprint of automobiling, sport, utility, and commerce combined. The principal feature in each group will be a massive wheel, six feet in diameter, placed at a height of fifteen feet, and below it a man of heroic size in the act of giving it impetus.

The electric lighting will be brilliant. Sixty-four flaming arcs are to be used in addition to the usual lighting equipment and smaller decorative effects, such as 250 twelve-inch globes and a greater number of incandescent lights.

It is not generally known perhaps that the Coliseum is the largest structure devoted to amusements and public gatherings in the United States, largely exceeding the size of Madison Square Garden, and with its galleries and annex affording about 10,000 more square feet of exhibition space.

Among the meetings to be held during the show, in addition to that of the National Association of Automobile Manufacturers, which will meet to elect officers, and of the American Automobile Association, are those of the National Retail Automobile Dealers' Association, and the National Association of Chauffeurs.

SOME GOSSIP OF THE SHOW.

Chadwick's Independent Show.—In view of the great prominence which the Chadwick Great Six stock car has won for itself in every event in which it has been entered during the past year, not a few of the visitors to the Coliseum will be disappointed at being unable to find the exhibit of the Chadwick Engineering Works there. The makers explain their absence as being due to the fact that they were unable to secure what they considered proper exhibition space and accordingly decided to confine their exhibit to the Chicago salesrooms at 1218 Michigan avenue, where H. B. Larzelere, sales-manager of the company, will be in charge throughout the week, assisted by the Chadwick Chicago representative.

Annual Gathering of the Pioneers.—One of the social functions of the show will be the third annual gathering of the Auto-Cyclo Pioneers, those who were connected with the predecessor of the automobile and have a connection with the succeeding industry. Present plans include a beefsteak supper on Wednesday night at the Southern Hotel, immediately after the closing of the show. The affair is in charge of a committee of "old timers," the secretary of which is George G. Greenburg, whose Chicago address is 1380 West Jackson boulevard. Of course, there will be something to eat, some music, and some talk about the days that are gone; in fact, nothing at all elaborate is planned, but simply a get-together of those who progressed from one industry into its natural successor.

White Books of White Matches.—Unconsciously, or rather unintentionally, The White Company may become a quasi-offender against the universal rule of "No smoking" that now prevails at all automobile shows, by supplying handy books of white-headed matches to all comers. A match is an incentive to light a cigar, particularly where this essential has been lacking hitherto, but this will not prevent the distribution of thousands of these neat little books during the course of the show at the Coliseum, and many a smoker will carry a White souvenir around with him for the next week or so. The advertising embodied in the souvenir is brief and directly to the point, reading on the flap: "The White Steamer is the only make of car which has been favorably reported on by the United States Government. The White Steamer is the only American touring car sold in quantity in England, France, Germany, and Italy in competition with the home product." It will carry its message home to thousands before the rows of White matches have all served their purpose and gone the way of their predecessors.

CHICAGO'S LIST OF EXHIBITORS

AMERICAN GASOLINE PLEASURE CARS.

AMERICAN SIMPLEX: Simplex Co., Mishawaka, Ind..C.M.F. N-1
APPERSON: Apperson Bros. Auto Co., Kokomo, Ind....C.M.F. E-1

ESSENTIAL DETAILS OF THE 1909 CAR LIST

FIRST came the Grand Central Palace Show of the American Motor Car Manufacturers' Association and the Importers' Automobile Salon. Next followed the Madison Square Garden Show of the Association of Licensed Automobile Manufacturers. Now comes the Chicago exhibition of the National Association of Automobile Manufacturers.

In this show the two New York affairs are practically rolled into one. Since the participants in the three shows compose the flower of the American automobile industry, a tabular summary will prove both interesting and instructive and convenient to the man who is about to buy a new car and perforce desires to regulate his purchase by consideration of the dollar mark.

Therefore, herewith is presented the roll call of, with few exceptions, all the cars on sale at the present time:

AMERICAN GASOLINE PLEASURE CARS.

CARS AND MODEL	Maker	Price	H. P.	Type
Peerless 25	Peerless Motor Car Co	$7,300	57	Landaulet
Pierce-Arrow 60	Pierce-Arrow Motor Car Co.	$7,200	60	Landau
Peerless 25	Peerless Motor Car Co	$7,000	57	Limousine
Welch	Welch Motor Car Co	$7,000	75	Optional
Simplex	Simplex Automobile Co	$6,750	53	Landaulet
Chadwick	Chadwick Eng. Works	$6,500	60	Runabout
De Luxe C	De Luxe Motor Car Co	$6,250	50–60	Limousine
Pierce-Arrow 48	Pierce-Arrow Motor Car Co.	$6,200	48	Landaulet
Thomas 6-70	E. R. Thomas Motor Co	$6,000	72	Touring
Thomas 4-60	E. R. Thomas Motor Co	$6,000	53	Limousine
Alco	American Locomotive Co	$6,000	60	Touring
Acme XXV	Acme Motor Car Co	$6,000	60	Touring
Pierce-Arrow 50	Pierce-Arrow Motor Car Co.	$6,000	60	Touring
Peerless 25	Peerless Motor Car Co	$6,000	50	Touring
Welch	Welch Motor Car Co	$6,000	75	Optional
Austin	Austin Automobile Co	$6,000	60–90	Limousine
Oldsmobile Z	Olds Motor Works	$6,000	54	Landaulet
Lozier I	Lozier Motor Co	$6,000	51	Touring
Lozier H	Lozier Motor Co	$6,000	44	Limousine
Locomobile 40	Locomobile Co. of America	$5,900	40	Limousine
Peerless 19	Peerless Motor Car Co	$5,800	38	Landaulet
Oldsmobile Z	Olds Motor Works	$5,800	54	Limousine
Stearns 30-60	F. B. Stearns Co	$5,750	46	Limousine
Simplex	Simplex Automobile Co	$5,750	53	Touring
Simplex	Simplex Automobile Co	$5,750	53	Speed Car
Royal-Tourist M	Royal-Tourist Car Co	$5,700	48	Limousine
Packard 30	Packard Motor Car Co	$5,650	40	Landaulet
Packard 30	Packard Motor Car Co	$5,550	40	Limousine
Chadwick	Chadwick Eng. Co	$5,500	60	Touring
Welch	Welch Motor Car Co	$5,500	50	Limousine
Peerless 19	Peerless Motor Car Co	$5,500	38	Limousine
Pierce-Arrow 40	Pierce-Arrow Motor Car Co.	$5,400	40	Limousine
Studebaker B	Studebaker Automobile Co.	$5,100	36	Landaulet
Alco	American Locomotive Co	$5 000	40	Touring
Walter M	Walter Automobile Co	$5,000	48	Touring
American Simplex D	Simplex Motor Car Co	$5,000	50	Limousine
Austin	Austin Automobile Co	$5,000	60–90	Touring
Austin	Austin Automobile Co	$5,000	50–60	Limousine
Studebaker D	Studebaker Automobile Co.	$5,000	36	Limousine
Lozier H	Lozier Motor Co	$5,000	44	Briarcliff
Knox M	Knox Automobile Co	$5,000	48	Touring
American	American Motor Car Co	$5,000	50	Limousine
National 9-60	National Motor Veh. Co	$5,000	60	Touring
De Luxe	De Luxe Motor Car Co	$5,000	50–60	Optional
Pierce-Arrow 48	Pierce-Arrow Motor Car Co.	$4,800	48	Touring
Austin	Austin Automobile Co	$4,700	60–90	Roadster
Stearns 30-60	F. B. Stearns Co	$4,700	46	Pullman
Apperson K	Apperson Bros. Auto. Co	$4,700	48	Touring
Pierce-Arrow 36	Pierce-Arrow Motor Car Co.	$4,650	36	Brougham
Stearns 30-50	F. B. Stearns Co	$4,600	46	Touring
Thomas 4-60	E. R. Thomas Motor Co	$4 500	53	Touring
Thomas 6-40	E. R. Thomas Motor Co	$4,500	31	Limousine
Alco	American Locomotive Co	$4,500	22	Limousine
Welch 4-L	Welch Motor Car Co	$4,500	50	Touring
Welch 4-O	Welch Motor Car Co	$4,500	50	Close Coupled
Welch 4-M	Welch Motor Car Co	$4,500	50	Runabout
Royal-Tourist M	Royal Tourist Car Co	$4,500	48	Touring
Apper.-Toledo XXII	A.-T. Motor Car Co	$4,500	38	Touring
Apperson-Toledo XXI	A.-T. Motor Car Co	$4,500	38	Runabout
Matheson E	Matheson Motor Car Co	$4,500	40	Touring
Acme XX	Acme Motor Car Co	$4,500	48	Touring
Acme XXI	Acme Motor Car Co	$4,500	48	Runabout
Gaeth XXI	Gaeth Automobile Co	$4,500	38	Limousine
Oldsmobile ZR	Olds Motor Works	$4,500	54	Runabout
Oldsmobile Z	Olds Motor Works	$4,500	54	Touring
Locomobile 40	Locomobile Co. of America	$4,500	40	Touring
Winton 6-18	Winton Motor Carriage Co	$4,500	60	Touring
Packard 18	Packard Motor Car Co	$4,400	26	Landaulet
Packard 18	Packard Motor Car Co	$4,300	26	Limousine
Peerless 19	Peerless Motor Car Co	$4,300	38	Touring
Peerless 19	Peerless Motor Car Co	$4,300	38	Roadster
Moon D	Moon Motor Car Co	$4,250	32	Brevette
Winton 6-17	Winton Motor Carriage Co	$4,250	48	Limousine
National 9-50	National Motor Veh. Co	$4,200	50	Touring
Packard 30	Packard Motor Car Co	$4,200	40	Touring
Packard 30	Packard Motor Car Co	$4,200	40	Runabout
Oldsmobile D	Olds Motor Works	$4,000	36	Landaulet
Alco	American Locomotive Co	$4,000	22	Touring
American Simplex D	Simplex Motor Car Co	$4,000	50	Touring
American Simplex D	Simplex Motor Car Co	$4,000	50	Runabout
Great Western 22	Model Automobile Co	$4,000	50	Touring
Austin 50	Austin Automobile Co	$4,000	50–60	Touring
American "Tourist"	American Motor Car Co	$4,000	50	Touring
American "Traveler"	American Motor Car Co	$4,000	50	Runabout
Stevens-Duryea Y	Stevens-Duryea Co	$4,000	54	Touring
Studebaker D	Studebaker Automobile Co.	$4,000	36	Touring
Studebaker B	Studebaker Automobile Co.	$4,000	36	Speed Car
Pierce-Arrow 36	Pierce-Arrow Motor Car Co.	$4,000	36	Touring
Pierce-Arrow 24	Pierce-Arrow Motor Car Co.	$3,950	24	Landaulet
Apperson Little 6	Apperson Bros. Auto. Co	$3,900	45	Touring
Moon D	Moon Motor Car Co	$3,850	32	Town Car
Austin 45	Austin Automobile Co	$3,850	45–50	Limousine
Stearns 15-30	F. B. Stearns Co	$3,800	32	Landaulet
Oldsmobile D	Olds Motor Works	$3,800	36	Limousine
Pennsylvania E	Penn. Auto-Motor Co	$3,800	36.8	Touring
Austin 50	Austin Automobile Co	$3,750	50–60	Runabout
Franklin H	H. H. Franklin Mfg. Co	$3,750	43	Touring
Stevens-Duryea X	Stevens-Duryea Co	$3,750	36	Limousine
American	American Motor Car Co	$3,750	50	Roadster
Mora	Mora Motor Car Co	$3,750	42–50	Roadster
Marmon 50	Nordyke & Marmon Co	$3,750	50–80	Touring
Marmon 50	Nordyke & Marmon Co	$3,750	50–60	Close Coupled
Meteor F	Meteor Motor Car Co	$3,750	45–50	Touring
Meteor F-1	Meteor Motor Car Co	$3,750	45–50	Baby Ton
Columbia 48	Electric Vehicle Co	$3,750	29	Limousine
Pope-Hartford S	Pone Mfg. Co	$3,750	30	Landaulet
National 9-40	National Motor Veh. Co	$3,700	40	Touring
Acme XXVII	Acme Motor Car Co	$3,700	35	Touring
Dorris	Dorris Motor Car Co	$3,600	28.9	Limousine
Mora	Mora Motor Car Co	$3,600	42	Touring
Lozier Little Six	Lozier Motor Co	$3,500	33	Touring
Studebaker A	Studebaker Automobile Co.	$3,500	27	Suburban
Stevens-Duryea U	Stevens-Duryea Co	$3,500	36	Touring
Royal Tourist X	Royal-Tourist Car Co	$3,500	42	Touring
Royal-Tourist Y	Royal-Tourist Car Co	$3,500	42	Close Coupled
Oldsmobile Dr	Olds Motor Works	$3,500	36	Coupe
Moon D	Moon Motor Car Co	$3,500	30–35	Touring
Speedwell ME	Speedwell Motor Car Co	$3,500	40	Limousine
Acme XXVI	Acme Motor Car Co	$3,500	30	Touring
Locomobile 30	Locomobile Co. of America	$3,500	32	Touring
Locomobile 30	Locomobile Co. of America	$3,500	32	Runabout
Palmer-Singer XXXII	Palmer & Singer Mfg. Co	$3,500	28	Laundaulet
Palmer-Singer LXII	Palmer & Singer Mfg. Co	$3,500	57	Short Ton.
Corbin 14	Corbin Motor Veh. Corp	$3,500	32	Limousine
Pullman M	York Motor Car Co	$3,500	40	Touring
Pittsburg Six D	Ft. Pitt Motor Mfg. Co	$3,500	54	Touring
Premier 45	Premier Motor Mfg. Co	$3,500	45–55	Touring
Premier 45	Premier Motor Mfg. Co	$3,500	45–55	Runabout
Marmon 45	Nordyke & Marmon Co	$3,500	45–50	Runabout
Gaeth XX	Gaeth Automobile Co	$3,500	38	Touring
Gaeth XX	Gaeth Automobile Co	$3,500	38	Close Coupled
Mora Light Six	Mora Motor Car Co	$3,500	42–50	Racytype
Apperson M	Apperson Bros. Auto. Co	$3,500	36	Touring
Palmer-Singer LXII	Palmer & Singer Mfg. Co	$3,520	57	Runabout
Coates-Goshen 25	Coates-Goshen Auto. Co	$3 250	25	Landaulet
Gearless	Gearless Motor Car Co	$3,250	30–60	Optional
KisselKar	Kissel Motor Car Co	$3,250	60	Coupe
Pittsburg Six C	Ft. Pitt Motor Mfg. Co	$3,200	54	Roadster
KisselKar D-9	Kissel Motor Mfg. Co	$3,200	40	Limousine
Packard 18	Packard Motor Car Co	$3,200	26	Touring
Packard 18	Packard Motor Car Co	$3,200	26	Runabout
Stearns 15-30	F. B. Stearns Co	$3,200	32	Touring
Stearns 15-30	F. B. Stearns Co	$3,200	32	Runabout
Pierce-Arrow 24	Pierce-Arrow Motor Car Co.	$3,100	24	Runabout
Owen Thomas	Owen Thomas Motor Co	$3,000	48	Touring
Coates-Goshen 32	Coates-Goshen Auto. Co	$3,000	32	Touring
Moon C	Moon Motor Car Co	$3,000	30–35	Touring
Moon C	Moon Motor Car Co	$3,000	30–35	Runabout
Pittsburg Six B	Ft. Pitt Motor Mfg. Co	$3,000	54	Runabout
KisselKar G-9	Kissel Motor Car Co	$3,000	60	Touring

ALL RIGHT, NOW, FOR CLEVELAND SHOW.

CLEVELAND, Feb. 2.—After considerable fluttering, the dove of peace has decided to rest securely on the local automobile show, scheduled for the week of February 22. Because all the dealers could not secure space which they considered suitable, an effort to hold a separate show was considered by some. Cooler heads have probably prevented this, and there is now little likelihood of any such venture. As it now stands, however, the Pierce-Arrow, Mitchel, Mora and Regal will not exhibit locally. Some of the dealers refused to accept balcony space, that being the underlying cause of the trouble. It is impossible to get all in on the ground floor, owing to lack of space.

CARS HAVING THEIR FIRST 1909 SHOWING

ONE big event has the advantage of including everything to be seen by way of automobiles in a way to render comparison much more easy, and with less chance of defeating the aim. The average autoist goes to an automobile exhibition with the idea of sizing up the situation against the time when it will be up to him to pick the car which will more nearly accord with his needs, and memory is too treacherous to enable him to do full justice to the situation when the cars have to be examined in two installments, with a difference in time of two weeks.

In New York City some of the cars did not show in either the Palace or the Garden, and it is fortunate for the interested autoist that in Chicago all are to be seen at one time and place. Also as a matter of fact it seems that at Chicago there are quite a number of exhibits which were not at the shows in New York, and it is of equal interest to note that even the companies which did show in the metropolis found it desirable to vary the scenery to quite some extent, in that they went to Chicago prepared to extend the interest so as to include types of cars not displayed before for 1909 selling.

In the tabulations of cars will be found quite a number which are introduced for the first time at Chicago, and the electric section will be of especial interest. The situation at Chicago, taking it as a whole, leaves little to be desired, and as before stated it is a great advantage to be able to see all the cars at one time and make a selection in the light of all the facts. Herewith are described some of the new faces, in one way or another, for 1909. They represent a certain advance in the industry, and that they are potent factors is fully assured.

Auburn.—The Auburn Automobile Company, Auburn, Ind., has brought out an entirely new model this year which will be built in connection with its present two-cylinder model. The new model is equipped with a four-cylinder Rutenber motor, the cylinders being separately cast with integral heads, water jackets and valve chambers. Valves are all on one side. The camshaft, crankshaft, and connecting rods are all drop forgings with ground bearing surfaces, and cams are integral with shafts. The crankcase, of cast aluminum alloy, is divided horizontally and all bearings are contained in the upper half—the lower portion acting as a reservoir for the self-contained oil system. The lower part of the case is divided into four compartments, and the level is maintained by an overflow arrangement and a gear pump. Features of the cooling system are the solid brass water connections, the bronze water pump attached to the end of the camshaft by means of a square-jawed self-centering coupling, the adjustable belt-driven fan attached to the front cylinder, and the cellular type of vertical tube radiator. The carbureter shuts the main air intake to facilitate starting in cold weather. Jump spark ignition with a standard storage battery, dry cells, Lacoste timer and a vibrator coil on the dash, is the regular equipment, but provision is made for the attachment of a Bosch magneto. The multiple disc clutch is contained in an aluminum housing which is part of the transmission case and runs in oil. The transmission of the sliding gear, selective type has three forward speeds, and is fitted with Hess-Bright ball bearings. Drive is by shaft to a floating type rear axle, which is equipped with ball thrust and roller-bearings. The front axle is a one-piece I-beam forging with bronze bushings for the steering spindles. The frame is pressed steel, elliptic springs being used in the rear. The brakes are of the contracting and expanding type on the rear wheel drums. This car has 106-inch wheelbase, 10 inches road clearance and 58-inch tread. The smaller car is practically unchanged, the same two-cylinder, double-opposed, water-cooled motor being used.

Bendix.—The Bendix Automobile Company, Chicago, is building four motor buggy models. No. 4 and No. 5, equipped with roadster and surrey bodies, have a four-cylinder vertical, water-cooled motor, friction transmission, double chain drive, 96-inch wheelbase, and 41-inch wheels equipped with 2-inch solid tires. Models 9-H and 9-L are roadsters with single or double rumble seats, the same motor as in other models, multiple disc clutch, selective transmission, double chain drive, 41-inch wheels equipped with 3-inch solid tires, full elliptic springs, and a wheelbase of 105 inches. The cylinders of this motor are cast in pairs with integral heads, valve chambers and water jackets; valves are all on one side and operated from a camshaft within the crankcase. The camshaft bearings are of the annular ball type; crankshaft and connecting rod bearings are of Banca babbitt with phosphor bronze wrist-pin bushings. Ignition is jump spark with Splitdorf magneto, dry cells and one set of plugs; the honeycomb radiator, a centrifugal pump, and a belt-driven fan constitute the cooling system. Annular ball bearings are used throughout the transmission.

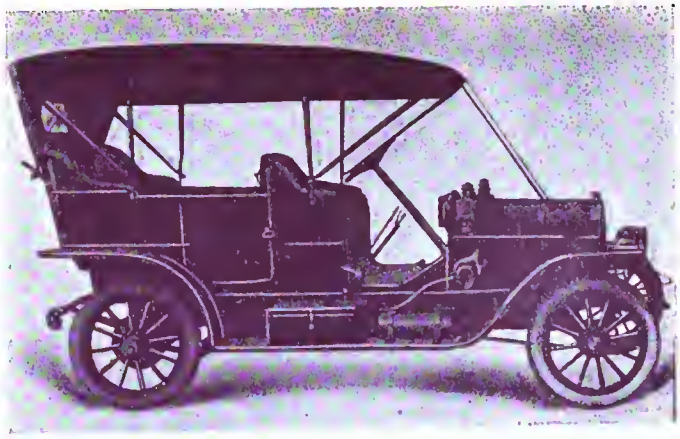
Berliet.—The Berliet, one of the only two foreign exhibitors to be at the show, is in four models for 1909. These consist of four chasses, equipped with all types of bodies, two of which, the 15-20 horsepower and the 20-30 horsepower, are shaft-drive cars, and the other two, rated at 40-50 horsepower, are chain driven. Three of these models have four-cylinder motors, and the fourth has a six-cylinder motor. All motors are of the same mechanical construction except that in the six-cylinder motor the cylinders are cast in threes, whereas in the four-cylinder the cylinders are cast in pairs, and in the 15-20-horsepower model the Thermo-syphon cooling system is used.

Clark-Hatfield.—The Clark-Hatfield motor buggy, built by the Clark-Hatfield Auto Company, Oshkosh, Wis., varies considerably from the general line of vehicles of this type, in that 39-inch wheels are used instead of the greater diameter. It also has the motor located transversely above the back axle, with a friction drive system ahead of the motor and final drive by chain to the solid one-piece rear axle. The motor, an opposed air-cooled one of the four-cycle type, has 4¼ by 4-inch cylinders cast with circumferential cooling flanges. The crankcase, made in the usual box type, has the crankshaft carried in the lower part, and the upper portion serves chiefly in the capacity of a cover and carries the camshaft. Particular care has been shown in the make-up of the motor, accessibility being kept in the foreground. The crankshaft, 1¾-inch in diameter, has Parsons white brass bushings 3⅝ inches long, all hand-scraped to size. Connecting rods are forty-point carbon steel provided for adjustment at the crankshaft end by five thin brass liners. The cylinders are bored, annealed, and finally surfaced by grinding and lapping. The cooling fins are thin and unusually deep, giving a total radiating surface of 3,600 square inches. Both sets of mechanical valves are of nickel steel, located in pockets on the upper side of the cylinder. The springs are set in pressed steel cups lined with asbestos and elevated from the cylinder walls to protect them from heat.

Columbus Electric.—The five types of electric vehicles manufactured by the Columbus Buggy Company, Columbus, O., are designated 1000, 1001, 1002, 1100 and 1202, fitted with Victoria and buggy top Stanhope, four-passenger brougham, and two or three passenger coupé bodies, respectively. Model 1000 has a multipolar type motor of about 2-horsepower and twenty-four cells of 9 M. V. Exide battery. This motor is set in an aluminum frame, fitted with annular ball bearings, and is provided with a noiseless transmission from the armature to the jackshaft, enclosed in an aluminum case. The controller is of the radial type and fool-proof. Drive to the rear axle is by means of side chains provided with mud guards. The steering gear is of the side lever type. The service brake operates on the shaft and is applied by a further movement of the controller after the motor is cut out of service, and the foot brake operates upon the rear wheel drums. The frame is of pressed steel, full elliptic rear, and half platform front springs are used; wheels are equipped with 30 by 3½-inch front and 31 by 4-inch rear tires and roller bearings. The wheelbase is 74 inches, and the car weighs 1,725 pounds. Model 1001 is the same, except that the body is fitted with a Victoria top. Model 1002 is the same as Model 1000, except that it has a two-passenger coupé body, with an extra child's seat, is inside driven and weighs 1,875 pounds. Model 1100 is also the same as Model 1000, except that it has an 86-inch wheelbase, 34 by 4-inch pneumatic tires, a 2½-horsepower motor, twenty-four cells of 11 M. V. Exide, weighs 2,250 pounds, and has a four-passenger surrey type body. Model 1202 has four-passenger coupé body, inside driven, 76-inch wheelbase, twenty-four cells of 11 M. V. Exide battery, 32 by 3½-inch front and 33 by 4-inch rear tires.

Dorris.—The Dorris car, manufactured by the Dorris Motor Car Company, St. Louis, is built with touring car, roadster, combination roadster and touring car, limousine and landaulet bodies this year, all on the same chassis, which is somewhat changed from that of previous years. The intake pipe is made of copper tubing instead of aluminum; the front engine hanger is changed so that the camshaft can be removed without removing the hanger; the clutch housing has been changed so that the crankshaft can be removed by taking off the gearbox only. The steering gear has been improved; the brakes are now operated by a cam and are lined with thermoid, and the wheelbase has been lengthened 2 inches by placing the cross spring at the rear on a bracket attached to the back cross member of the frame. The motor valves are in cages in the head and operated by means of rocker arms from one camshaft contained in the crankcase. The latter is a one-piece iron casting, with two large inspection plates on either side, held in place by a central yoke. Parsons bronze bearings are used throughout, and the connecting rods are drilled for the lubrication of the wrist pins. A mechanical oiler with six sight feeds, one for each cylinder and the two end bearings, is operated from the camshaft by means of an eccentric.

Duer.—The Chicago Coach and Carriage Company makes the Duer motor buggy, which is presented in practically the same design as last year, excepting that a larger motor is used, having a 4½-inch bore with 4-inch stroke, instead of the 4 by 4 type of last season. This motor is constructed to be interchangeable with the smaller size, which permits of buyers having an option on the horsepower when purchasing. The Duer has several characteristics, all of its own, one of which is the transmission used. The motor is air-cooled, located crosswise in front and lubricated from a two-feed mechanical oiler, one lead of which passes to the left cylinder and the other to the cam box where it feeds the two to one gear. The right cylinder is oiled entirely by splash. The reason of feeding an oil lead to the left cylinder only is that the latter is cared for by the splash from the crankcase which, owing to the rotation of the crankshaft, receives a greater quota of oil from this source than does the other cylinder. A change in the running gear of this car has been the strengthening of the axle as well as the wheels. The axles are now 1¼ inches square, and the wheels made with 1⅜-inch spokes instead of 1½. The use of 44 and 48-inch wheels gives the car an out-and-out motor buggy appearance.



Halladay Model D Touring Car with Top Complete.

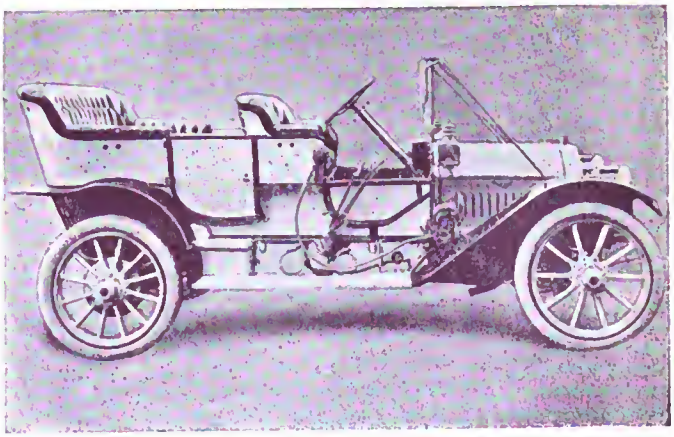
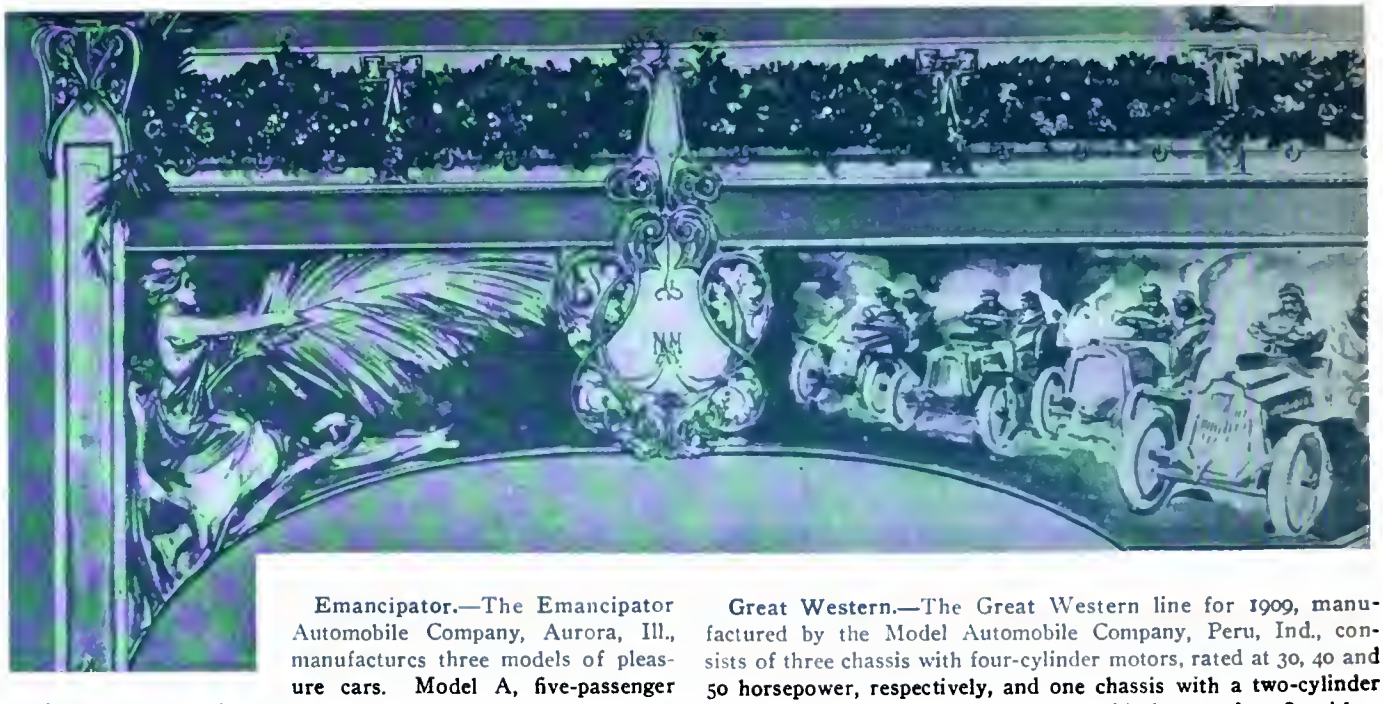
Great Western with a Body for Two Times Two.



Olds Touring Car with a Roomy Tonneau and Luxurious.



Emancipator.—The Emancipator Automobile Company, Aurora, Ill., manufactures three models of pleasure cars. Model A, five-passenger touring car, and B, four-passenger toy tonneau, and the Aurora runabout with rumble seat. These models have a four-cylinder multi-unit quadruple opposed motor, watercooled, and rated at 20 horsepower; a planetary three-point suspension transmission; floating type rear axle; 32-inch wheels; 3½-inch pneumatic tires and 100-inch wheelbase, but the Aurora model has a two-cylinder opposed motor, watercooled and rated at 16 horsepower, and three-quarter platform rear springs. The four-cylinder motor of the Emancipator models is located in front under the hood. The cylinders are cast in pairs, and the bases of each pair widen out to form the crankcase when the two pairs of cylinders are bolted together. The lugs by which the motor is suspended from the frame are also cast integral with the cylinder heads. The cylinders being of the L-type, all valves are located on the top side and operated by means of offset push-rods. The pistons are also cast in pairs with but one connecting rod for each pair; and the crankshaft of the two-throw type rests on two babbited phosphor bronze bearings. A cellular type radiator is used in connection with a thermo-syphon water-cooling system; ignition is by jump spark with battery and coil, and lubrication is by means of a five-feed mechanical oiler. The planetary transmission is equipped with babbit bearings, and fibre-lined steel bands acting upon pressed steel drums are used for low and reverse speeds while a cone clutch is used for high speed. The floating rear axle is equipped with Standard roller-bearings. The frame is of pressed steel; an irreversible steering gear with the tie-rod back of the front axle is used; and the brakes are of the internal and external type on the rear wheel drums.

Glide.—The Glide cars, manufactured by the Bartholomew Company, Peoria, Ill., are now built in two models, the new addition to the family being the Model R roadster. The Model G touring car is a refinement of the 1908 Glide, with but few changes. The fan is now placed on an adjustable bracket on the front cylinder; the front axle is dropped instead of straight; 4½-inch tires are used instead of the 4-inch; wider running boards have been fitted, and the steering gear, speed change, and brake levers have been improved. Both models are identical except for the difference in wheelbase, wheels, gasoline capacity, and the greater road clearance on the roadster. A four-cylinder Rutenber motor is used, of the vertical, water-cooled type with separately cast cylinders and valves all on one side, operated from one camshaft. The crankshaft is supported on five phosphor bronze bearings in the upper half of the case, which is of aluminum. The lower portion of the crankcase forms a reservoir for the self-contained oiling system.

Great Western.—The Great Western line for 1909, manufactured by the Model Automobile Company, Peru, Ind., consists of three chassis with four-cylinder motors, rated at 30, 40 and 50 horsepower, respectively, and one chassis with a two-cylinder motor which is a reproduction of the Model 14 of 1908, with a few minor changes, such as longer wheelbase, semi-elliptic springs in front in place of elliptics, and a high-tension magneto, which is now included in the regular equipment. The three models with the four-cylinder motors are practically the same except in length of wheel bases, sizes of tires, and spring suspension, the 50-horsepower car having semi-elliptic springs all around, but elliptic rear springs are used on the small models. The motor is characterized by its valve arrangement, the exhaust valves being located centrally in the top of the cylinder heads, and operated by means of rocker arms and push rods from the camshaft in the crankcase, while the intake valves are in the bottom of the valve chambers on the right side of the cylinders, and are operated from the same camshaft by means of adjustable lifters. The cylinders are separately cast with integral heads and water jackets and bolted on to studs which pass right through the crankcase to support the five bronze bearing caps of the crankshaft. The crankcase is of aluminum with a removable lower portion, and has two large inspection plates on either side, held in place by one central yoke for each pair. The crankshaft is heat-treated, ground and offset ½-inch. The water circulation is maintained by a gear driven pump located at the front of the motor on the left, and the magneto occupies the same position on the opposite side. An adjustable belt-driven fan, attached to the front cylinder, assists in the cooling. Double ignition is used, with magneto and battery. Lubrication is by means of a seven-feed mechanical oiler, which is rachet driven, and located at the rear, on the left side under the exhaust pipe. A cone clutch is used, faced with Rayhestos, with springs underneath to ease the engagement. Between the clutch, which is released through a ball-thrust bearing, and the transmission, is a double universal joint which allows of the usual sliding for disengagements. A selective gearset, giving three speeds forward, is carried on the same subframe which supports the motor, and Timken roller bearings support both shafts which lie in the same vertical plane. A floating type rear axle runs on ball-bearings, while the front axle is drop-forged of I-beam section with ball-bearing spindles. Annular ball-bearings are used in the wheels. The steering gear is of the worm and sector type; the main frame is of pressed channel steel, narrowed in front to reduce the turning radius, and the brakes are contracting and expanding on rear wheel drums. The two-cylinder car is equipped with an opposed motor located amidships on the left hand side, bringing the flywheel directly in the middle and the planetary transmission to the right.

Halladay.—In connection with its five- and seven-passenger, 40-horsepower touring car, the Streator Motor Car Company, Streator, Ill., is bringing out an entirely new model. The chassis of this new model may be fitted with either two-passenger roadster with artillery rear seat, surrey type or touring car bodies, and has a four-cylinder motor with cylinders separately cast, but having integral heads, waterjackets and valve chambers. The valves are on opposite sides and operated from two camshafts, with integral cams. The crankshaft is heat treated and ground, and Cramp's ship-metal bearings are used throughout the motor. Ignition is jump spark with storage battery and Bosch magneto as extra equipment. Lubrication is by splash in the crankcase, the level being maintained by means of a gear pump in the sump of the crankcase. A thermo-syphon cooling system is used with a vertical tube radiator, and a fan driven by belt from the crankshaft. The clutch of the multiple disk type, has twenty-eight metal disks. Drive from the clutch to the transmission, which is located on the rear axle, is through one universal joint, and a shaft enclosed in a torsion tube which is supported in front on lugs from a cross member of the frame. The transmission is of the sliding gear type with two forward speeds. Hess-Bright bearings are used throughout the transmission and Hyatt roller-bearings in the semi-floating rear axle. The frame is of pressed steel elliptic springs, being used in the rear, while the steering gear is of the worm and sleeve type with the tie-rod behind the axle. One set of contracting band brakes is provided, operated by pedal and acting on rear wheel drums. A number of improvements have been made on the Model D, 40-horsepower car, among which are a multiple disk clutch, selective sliding gear-set, the use of Hess-Bright annular ball-bearings throughout the gear-set and rear axle, and more room in the tonneau, owing to the lengthening of the wheelbase. The motor is of the Rutenber type. The crankshaft is supported on Cramp's ship metal bearings in the upper half of the aluminium crankcase. Lubrication is by splash, self-contained, the same as on the smaller car. Provision is made for the attachment of a Bosch high-tension magneto in connection with storage battery system.

Meteor.—The Meteor line, built by the Meteor Motor Car Company, Bettendorf, Ia., comprises two models, Type F, a seven-passenger touring car, and Type F1, a baby tonneau car. The same chassis is used in both, except that in the roadster model the steering column is tilted more towards the horizontal. A Fedder's square tube radiator is used and is set back on the frame 2⅝ inches, making the hood that much shorter. The Eisemann ignition system has been replaced by the Bosch dual system with the cylindrical coil and switch located on the dash. The fender design has also been slightly changed. These cars have a four-cylinder motor rated at 40 horsepower, a selective gearset, and are shaft-driven. A rather unusual appearance is given to the motor by the square cylinder trunks which rest upon the aluminum crankcase. These cylinders are cast separately with the valves on opposite sides, operated from camshafts contained within the crankcase. In order to reduce the length of the motor, as well as to facilitate casting, the front and rear faces of the water jackets are cut away and rectangular plates fitted. The crankcase is divided horizontally in two parts, the crankshaft being carried on five bearings in the upper section. The forward gears are contained in oil-tight housing. Use is made of hand-buffed aluminum pipes for intake and exhaust gases as well as for both intake and outlet water pipes. The intake and exhaust manifold are similar, and the water connections are at the top side of the valve chambers instead of in the cylinder heads. The magneto is located on the right side just back of the rear cylinder, and driven through a shaft from the forward gear-housing, and the five-feed mechanical oiler, located in the same position on the opposite side, is driven in the same manner. A multiple-disk clutch of the regular alternating disk type with an easy method of adjusting the clutch tension, is fitted. The gearset is carried in a one-piece casting, the front end of which is removable.

Mier.—The Mier Company, Ligonier, Ind., has four models for 1909 with runabout and surrey bodies. Models A and B are practically the same except for a few changes in regard to body construction. The chassis has a two-cylinder, water-cooled motor rated at 12.8 horsepower, A.L.A.M. Ignition is jump spark with storage battery. A tubular radiator is used in the cooling system. Lubrication is by means of a mechanical oiler. These cars have friction drive to the jackshaft and side chains to the rear wheels. An angle iron frame is used and brakes are of the expanding type. The wheelbase is 86 inches and solid or pneumatic tires may be fitted to the wheels, which are 30 inches in front and 32 inches in the rear. Models C and D are identical with Models A and B, except for body changes, and larger motors.

Oldsmobile.—The output of the Olds Motor Works, Lansing, Mich., for 1909 will consist of eight models built on four different chasses. Models D, toy tonneau and touring car, and DR, flying roadster and detachable toy tonneau, are built on a chassis with 112-inch wheelbase, 34-inch wheels, equipped with 3½ and 4-inch tires, full elliptic rear springs, and a four-cylinder motor rated at 40 horsepower. Model X Special has 106-inch wheelbase, 32-inch wheels, 3½ and 4-inch tires, three-fourth elliptic rear springs and a four-cylinder motor rated at 35 horsepower. Models Z, touring car and runabout, have a 130-inch wheelbase, 36-inch wheels, equipped with 4½ and 5-inch tires, full elliptic rear springs and a six-cylinder motor rated at 60 horsepower. Model 20, the least expensive of the line, has a 91-inch wheelbase, 30-inch wheels with 3½-inch tires, full elliptic rear springs and a 22 horsepower motor of the four-cylinder type. The six-cylinder chassis is of the same general characteristics excepting that the parts are designed for the extra work to be done, and in other ways the "six" is in conformity with the requirements, and it represents degrees of flexibility such as will please users.

Pittsburg Six.—The Pittsburg Six cars are made by the Ft. Pitt Motor Car Company, New Kensington, Pa., in three models—a three-passenger roadster with disappearing rumble seat, a four-passenger roadster, and a seven-passenger touring car, all with practically the same chassis, excepting that for the seven-passenger touring car some frame changes are made to accommodate the larger body. Of particular interest in the Pittsburg six-cylinder chassis is the use of separately cast cylinders with opposite valves. This year a new style of intake manifold has been adopted. It is of the loop variety, in which a horizontal pipe gives off a lateral branch to each cylinder, this pipe being parallel with the feeding pipe of the same length from the carbureter uniting with it by end loops, so that the mixture leaving the carbureter travels in both directions through the feeder pipe. The mixture thus travels the same distance to each cylinder, part going in one direction and part in the other. The motor has shown a greater speed range since the adoption of this manifold. Another change this year is the employment of a Hele-Shaw multiple disk clutch which supersedes the cone type of former years. This clutch is of the regular Hele-Shaw type with corrugated disks, but incorporating certain changes which the American licensee has seen fit to make for American needs. A further change is the employment of vanadium steel in the rear axle, to which might be added a line of general improvements in many small details on the car. The Pittsburg Six motor for all three chasses is made with cylinders having 4¾-inch bore and 5¼-inch stroke, and is rated at 54-72 horsepower. According to the A.L.A.M. formula, is 54.6 horsepower. The cylinders are bored and ground to finish, the crankshaft revolves on seven bearings, and the valves have nickel-steel heads electrically welded to mild steel stems. The crankcase, cast in upper and lower halves, makes use of the lower as an oil reservoir in conjunction with splash lubrication.

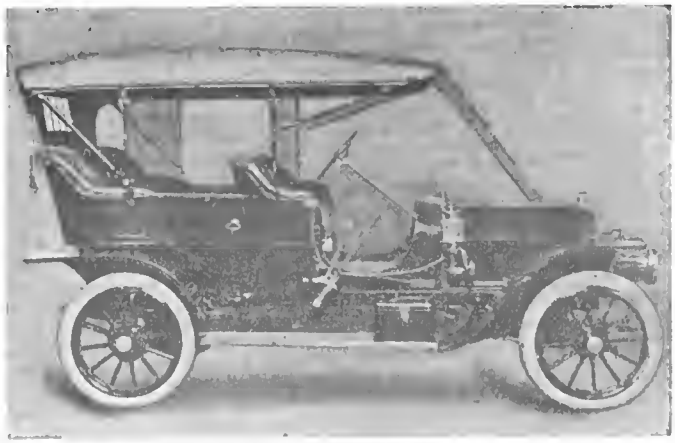
Popular Pittsburg Six Known as Model D.

Rider-Lewis Touring Car Rides on Scroll Elliptics.



Auburn Touring Car with a Canopy Top and Room.

Rambler.—The major efforts of Thomas B. Jeffery & Co., Kenosha, Wis., will be on four-cylinder cars, but a couple of two-cylinder types are also being marketed. The four-cylinder chasses are alike in design, but vary in size and constructive strength. They are known as models 44 and 45, the former a 34-horsepower chassis with cylinders 4½ inches square and fitted with five-passenger body; and model 45, a 45-horsepower chassis with 5 by 5½-inch cylinders and seven-passenger body. In addition, however, both chasses are fitted with roadster and toy tonneau body style, and the company is manufacturing closed body types. The Rambler chassis contains several improvements over the 1908 type. The location of the timer at the right front of the motor has been improved by raising it, resulting in increased accessibility. The use of the magneto in conjunction with the batteries results in a complete dual system. The Rambler roller contact timer is used in which the wires remain stationary during any advance or retard of the spark. A change in the lubrication system is that the oiler is mounted lengthwise and further to the rear than last year. In the new location, its accessibility is increased and the capacity has been increased 50 per cent. The water pump is now located back of the transverse tubular support at the front end, and in this new location is entirely separate from the half-time gear housing. An important improvement in the selective gearset is that the two shifter rods are carried in a boss in the right side of the case, one being a rod and the other a surrounding sleeve. On the rear end of each is a short arm with ball ending, with which the shifter mechanism attaches. A change in the clutch is the discontinuance of the balanced type of inverted cone heretofore used and the adoption of a direct cone with a 50 per cent. greater friction surface.

Randolph.—The Randolph motor truck is a new Chicago product, manufactured by the Randolph Motor Car Company, and is somewhat exclusive in its lines, in that it is designed for a 1,250-pound load and combines in its make-up a transmission system not common in vehicles of this capacity. Its chassis contains a two-cylinder opposed motor mounted transversely in front and transmission from this is through a planetary gearset of the conventional disk and wheel type, the wheel mounted on a cross jackshaft on the ends of which are sprockets for driving to the rear wheels. The car, built with an 80-inch wheelbase, and 34-inch front and 36-inch rear wheels, is well adapted for light delivery purposes and is built with enclosed bodies of wire screen or panel variety. Most notable is the dropping of the frame at the front end, which lowers the center of gravity to some extent and makes it possible to use a fairly large friction disk without encroaching upon the load-carrying space. The front of the frame is supported on semi-elliptics in the usual manner, but full elliptics do service in the rear, supporting the frame through trunnions. A differential gear is used on the cross shaft carrying the friction wheel, and when engaging the friction wheel with the friction disk the jackshaft is not carried forward as so frequently done in friction constructions, but the disk is thrust rearward against the wheel. The motor rated at 22 horsepower, uses conventional waterjacketed cylinders with valve chambers, so that the valve springs, etc., are accessibly located. The cylinders bolt to opposite sides of the crankcase and end plates are used for the bearings, which does away with the splitting of the case. The top is a removable plate, and when off discloses the valve mechanisms. Cooling is by thermo-syphon, the water course being from the radiator base to the motor.

Franklin Straight Front Brougham for Town Service.

Columbus Electric for Town Car Service.

Richmond.—The Richmond line for 1909, manufactured by the Wayne Works, Richmond, Ind., consists of three models—J-1, J-2, and J-3—all of which have the same chassis construction with a few minor exceptions, such as length of wheelbase, size of tires and motor. Model J-1, a runabout with a detachable rumble seat, has an 88-inch wheelbase, 3-inch tires, and a motor rated at 22.5-horsepower. Model J-2, a runabout with a double seat in the rear, has a 96-inch wheelbase, 3½-inch tires, and a 22.5-horsepower motor. Model J-3, a light touring car with baby tonneau, has 102-inch wheelbase, 3½-inch tires, and a motor rated at 25.6-horsepower. The motors in these cars are all of the same L type, four cylinders, vertical, air-cooled, with integrally-cast heads, valve chambers and cooling flanges. Valves are all mechanically operated from one camshaft. The intake valves are located in the top of the valve chamber, and are operated by means of rocker arms, and the exhaust valves, located in the bottom of the valve chamber, are operated direct from the lifters below.

Ricketts.—The Ricketts Automobile Works, South Bend, Ind., are manufacturing three models on a standard chassis. These cars are fitted with baby tonneau, five-passenger touring, and three-passenger roadster bodies. The prominent features of this chassis are the unit power plant with its three-point suspension, six-cylinder, water-cooled, valves-in-the-head motor, multiple-disk clutch, selective gearset, propeller shaft with one universal joint enclosed in a torsion tube, the straight-line drive, and the floating-type rear axle. The cylinders of this motor are cast in pairs and the valves are all operated from one camshaft contained within the crankcase. The flywheel is located in front of the motor and the gearbox is bolted on to the rear end of the crankcase. At the front of the motor between the flywheel and the crankcase is a transverse shaft, driving the water pump on one end and the U. & H. magneto on the other. The timing gears at the forward end are contained in the crankcase proper. At the rear end the gearset is designed with the mainshaft above the countershaft and the multiple-disk clutch is carried within the gearbox housing. The clutch and brake pedals are attached directly to the gearbox housing. Double ignition is used with two sets of plugs, dry cells, Heine coil and magneto. Lubrication is self-contained with a gear-driven double-gear pump to circulate the oil.

Rider-Lewis.—Three models, all built on a standard chassis with a six-cylinder water-cooled motor, comprises the 1909 line of the Rider-Lewis Motor Car Co., Muncie, Ind. These cars are equipped with five and seven-passenger touring, four-passenger toy tonneau, or two and three-passenger roadster bodies. Although they are designed along the lines of conventional construction, they have a number of distinguishing features, the most striking of which is the design of the motor. The cylinders are separately cast with integral spherical-shaped water jackets; the valves are contained in cages in the heads, a little to the right and left of the center, and are operated by means of rocker arms from an overhead camshaft centrally located along the tops of the cylinders. This camshaft is driven by means of double gears and a vertical shaft in front of the motor, the cams and rocker arms being protected by an aluminum housing. The crankcase is of one-piece construction into which the crankshaft is assembled endwise, and closed in by end plates.

Staver High-Wheeler.—The Staver Carriage Company, Chicago, is marketing one model of motor buggy for 1909. It is of the three-passenger roadster type with a four-cylinder motor rated at 22 horsepower, multiple-disk clutch, a sliding-gear transmission, 92-inch wheelbase, and 38-inch wheels equipped with 2-inch solid tires. These cylinders are cast separately with integral heads, valve chambers and water jackets; valves are on opposite sides and are operated through pushrods. The crankcase is of aluminum and of two-part construction, supporting the crankshaft in the upper half, the lower portion forming the reservoir for the self-contained oiling system, the oil circulation being maintained by means of a gear-driven, gear pump. The thermo-syphon cooling system is used in connection with a honeycomb radiator; and ignition is jump spark with storage battery, and Bosch high-tension magneto as extra equipment. The sliding gear transmission is located on the rear axle and equipped with ball bearings.

Owen Thomas.—The Owen Thomas Six, manufactured by the Owen Thomas Company, Janesville, Wis., makes its first appearance in the field of high-class automobile competition this year. After 2 years of trying out parts, making jigs, tools, templates and gauges to produce interchangeable parts in quantities, the Owen Thomas company is now offering one type of chassis equipped with either seven-passenger touring, five-passenger roadster, or two or three-passenger runabout bodies. The power units are all the same and include all operating levers, pedals, etc., independent of body or frame, the variation in wheelbase affecting only the length of the torsion tube and drive shaft. The engine and transmission form a unit power plant all working parts of which are encased, run in oil and are supported on three points. By loosening a few nuts, the body with the rear axle and torsion tube can be wheeled back, leaving the power plant on the front axle and all parts of the engine and transmission accessible.

The crankshaft is a patented construction, cut from a solid billet of hammer-forged oil-tempered Vanadium steel with ground bearings. Instead of the ordinary crank arms, hollow disks are used between the crank pins; these disks are a little larger in diameter than the outside of the pins. The crankcase being of one-piece construction, is bored out so that the crankshaft with its bearings can be inserted through the rear of the case. The transmission case is bolted to a flange on the engine case to form the unit power plant. On the front end of the crankshaft is bolted a spiral gear from which the valves, generator, oil pump, fan and fuel pumps are driven. All gears used in the motor are of the spiral type. Rotary valves are used doing away with all springs, cams, pushrods, etc. One valve is placed in the head of each cylinder supported on ball-bearings.

A direct-current generator of special design is driven from the forward end of the crankshaft and supplies current for the ignition and lighting systems, besides keeping the storage batteries full charged. The batteries are also used in starting the engine. No distributor or timer is used in the ignition system, both of these functions being performed in supplying fuel by direct injection into the cylinders. For exterior cooling, a cast aluminum fan forces air against the outside of the cylinders. The clutch is of the expanding ring type and runs in oil, the ring being of bronze and expanding into the rim of the flywheel.

Zimmerman.—The Zimmerman Mfg. Co., Auburn, Ind., has four models for 1909, one of which, Model G, a motor buggy type, has a double disk friction transmission and the other three, Models H, I and K, runabout, surrey and three-passenger roadster, are all fitted with planetary transmissions. The motors on these buggies are all of the same mechanical construction, but differ in dimensions and horsepower. All are air-cooled with two opposed cylinders of the L-type, which are offset and bolted to the cast-iron crankcase. The valve chambers and cooling fins are integrally cast and the valves, which are contained in detachable cages, are operated by pushrods from a single camshaft contained in the upper portion of the crankcase. This upper portion is removable with the pushrods and camshaft intact. The crankshaft and connecting rods are steel forgings and fitted with bronze bearings of extra length. Lubrication is by means of a mechanical oiler; ignition is jump spark with vibrating coil on the dash and dry cells. The carbureter is of the float feed type and a ball-bearing roller-type commutator is used. The large fan flywheel materially assists in the cooling. The frame is of angle steel; and whereas the springs on Model G are of the full elliptic type, two in number, those of the other models are of the three-quarter scroll type, four in number, and attached to each corner of the frame. The brakes are of the expanding type on the rear wheels and operated by pedal.

TREND IN TRANSMISSION PRACTICE

By Thos. J. Fay

IN the automobile's early days steam steam engines are so flexible as mission gearset. In steam motors i direction of motion, and as a result t tomobiles did not contemplate the use as it will be found in automobiles of t

When the internal combustion gasoli it was soon found that to reverse m disadvantages in divers ways. Powe the inferior timing relation which mu was designed to suit reversing conditi plications were introduced into the v any case, it would be necessary to ad motor by the use of gearsets, it would to the valve motion anything by wa since an addition to the gearset woul the end would be adequately served.

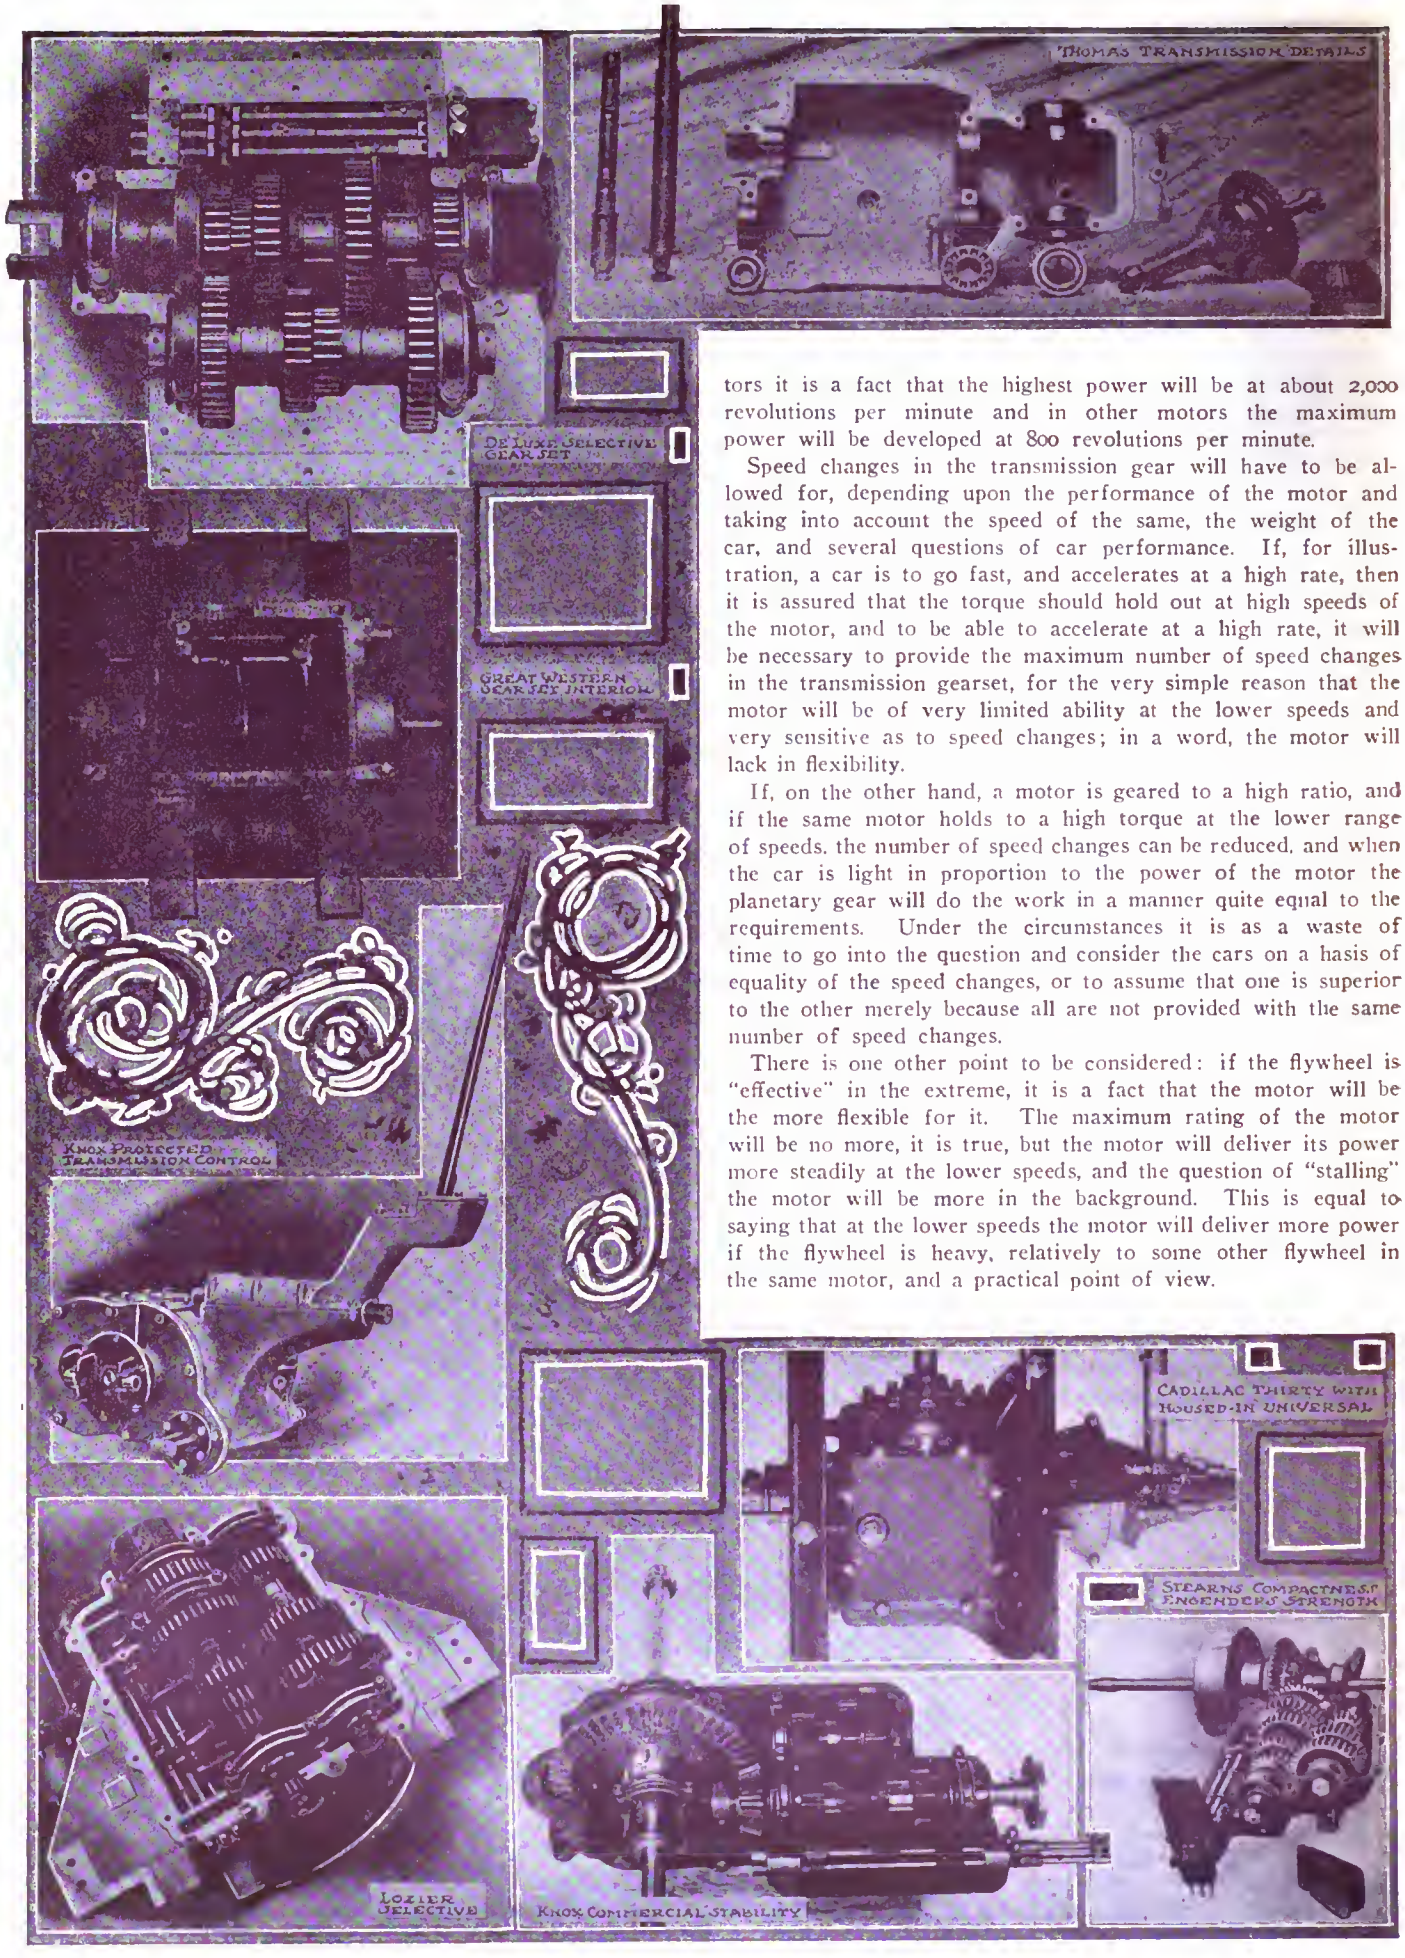
The present status of the devices u motors as used in automobiles for the best results came as the product of mu many failures of methods which seem sence of experience. Of course m abandoned. True, the theory of "ma was the lack of proper application o the earlier failures, or indifferent su

The ideas of the present are in fu of "machines," and the results are leave little to be desired. That th to be done is conceded, but they are activity of the industry broadens.

Some Basic Considerations

If motors could be so designed a torque with decreasing speed, and c considering speed, all would be well, could be eliminated. As it is, taking motors at the several speeds, nothing ered. It is a well-established fact t certain proportion up to say 20 mil speed the wind resistance begins to b point on the power must be increas effect of the wind resistance, which be At very low speeds torque becomes of for illustration, if a car is plowing its sarily slowly, it is low speed and high

Taking the motor performance alc torque falls off as the speed decreases the torque also decreases as the speed increases above a certain point. In a word, the torque of a motor is not in conformity with the requirements of the car, either at the low or the high speed. This is not to say that all motors perform in a like manner in this respect. Some motors will deliver power at higher speeds than will others, due to the shape of the torque curve—which can be influenced by the design—to a very considerable extent. In some mo-

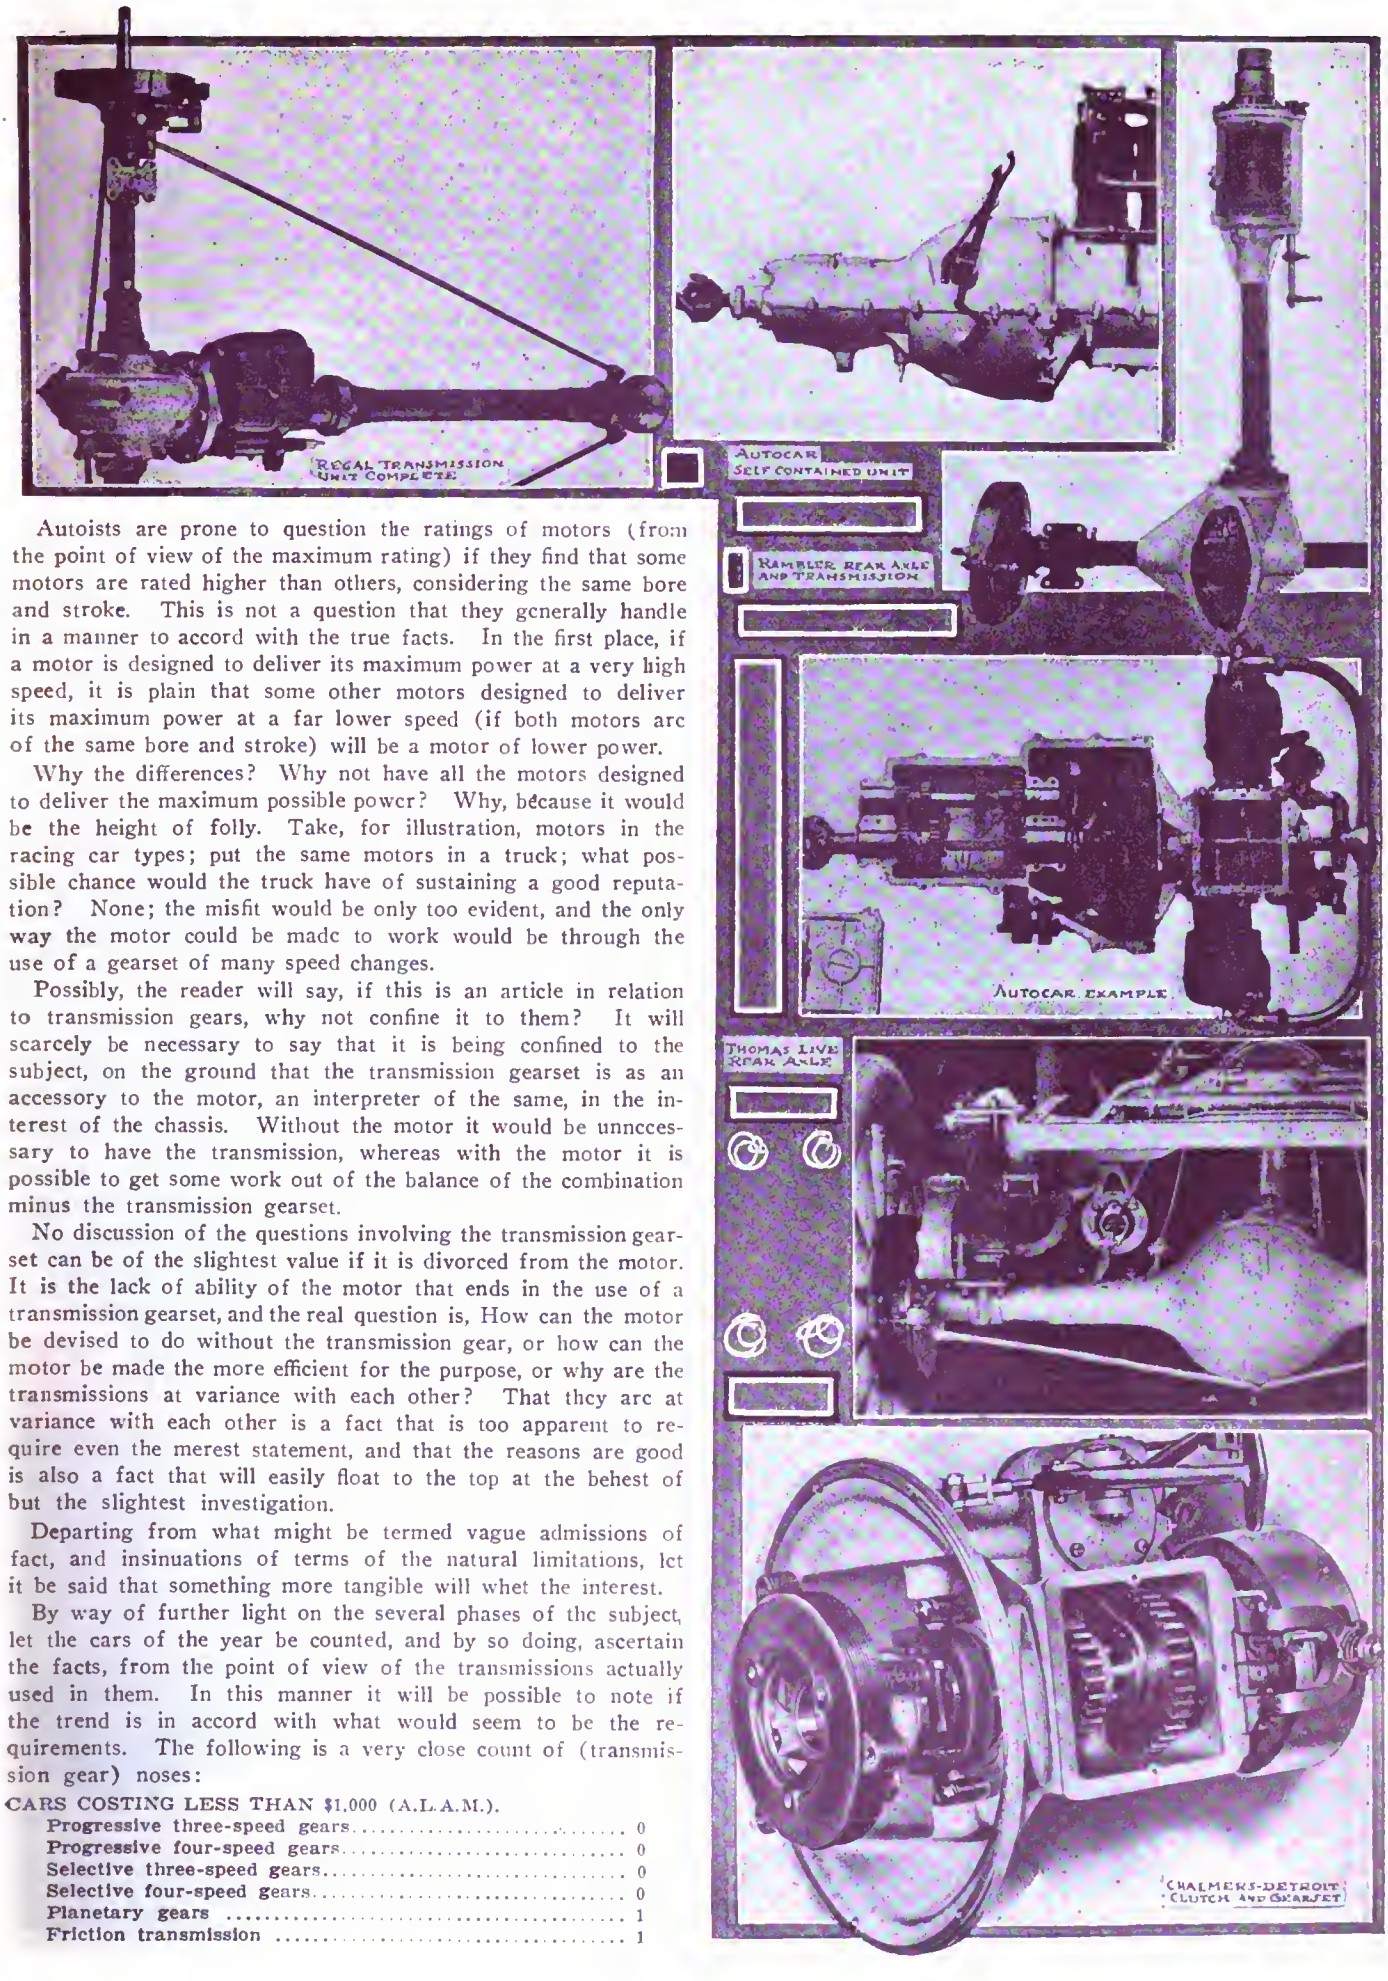


tors it is a fact that the highest power will be at about 2,000 revolutions per minute and in other motors the maximum power will be developed at 800 revolutions per minute.

Speed changes in the transmission gear will have to be allowed for, depending upon the performance of the motor and taking into account the speed of the same, the weight of the car, and several questions of car performance. If, for illustration, a car is to go fast, and accelerates at a high rate, then it is assured that the torque should hold out at high speeds of the motor, and to be able to accelerate at a high rate, it will be necessary to provide the maximum number of speed changes in the transmission gearset, for the very simple reason that the motor will be of very limited ability at the lower speeds and very sensitive as to speed changes; in a word, the motor will lack in flexibility.

If, on the other hand, a motor is geared to a high ratio, and if the same motor holds to a high torque at the lower range of speeds, the number of speed changes can be reduced, and when the car is light in proportion to the power of the motor the planetary gear will do the work in a manner quite equal to the requirements. Under the circumstances it is as a waste of time to go into the question and consider the cars on a basis of equality of the speed changes, or to assume that one is superior to the other merely because all are not provided with the same number of speed changes.

There is one other point to be considered: if the flywheel is "effective" in the extreme, it is a fact that the motor will be the more flexible for it. The maximum rating of the motor will be no more, it is true, but the motor will deliver its power more steadily at the lower speeds, and the question of "stalling" the motor will be more in the background. This is equal to saying that at the lower speeds the motor will deliver more power if the flywheel is heavy, relatively to some other flywheel in the same motor, and a practical point of view.



Autoists are prone to question the ratings of motors (from the point of view of the maximum rating) if they find that some motors are rated higher than others, considering the same bore and stroke. This is not a question that they generally handle in a manner to accord with the true facts. In the first place, if a motor is designed to deliver its maximum power at a very high speed, it is plain that some other motors designed to deliver its maximum power at a far lower speed (if both motors are of the same bore and stroke) will be a motor of lower power.

Why the differences? Why not have all the motors designed to deliver the maximum possible power? Why, because it would be the height of folly. Take, for illustration, motors in the racing car types; put the same motors in a truck; what possible chance would the truck have of sustaining a good reputation? None; the misfit would be only too evident, and the only way the motor could be made to work would be through the use of a gearset of many speed changes.

Possibly, the reader will say, if this is an article in relation to transmission gears, why not confine it to them? It will scarcely be necessary to say that it is being confined to the subject, on the ground that the transmission gearset is as an accessory to the motor, an interpreter of the same, in the interest of the chassis. Without the motor it would be unnecessary to have the transmission, whereas with the motor it is possible to get some work out of the balance of the combination minus the transmission gearset.

No discussion of the questions involving the transmission gearset can be of the slightest value if it is divorced from the motor. It is the lack of ability of the motor that ends in the use of a transmission gearset, and the real question is, How can the motor be devised to do without the transmission gear, or how can the motor be made the more efficient for the purpose, or why are the transmissions at variance with each other? That they are at variance with each other is a fact that is too apparent to require even the merest statement, and that the reasons are good is also a fact that will easily float to the top at the behest of but the slightest investigation.

Departing from what might be termed vague admissions of fact, and insinuations of terms of the natural limitations, let it be said that something more tangible will whet the interest.

By way of further light on the several phases of the subject, let the cars of the year be counted, and by so doing, ascertain the facts, from the point of view of the transmissions actually used in them. In this manner it will be possible to note if the trend is in accord with what would seem to be the requirements. The following is a very close count of (transmission gear) noses:

CARS COSTING LESS THAN $1,000 (A.L.A.M.).

The following recapitulation of the cars of the A. M. C. M. A. shows that the three speed selective system has taken a hold of the industry in a way to be called vigorous to say the least. An inspection of the transmission gears as here illustrated will show a very decided compactness, especially in connection with the progressive types, more particularly of the three speed designs, many of which are "direct on high," which is also a strong factor for compactness and stability. This question of rigidity is one which will be better understood when the designs of the gear-spindles are taken into account a little later. Obviously it is an advantage to have the members quite as short as possible, for then the bending moments will induce less flexure, and the dynamic life of the members will be increased.

RECAPITULATION WITHOUT RESPECT TO PRICE (A.M.C.M.A.).

Progressive three-speed gears	8
Progressive four-speed gears	4
Selective three-speed gears	118
Selective four-speed gears	16
Planetary gears	0
Friction transmissions	0

Considering all the cars of the makes in the two associations, of which knowledge is available, the situation without respect to price is as follows:

RESUME OF THE STATISTICS OF GEARSETS OF ALL MAKES.

Progressive three-speed gears	21
Progressive four-speed gears	7
Selective three-speed gears	177
Selective four-speed gears	50
Planetary gears	24
Friction transmissions	13

Considering some 292 automobiles, the approximate percentage situation is as follows:

Progressive three-speed gears	9.2 + per cent.
Progressive four-speed gears	2.4 — per cent.
Selective three-speed gears	60.6 + per cent.
Selective four-speed gears	17.1 + per cent.
Planetary gears	8.2 + per cent.
Friction transmissions	4.4 — per cent.

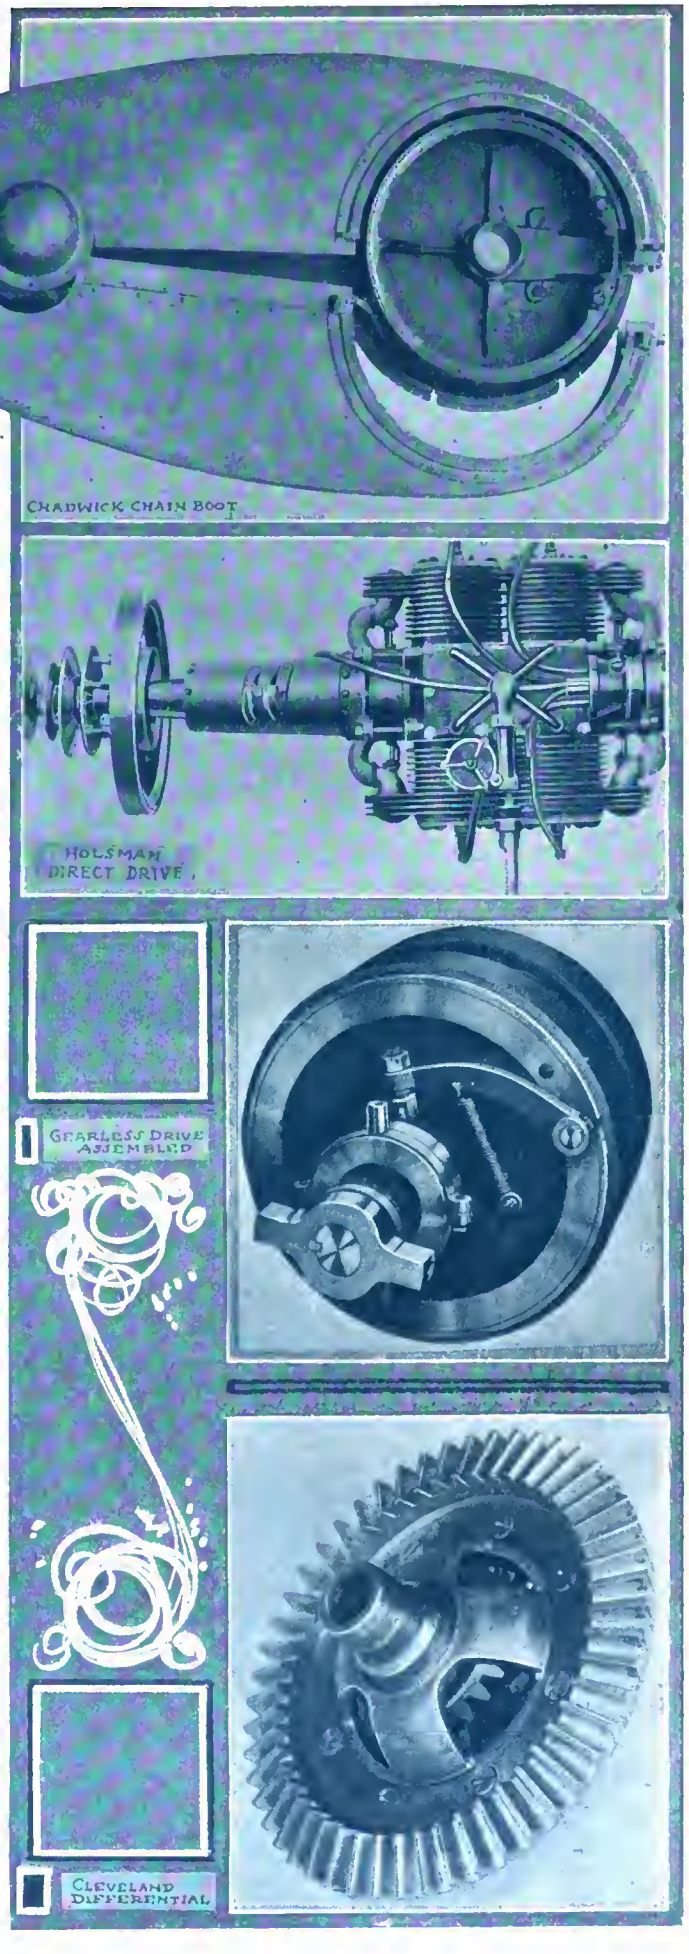
Comment in relation to the percentages of the respective classes of transmissions in actual use is as a waste of time, but it will be worth saying that there has been a decided shift, in that the time was when progressive four-speed gears predominated. In view of the fact that these transmission gearsets took up much room, and weighed overmuch, they have been eliminated in many cases, despite the fact that there are properties in the progressive system that made many friends. As it is, the chances are that the several systems have been reduced to good practice, taking into account the point of view, which is everything in automobile work.

In the progressive system it is true that less skill is required when it comes to accelerating a car, since it is necessary to throw in the low gear first and progress to the high gear. This is at the expense of a little time, and the motor is enabled to pick up. If, on the other hand, it is the selective system that is used, the operator can be mistaken as to the gear to use, unless selections are made in regular increments, from the low gear to the high, without skipping any available gear.

Since it is but a matter of a little skill to be able to select the most suitable gear ratio in any case, many of the experienced drivers take kindly to the selective system. The only way by which the question becomes annoying is when an autoist who has been using one of the systems finds himself in possession of a car equipped in the other way. It naturally will take a little time to get used to the change.

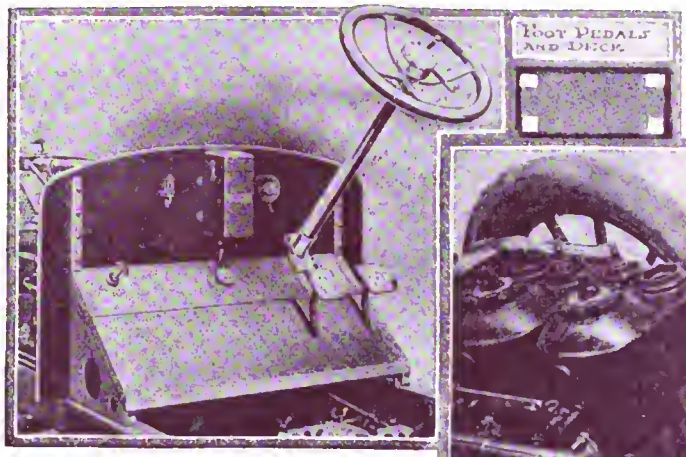
Materials Suitable for Use in Transmission Gears.

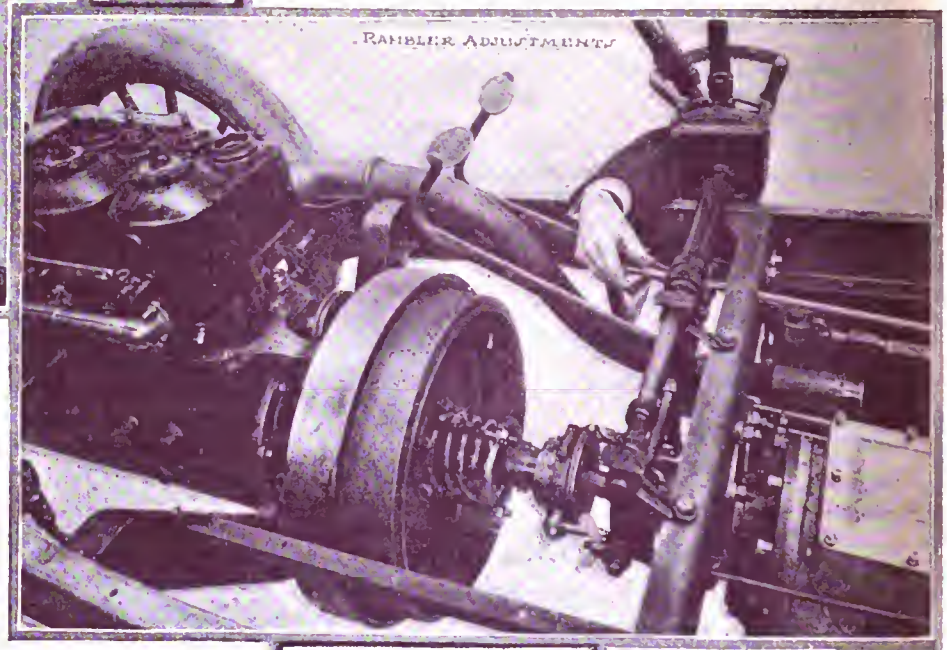
This is a branch of the work which must receive the most careful attention if it is to be attended with notable results. A fairly detailed discussion of this phase of the subject may be in order in view of the general advances made in connection with the automobiles for the year, rather with the idea of show-

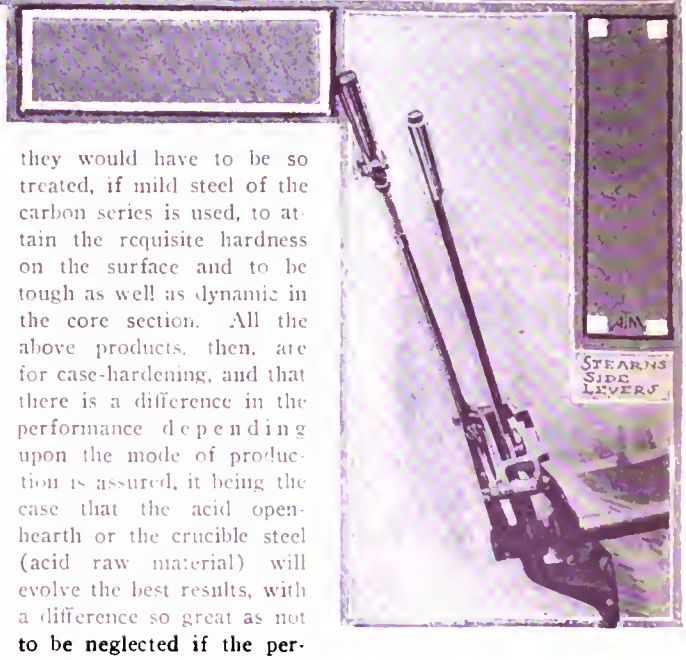


ing the extent of the advances, with the further notion of affording information to those who may need it, and that buyers of cars will really be able to see why the question of the relative cost is not one which can show on the surface. The other side of the question is one in which it is intended to show that the cost of the material is not to be the sole criterion.

That the quality of the material to use must be disposed of before the design is fixed upon, is assured; it would be as a waste of time to lay out a structure on a basis of the use of steel and then substitute lead for the steel; and yet there is fully this difference between the superior grades of steel as used in gears and the ordinary run of steel as it is offered in the marts of trade. There is much uncertainty in the haunts of designers when it comes to this matter, for the reason that the vendors of steel have opinions in relation to quality which are so flexible as to stretch in all directions, depending upon the information disclosed by the "stock sheet."







The illustrations afforded with this article will adequately disclose the great uniformity which obtains in practice when reference is had to the gear dimentions; there is a great uniformity; it is to be expected, for reasons as follows:

(a) The gear ratios are very much the same in the several makes of cars of the respective classes;

(b) Motors are very close together in point of power in the several makes of cars of the same class;

(c) Road conditions are equal for all the makes of cars;

(d) The duties of the gearsets, in the several makes of cars of a common class, do not differ from each other to any great extent.

Since the conditions are very closely approximated in the various cars of the several classes, it is a fair assumption that the gears will have to do about the same amount of work, and it is the "factor of safety" which will be altered if the materials are not the same, assuming gears of precisely the same design. True, it is possible to introduce many variations, and in point of detail, many are the variations in actual practice. Equally true, there are limitations to all, limitations, in fact, which, if not taken into account, will terminate the performance in disaster in the cases which do not conform to the torque requirements.

Special Grades of Carbon Are Used.

The materials used in gears may be classed in the manner as follows, as they are used in cars of the present time:

(a) Mild carbon steel of the acid open-hearth genera;

(b) Mild carbon steel of the basic open-hearth genera;

(c) Mild carbon steel of the Bessemer genera;

(d) Mild carbon steel of the crucible genera.

In the above grades of steel the carbon is kept below the point at which quenching from above 900 degrees centigrade will cause any noticeable hardness. The limit is 20 points of carbon, and it is generally conceded that 16 points of carbon should be the maximum if the gears are to be "cemented" (case-hardened); they would have to be so treated, if mild steel of the carbon series is used, to attain the requisite hardness on the surface and to be tough as well as dynamic in the core section. All the above products, then, are for case-hardening, and that there is a difference in the performance depending upon the mode of production is assured, it being the case that the acid open-hearth or the crucible steel (acid raw material) will evolve the best results, with a difference so great as not to be neglected if the performance is to be noteworthy.

PROPERTIES OF CARBON STEEL OF VARIOUS COMPOSITIONS.

Composition (acid open-hearth steel).

Number.	Carbon.	Silicon.	Sulphur.	Phosphorus.	Manganese.
1.....	0.132	0.026	0.031	0.055	0.400
2.....	0.183	0.037	0.024	0.052	0.710
3.....	0.311	0.040	0.021	0.052	0.575
4.....	0.370	0.062	0.021	0.029	0.800

PHYSICAL PROPERTIES.

(Heated to 610 deg. Centigrade and cooled in air.)

Number.	Tensile Strength Tons per Sq. In.	Elastic Limit Tons per Sq. In.	Elongation Per Cent. in 6 Inches.	Reduction of Area in Per Cent.	Brinell Hardness Number.
1.....	25.35	12.33	30.60	62.65	78.1
2.....	30.20	15.58	27.70	60.70	96.1
3.....	33.09	13.96	24.10	55.32	102.0
4.....	35.63	17.53	22.03	52.82	111.0

(Report of W. F. Harboard, Feb. 20, '08. Paper read before the Institute Mechanical Engineers.)

There is no other grade of carbon steel suitable for use in gears if "cementing" is to be resorted to excepting that the remaining contents can be varied over considerable ranges, and the "heat treatment" can be conducted in divers ways.

(To be continued.)

Quakerville Has a Good Show

By G. M. Schell

PHILADELPHIA, Feb. 3.—To-night the Philadelphia show closed with a most satisfactory accounting all around. The attendance has been excellent, interest has been plainly apparent, and sales have followed as a natural sequence. There is no doubt but that the exhibition has been of great material benefit to the industry in this city, and the general impression prevails that a Winter show is still an asset worth the trouble and expense for several years to come.

Made up of 66 separate exhibits—of which 42 are of automobiles, 4 of motorcycles and 20 of accessories—the show was really the most comprehensive ever held in Philadelphia. Fifty-two of the better-known American and foreign cars were crowded under the armory roof, the actual number of cars on exhibition being 154.

The color scheme was a daring departure from the tenets of the "quiet and dignified"—nothing less than nile green and pink, if you please. But perhaps that combination isn't a winner! It gave the big armory the effect of the interior of a huge square tent, the central roof feature being a huge staff device dotted with myriads of electric globes, with long strings of lamps carried therefrom to every side and corner of the armory, while immediately above were looped alternate strips of nile green and cerise material, so closely draped as to entirely hide from view the unsightly girders of the roof. These strips were carried from above the huge central electric device to the far sides and ends of the building, giving the tent effect spoken of. Opposite the main entrance debouched into the main aisle, which was lined on each side (placed at booth intersections) with staff columns in Byzantine period effect, each opposite pair connected by a graceful lattice work arch entwined with beautiful artificial flowers. This lattice work effect was repeated around the sides of the entire armory, giving a general effect, which, while decidedly effective, was not garish. Kendle's string band, perched on a hanging balcony at the far end of the armory, could be heard but not seen, being ensconced in a veritable floral-electric bower. Manager Beck came in for unlimited compliments on the decorative scheme—even the exhibitors and visitors on business bent being forced to admit the compelling effect of beautiful surroundings in a venture where the great desideratum in the final analysis is the almighty dollar.

While it had been the original intention, owing to the lack of space, to limit the exhibits to automobiles and accessories, the pleas of the motorcycle makers became so insistent that at the eleventh hour Manager Beck decided to secure one of the large main-floor company rooms to accommodate them. Here, to the right of the main entrance, was the "Motorcycle Annex," and four rivals for the "two-wheeler" business hold forth here with fifteen machines of various power and price. They were the Reading, Standard, Thor, Marsh-Metz and N. S. U.

The lack of the exhibition room was impressed upon the visitor from the moment he entered by the crowding into the corridor at the left of the entrance of a single specimen—but a most beautiful one—of the handiwork of the Woods Motor Vehicle Company, of Chicago. It was a coupé fitted up with every luxury and convenience, and on McKinley's birthday it was fairly smothered in pink carnations. Despite the uptown location of the armory and the distance from the hotel, wholesale and automobile districts in the center of the city, the show exceeded by 50 per cent. all previous attendance records for similar exhibitions held in this city. Manager Beck figured out on Saturday night, the fourth of the show, average daily admissions of nearly 8,500, which, in view of the narrow aisles—necessitated by the clamorous demands for space and more space—made uncomfortable crowding a nightly occurence. Indeed, even the afternoon crowds were so comparatively dense as to

push the overflow into the various stands and interfere somewhat with the conversation artists connected with the various displays getting in their best licks. However, the real business of the mornings and early afternoons more than compensated for the evening discomforts, and there were few dissatisfied exhibitors. All hands know the handicap under which Philadelphia show promoters have long labored, and "if we only had a Madison Square Garden here" was often heard from visitor and exhibitor alike.

Like all modern automobile shows, real novelties were conspicuous by their absence. But there was "something new" at the Philadelphia show, whether it is practical or not. It is the Carroll carbonic acid gas car. Mounted on a runabout frame of about the 1905 vintage, the little engine for which the inventor claims 31 horsepower, looked insignificant indeed. The utter simplicity of the engine is accentuated by the absence of radiator, carbureter, sparking devices, and all the other necessities which go to make up a complete gasoline car chassis. And yet, Mr. Carroll claims he has harnessed C O2 until it will do his will. A peculiar feature of the Carroll exhibit was that there was no "conversation corps" to dilate on the merits of the invention—and Lord knows one was needed, despite the fact that a neat little booklet was handed out at the stand which answers possibly a third of the questions asked concerning it! No attempt was made to secure purchasers or subscribers to stock. The exhibit stood there for the crowds to look at, feel of—smell, if they cared to—and that was all there was to it. That it "goes," hundreds of Philadelphians are willing to swear. What makes it go they are not so sure of. Perhaps this show has launched a revolutionizer. *Quien sabe?*

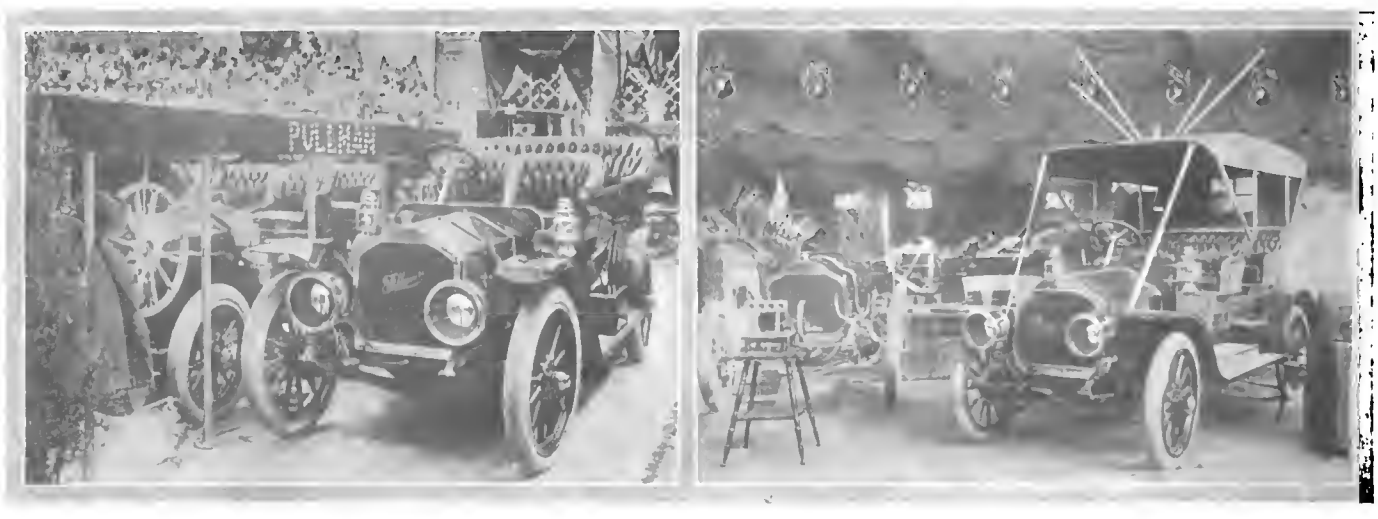
Every exhibitor whose product has captured trophies on track or road had his plunder displayed prominently. The Fiat had its $5,000 Savannah Grand Prize cup. At the Matheson stand proudly among other trophies reposed the $600 MacDonald & Campbell cup, captured on the heart-breaking Wilkes-Barre run of the Quaker City Motor Club. The Acme exhibit's main feature in the prize line was its second place in the Fairmount Park Founders' Week race, the Locomobile crowd going them several better, with the cups symbolical of first place in the same contest and its still greater win in the Vanderbilt race. A veritable forest of small cups crowned the Pullman exhibit; a similar display being a marked feature also of the Stanley exhibit—and so on. The little "Lampo" was the star card at the Lancia booth, the triumph of Hilliard at Savannah having been supplemented only recently by Mrs. Cuneo's win in the same little car on the run of the Women's Motor Club, of New York, from the metropolis to this city and return. The dust and mud-begrimed transcontinental Brush was also in evidence, the car being carefully watched in order that none of the apparently precious grime of travel should be accidentally removed.

The show early promised to be as successful as a business proposition as it was pleasing to the eye. Not in the sense that it proved a money-maker for the promoters—for that was a foregone conclusion before the doors were opened last Wednesday night—but that exhibitors as a rule found their expenditures for space and the extras well worth while. Possibly the biggest bit of business done was the closing of a deal between the Autocar Company and the Pennsylvania Taxicab Company, whereby the former will furnish 25 vehicles for the latter for use in this city. Wayne Davis "sneaked one over" on his fellows when, fifteen minutes after 8 o'clock on Wednesday night, he recorded the first actual sale of the show—a replica of the Matheson, which won the Philadelphia-Wilkes-Barre endurance of the Quaker City Motor Club. After that sales were numerously reported, scarcely a single exhibitor being overlooked.

Every day saw an influx of national automobile celebrities; it would have been impossible to shy a brick at random anywhere into the crowd without bringing down a star card. All of the elect, who put in the first days of the week storing up energy after the exhaustion following the Garden show and preparatory to the further demands upon them next week at Chicago, floated into town to tune up a trifle at the expense of the Quakers. Publicity men, sales managers, factory experts and manufacturers—place them in any order you please—were here. Fred L. Estey, in his inimitable interviews with himself, garnered column after column of dollar-a-line space gratis for the E-M-F, the local sheets snapping it up with avidity. Ernest Coler became so warm over some of his cracks that he fell into the trap and helped the game along. Beginning in fun and dealing at first in generalities, Estey brought around his ears a bunch of competitors with defies in their pockets, blood in their eyes and chips on their shoulders—and laughingly skipped the town. E. L. Thomas, Harry Fosdick, "Dunc" Curry, C. S. Jamison, W. C. Churchill, H. B. Larzalere, R. H. Johnston, Lee Counselman, E. P. Nussbaum, W. H. Kirkpatrick, "Major" Humphries, Frank Pearce, George Bennett, "Senator" Morgan and "On-the-Spot" Spooner were just a few of the celebrities who spent the first half of the show in town.

The heavy storm of Tuesday night, previous to the opening of the show, deprived the visitors of the opportunity of witnessing the free-moving picture exhibition, which the management had provided as a side-show to the star attractions in the main tent. A huge tent had been erected on the vacant lot next the armory, but Old Boreas put in his most vicious licks and ripped the tent to pieces. Fortunately, the moving picture machine was not injured, but it was found impossible to secure another tent on such short notice, and this feature was reluctantly abandoned. It was perhaps just as well, for with a blizzard on Saturday night and intensely cold weather during the latter part of the show, it would have been impossible to properly warm the tent. Thus did Dame Nature thwart dire pneumonia.

Despite environs and conditions of inclement weather, Philadelphia has done it, and the "straws" are scattered to the "four winds" of solid business, some of which is in hand.



THE apparent popularity of the town car is a definite measure of its value in the service to which it is dedicated. Of town cars it may be said that a considerable variation in types of bodies, or, better yet, in body designs, will be found. The limousine type of body is largely used in town work, the landaulet is sometimes employed for the purpose, but the brougham type represents comfort and luxury in the extreme.

Of the limousine, and the advantages thereof, roominess is the most pronounced feature. This style of body is preferred by the patrons of the industry whose needs are by way of a spacious body, seating five persons within. In all other respects, the limousine type can be rendered just as comfortable and possess all the elements of luxuriousness possible of attainment in connection with the brougham.

The landaulet, on the other hand, has for its basis an entirely different set of features. With the landaulet, it is possible to take advantage of the clemency of weather by folding back the collapsible top and avoid thereby the cooped-in feeling, so prone to grow upon one if the atmospheric influences favor open-air life. There is no lack of comfortable surroundings or luxuries in connection with the superb designs of landaulet, to be seen at every hand, and in them the seating capacity is not less than in the limousine types, excepting that the auxiliary seat requires the occupants to ride backward, as a rule.

This question of seating capacity is secondary in town cars, for, in all truth, they are not intended to serve in the capacity of a carry-all. Indeed, there is a decided preference, when it comes to the brougham type, in favor of limiting the seating capacity to two persons and no more. In the brougham type of town car, utilized as it is by way of a convenience in social life, there is a distinct disadvantage if the seating capacity does not exceed that which will afford a liberal accommodation for two persons. "Her ladyship" in transit for the opera is not costumed with the idea of being sandwiched in between two persons, nor is it feasible to utilize auxiliary seats, for the reason that the entrance would be obstructed under conditions that are most disagreeable.

The town brougham affords a commodious and luxurious seating space for two persons, which in itself would be of no advantage at all in the absence of a wide entrance, free from obstructions of every character. On this account it is the custom to make the depth of the chauffeur's seat not more than 18 inches at the most; his foot room is reduced to approximately 20 inches, lengthwise of the car, and the preference is for the short motor; again with a view of rendering the space within the maximum possible without bringing the seats of the occupants over the rear axle, which is an advantage in this service.

In the best examples of town cars, the turning radius of the car is taken into account in practically every case. It is desired to be able to maneuver in congested streets, and to make a turning movement in fairly narrow thoroughfares, without having to back and fill, as it were. In this we see a still further reason for a short wheelbase, which in turn indicates very little room for the chauffeur's seat, the least possible for the motor, and the balance for the body proper, that luxury may repose within.

The wheelbase can scarcely be more than 100 inches, if the turning radius is to be half the width of thoroughfares as they generally do obtain. This in itself would scarcely suffice for the purpose, in the absence of a limited "canting" angle, of the front wheels, and this angle depends not only upon the diameter, but upon the width of the chassis frame in juxtaposition to the front wheels. These are all matters that now receive their quota of attention, while in former times it was considered that a touring car chassis could be fitted out for town car service, hoping to render it fit if perchance the body was a luxurious creation, with room enough in the seating space to dance the minuet.

Not so with the modern creations. They are town cars pure and simple, designed specifically for the purpose, and are limited to town service, since, forsooth, they would be as faulty for touring as is the touring car when converted over. Likewise in the town car there is a penchant in favor of the shaft drive, since by the elimination of the side chains the sprocket-wheel guard will not obstruct the side entrance or take up space on the running board. In the expression of this preference in favor of the shaft drive, there is naught by way of questioning the mechanical ability of chains, nor does this preference indicate a more pronounced condition of stability of the shaft drive. It is a mere case of prejudice upon the part of the patrons who do not care to have the side entrance obstructed in any way.

Town Cars Are Heavy.

Criticisms of weight may be well taken when aimed at light touring cars, or cars in which high speed is a perquisite, but in a town car weight is an essential to that "Pullman" effect so much to be desired. But if weight is a favorable factor (which will, of course, run up the tire account), the weight must be placed where it will do the most good, *i. e.*, as near the ground as possible. "Top hamper" would cause lateral rolling and engender other ill effects, as pitching in the longitudinal plane. The modern town car body, then, is designed with stout under-framing and light, even to frailness, in the over-body. The chassis is also, as a rule, much heavier than would be necessary in a touring car, or other pleasure automobile. The wheels are not of a maximum diameter, and the ground clearance seems to be adequate under the conditions of service of the town cars, and it brings the running board at a nice elevation in relation to the customary stepping stones; which running board, in turn, is well situated with respect to the sill of the side entrance.

In spite of the desire for weight in town cars, they are not

with great power of the motor, because they do not have to negotiate unpaved streets, nor are they noted for high speed. In some town cars, weighing perhaps two gross tons, the power is even down to 16 to 20-horsepower. There seems to be no trouble on this account, while there is a factor in favor of economy in the directions as follows:

(a) The fuel consumption is remarkably low.
(b) The tire bills are minimized.
(c) The upkeep factor, due to shock, is less than it otherwise would be.

These are important matters and properties of the most recent types of town cars realized, without having to consider the absence of any innovation worthy of the name, since the speed attainable is all that can be used in the thoroughfares.

The Accessories of Town Cars.

Headlights are not included with the equipment of town cars, since ethically there is nothing in favor of blinding the pilots of approaching vehicles, merely to cast a glare where none is necessary; the lighting system, then, is complete with side-lights and a tail-lamp, conforming to the legal requirements. When reference is had to the signal system of a town car, a positive but not conspicuously noisy signal, free from trinkets, should be included.

But the occupants of the car will ever find it necessary to indicate to the chauffeur the direction in which to go, how fast to travel, when to start and when to stop. A speaking tube or a telegraph is therefore essential to the equipment, and an annunciator is placed to intercept the line of vision of the chauffeur, which in itself is an electrical device, as a rule, with drops suitably inscribed. Within the body of the best types of town cars will be found a time-piece, and a *secretaire* with paper, envelopes, and such little trinkets as lend zest to luxury.

The Vagaries in Design.

There are no finishes in connection with the carriage makers' craft so pronounced in artistic effect or varied as to detail as will be found in conjunction with the town car. The lines of the body in the best examples are at the hands of artists of no mean repute, and it is not uncommon to see samples of town cars in which the body alone reaches to the comfortable figure of several thousand dollars. Unappreciative persons of no experience, to whom the shadow of a dollar exceeds the purchasing ability of the coin itself, would scarcely see in these marvelous creations any whit of their real worth or the embellishment of true art and stability personified.

It has been so from the beginning in the automobile zone of activity. No sooner did designers sink into a groove than some new and improved plan bounced off the horizon and fell upon them with convincing force. Take, for illustration, the "taxicab," which in all truth is but a fitting evolution of the town car. It is the town car for the resident and the taxicab for the transient, and nothing short. It will not be out of place, then, to intimate that the taxicab was one of the offshoots of the experiences with town-car work.

Some Influences of Town Service on Cars.—Prior to the introduction of the town car as a type, and for some time thereafter, it was the custom to use the regular stock chassis, the body changing. Murmurs of discontent were soon to be heard, due to the akwardness of the side entrance, and the fact that the sprocket guard was in the way. The shaft drive car was the solution, by means of which the sprocket guard was eliminated, and the drop frame rendered the distance from the "curb" suitable for the purpose. In relation to the drop frame it is a fact that it did not stop with the "town car," and in the course of events it was found that the idea had value for other reasons than the mere fact that the side entrance of the town car was made more accessible. Predictions that the drop frame would prove weak and valueless for the purpose were as chaff before the wind in the light of even a little experience, for, in all truth, the drop frame proved to he more than equal to the occasion. In other words, this type of frame was found to have a wider range of usefulness, in that it afforded a superior car performance in many cases and in divers ways. With the drop frame it is possible to realize the "straight-line drive," which in itself is a matter of more than a little moment. The universal joints that formerly sustained serious hardships are in a straight-line drive enabled to perform their normal functions without having to transmit under conditions involving an undue angle.

The drop frame has had its influence upon the center of gravity and as a result the car performance under severe road conditions. This is a matter to be viewed in the light of reduced cost of maintenance rather than with the idea of engendering a greater speed. In the matter of appearance it is assured that the drop frame has had a marked effect on cars, nor can it be claimed that the change has been for the worse. The earlier types of cars looked as if something was missing; the drop frame had a lot to do with the discovery of the missing link. In some cases the whole frame is lowered rather than offset the frame, as in drop-frame construction. The practical result is the same in any event, since the center of gravity is lowered and the car performance is very much improved as a direct result. The frames are more substantial than was the case in the earlier days, and the materials used are superior for the purpose. Sag is aborted in some cases by inducing an artificial sag, in the process of manufacture.

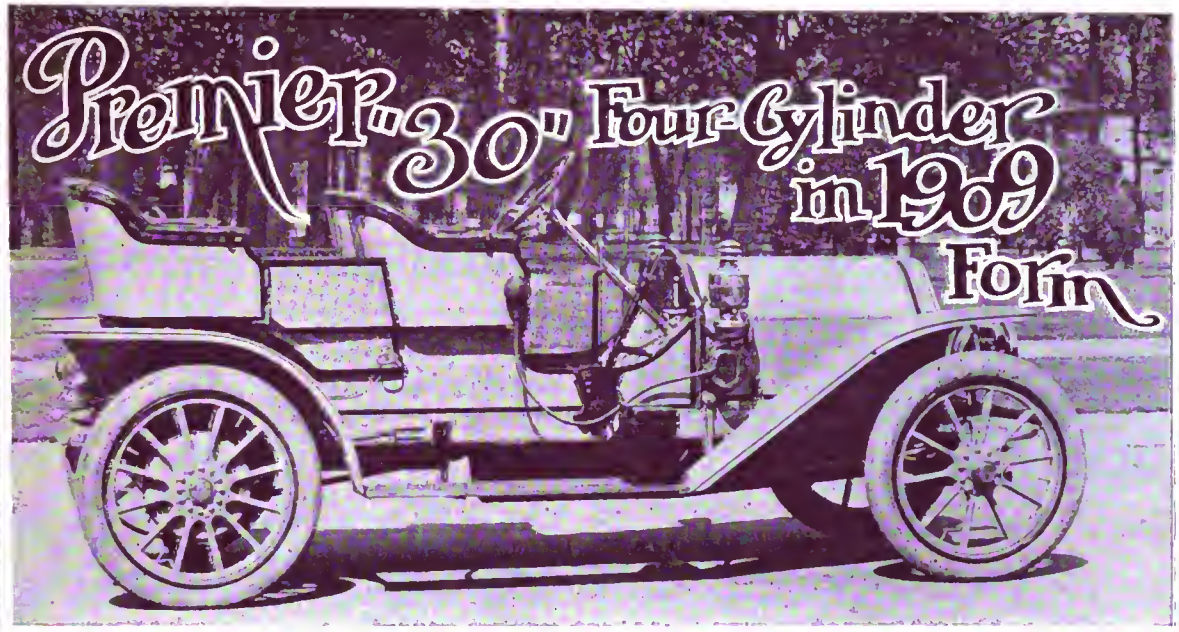
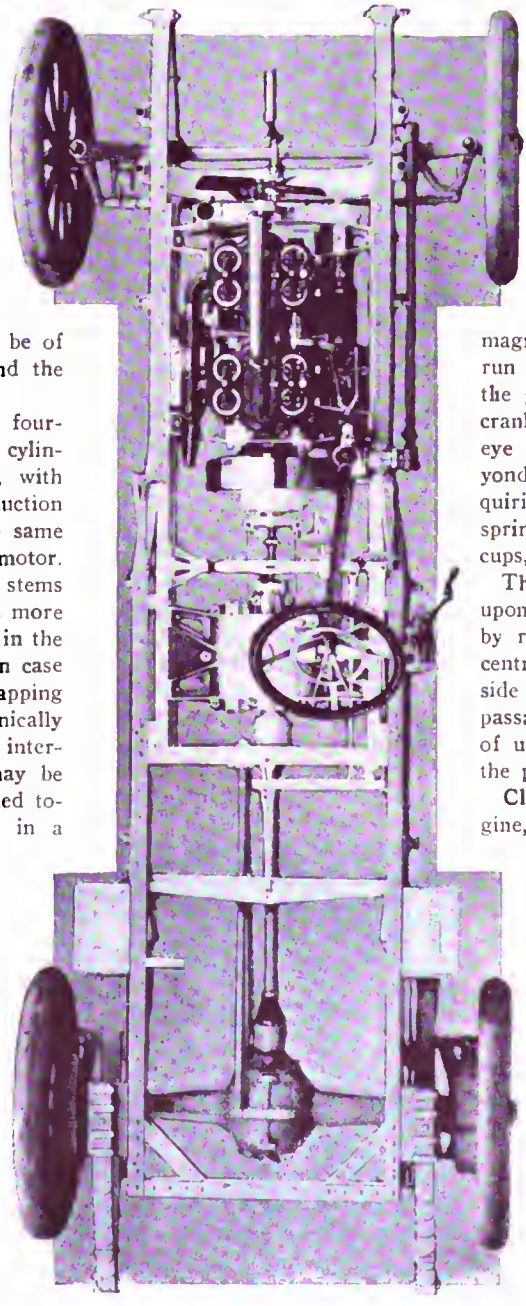
Premier "30" Four-Cylinder in 1909 Form



INDIANAPOLIS, Feb. 1. — Clean, straight lines, rounded out with a few well-chosen curves, characterize the 1909 product of the Premier Motor Manufacturing Company. This will consist of two models, a four-cylinder rated at 30 and a "six" nominally called 45. The former, or 30, may be had in four body styles, a single or double-seated roadster, double roadster with doors, touring car and limousine. All body work will be of the now general straight-line design and the material, sheet metal.



Power Plant.—This consists of a four-cylinder unit of exclusive design. The cylinders are of gray iron, cast in pairs, with valves on opposite sides and the induction pipe integral. Bore and stroke are the same at 4 1-2 inches, this being a "square" motor. The nickel-steel valves have both the stems and seats ground to size, which requires more expert workmanship. The valve guides in the cylinders are bushed to allow removal in case of wear rather than necessitating the scrapping of the cylinder. Both valves are mechanically operated, of a liberal diameter and interchangeable. Another feature which may be mentioned is the four piston rings, pinned together in pairs, each pair being used in a single groove. The crankshaft runs on three large bearings of Parsons white bronze, as do also the I-section connecting rods. A new departure of some moment is the use of cast iron for the crank case, aluminum being rejected as not rigid enough for holding the crankshaft and not suitable for thread cutting.

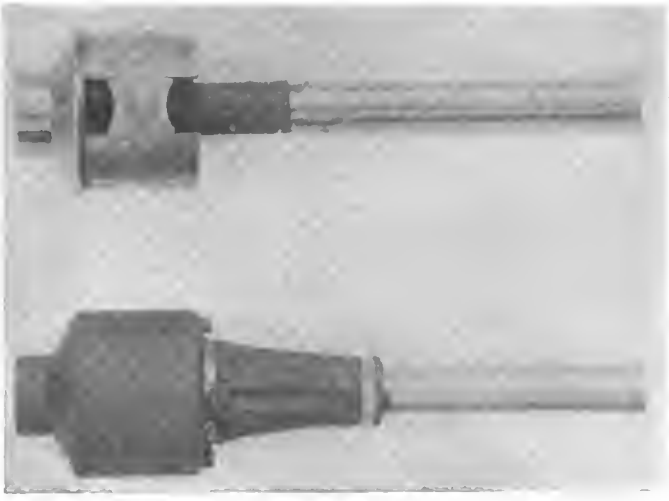
Make-and-Break Ignition. — The mechanical sparking device, so successful in previous years, has been retained. A low-tension Bosch magneto located on the right-hand side is the source of current, being driven through a universally jointed shaft which allows quick removal and replacement. The ignition cams, shown in the view of the cylinder, are driven from spiral gears on the inlet camshaft by means of a vertical shaft, broken by a three-jaw coupling and running on annular ball bearings. A second or auxiliary system is provided consisting of a battery, special single-coil and a high-tension distributor.

The motor is lubricated by a force feed lubricator located opposite to the magneto and gear driven. From there leads run to each cylinder, the main bearings and the gear case, but the lubrication within the crank case is of the splash type, a round bull's-eye in the case indicating the oil level. Beyond the motor itself, all parts of the car requiring lubrication, including springs and spring shackles, have liberal grease or oil cups, accessibly located.

The radiator is of the cellular type mounted upon rubber buffers and fastened to the frame by reinforced brackets. A large gear-driven centrifugal pump, located on the left-hand side of the engine, circulates the water, but all passages are liberally designed with the idea of utilizing thermo-syphon circulation in case the pump fails, to do the work.

Clutch and Transmission.—From the engine, the drive is through a multiple disc clutch of the Weston type to a three-speed and reverse transmission.

This clutch takes hold very gradually and thus avoids severe shocks. Universal coupling is interposed between this and the transmission. The latter operates on the selective principle in an H-segment and has direct drive on the high gear. The gear shafts are hardened, ground, and mounted upon imported annular bearings. The view with the cover removed shows the compactness of this. The drive to the rear axle is by shaft, a pair of Premier combination slip and universal joints taking care of all inequalities. These joints are of very large diameter and



Combination Slip and Universal Joint on Premier.

provision is made for a large amount of longitudinal slip.

The Axles.—The rear axle housing is made of two ball-shaped crucible steel castings, heavily ribbed on the inside, in which it shows a departure from conventional practice. With this construction the use of truss rods is avoided and a very strong combination results. The bearings are all of the annular ball type and the driving is done by means of large diameter three-jaw clutches forged integral with the axle spindle. The front axle is on a line with the front end of the radiator. It is a one-piece drop forging of very deep I-beam section and the material is a very tough special steel. The spring seats are forged integral and machined to size. In the selection of the springs, always a vital point, the greatest care is used. The type is the semi-elliptic front and three-quarter "ell" rear, these being of an unusual grade of spring steel. The leaves are thin, wide and individually lipped, besides which rebound clips are fitted.

The frame is really in two parts, the main or body frame and the sub or power-plant frame. The former is of a pressed steel channel section with very wide top and bottom flanges, and tied together by channel-shaped cross-stiffeners, the sub frame, which extends from the forward cross brace to the rear end and of the transmission, is of an angle section securely riveted to the inside of the main frame.

Brakes.—Not the least important part of any car are the brakes and the braking system. On the Premier 30 these are of two kinds, internal expanding 3 inches wide by 14 7-8 inches in diameter with 44 cork inserts, 1 1-8 inches in diameter pressed into 3-4-inch holes. This makes a brake that is right and will do the work at all times. The external brakes are of the contracting band type, lined with camel's hair belting and applied through a long pressed steel equalizer, as is also the foot brake. External adjustment is provided on both.

All told, this chassis reflects credit on its designers and should be as successful as it predecessor. The price of Type 30, with any body, is $2,500, except the Limousine, which lists at $3,500. A fitting companion for the "30" is Type 45, which may be had in the same styles of body work. The price of these is $3,500 up to the Limousine, for which $4,750 is asked. Thirty-four-inch wheels are regularly fitted on all models, the tires being 3 1-2 and 4-inch on the runabout, 4-inch all around on touring cars, while on the 45's, 4 and 4 1-2-inch sizes are used.

SOME MICHIGAN AUTO-MAKING STATISTICS.

DETROIT, Feb. 1.—Figures gathered from authoritative sources prove interesting as showing how Detroit and Michigan have forged to the front in the production of automobiles until there is in reality no second. In Detroit alone there are fifteen companies that manufacture automobiles, aside from the parts makers. These fifteen companies will this year turn out 50,000 cars—actual, not press-agent figures. These run all the way from a runabout at $500 up to seven-passenger cars that sell for $5,000 or more, according to the tastes of the buyer. Cars ranging from $1,200 to $1,500 form a great majority of this number, and with the former figure as an average, it will be seen that the local output will have a sale value of $60,000,000.

Scattered throughout the State, chiefly within a few miles of Detroit, are ten more factories that will produce many thousands of cars this year. Within eleven years a dozen of these concerns have trebled their capital stock, until now they have more than $6,500,000 to their credit. A careful canvass shows that in Michigan more than $50,000,000 is invested.

RAINIER PLANT MAY RESUME.

SAGINAW, Mich., Feb. 1.—Further advices received here indicate that the Rainier automobile plant will continue operations in this city. George C. Comstock, the company's attorney, has bought for $20,000 at public auction all of the company's plant, machinery, unfinished product, etc., not covered by the $100,000 mortgage, including also the company's equity in the mortgaged property. Besides being attorney for the company, Mr. Comstock is a director, and it is believed that with this purchase, and that of A. T. Ferrell, a Saginaw man, of the company's $100,000 bonds, all conflicting interests have been harmonized.

THIS ONE HAS PERPETUAL MOTION ALSO.

SAVANNAH, GA., Feb. 1.—A resident of Valdesta, near here, J. J. Pittman by name, has practically perfected an automobile run by compressed air generated by the machine itself. After working on it for many years he has now satisfied himself of its practicability and his patent attorneys have assured him that the invention will solve the perpetual motion problem. Doubtless with a few slight modifications this same machine can be used to transmute the baser metals into gold, square the circle, and generally clear up all of those old and time-worn problems I

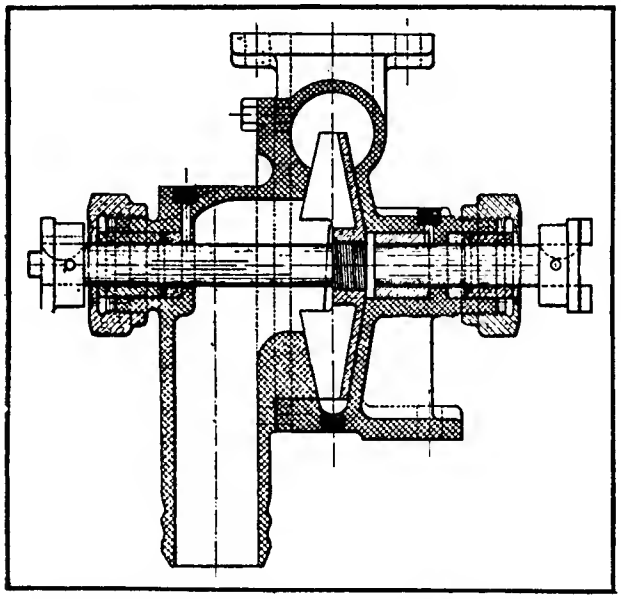
THE NEW MATHESON "SIX" FOR 1909

WILKES-BARRE, Pa., Feb. 1.—The newest addition to the Matheson line, the baby, so to speak, while showing the dominant Matheson features and workmanship, also shows a few departures more in keeping with up-to-the-minute practice. This new car is a six-cylinder, the first to be regularly produced in the Pennsylvania factory. Rated at 50 horsepower these 4 1-2



The Matheson's Powerful Gear-Driven Centrifugal Pump.

by 5 inch cylinders are fully up to the standard set by their older brothers. Strength and power is the Matheson keynote, and in the latest production of Designer Kenen this is upheld.

The motor, in common with the rest of the car, shows a few changes. Thus, the cylinders are cast in pairs. On the other hand, the valves in the head have been retained, these being of large diameter, mechanically operated and interchangeable. They are operated from a single camshaft on the right side, this being enclosed within the crankcase, and having cams milled out from the solid. From this to the overhead rocker arms the motion is transmitted by the long tappet rods. Former practice placed both pipes, inlet and exhaust, on the left, but on the present model the exhaust remains, while the inlet and carbureter have been removed to the right side. The latter is similar to the carbureter used on the large model.

Crankshaft Discs Increase Flywheel Effect.

The crankshaft is a one-piece forging with the flywheel flange forged integrally. This has two large discs for perfect balancing forged with it and runs on bearings of anti-friction bronze. The aluminum crankcase is of the box type and forms a solid pan from the radiator to the back of the flywheel. The lower section is the reservoir for the oil used in the auxiliary splash and lubrication of the main bearings. This is cast with compartments for each cylinder and is removable for access without disturbing the bearings or other parts. The gear-driven fan is mounted on imported annual bearings.

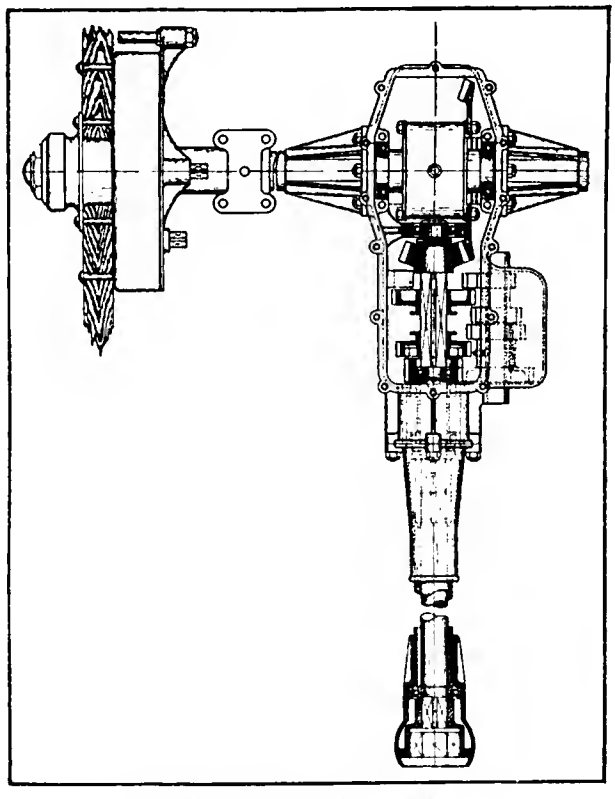
Ignition shows a marked breaking away from the practice exemplified on the four-cylinder motor, which will be retained for 1909. This is a patented low-tension system with a particularly effective make-and-break. The new system, on the other hand, uses an imported high-tension magneto as the source of current for a jump-spark system, a vibrator coil being used for starting. Extra batteries are carried in reserve to provide for any possible failure of the magneto system or any of its parts. This magneto, an Eiseman, is directly driven from the auxiliary shaft on the left hand side. The latter drives in succession, from the front end back, the lubricator which forms part of the crankcase, the centrifugal pump and opposite cylinders four and five, the magneto. This shaft, as is shown in the pump illustration herewith is made with a series of universal joints, which allow of the removal or replacement of any of the units.

Transmission Forms Part of the Rear Axle.

The drive from the engine is through a multiple disc clutch to a three-speed selective transmission located on the rear axle, and from there by floating rear axle to the wheels. This represents a big concession to public opinion and a radical departure from the usual Matheson chain drive. A multiple disc clutch, consisting of fifty-one discs, affords a friction surface of 1,500 square inches. This is practically indestructible, absolutely reliable, runs in oil, and is located in the hub of the flywheel. It is extremely flexible; will slip without heating; requires a light pedal pressure; absorbs all undue shocks, and affords a maximum of comfort to the passengers. The circulation of the water is effected by means of a powerful gear-driven centrifugal pump. Very large pipes are used in the cooling system, and a honeycomb type of radiator. Control is by spark and throttle levers on top of the steering wheel, an auxiliary foot throttle, hand lever for the speeds, and outside hand-brake lever. The important question of lubrication is well taken care of by a force feed lubricator forming part of the crankcase, with a small sight feed on the dash. Every engine bearing, including the valve rocker arms, is positively lubricated.

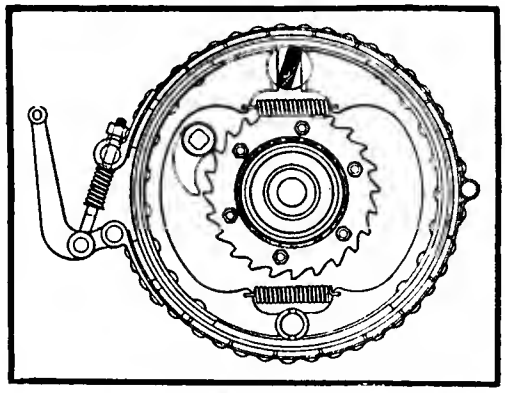
Four compensating brakes are fitted, two contracting bands on the outside of drums attached to the rear wheels, two internal expanding inside the drums. Metal-lined throughout and operated by pull rods, no cables are used. A simple hill pawl operating in the rear drum enables the car to be stopped on up-grade without recourse to the brakes.

A pressed-steel frame of the drop type, of liberal dimensions and reinforced by trusses, taken in combination with the three-



Outline Plan of Rear Axle and Transmission.

quarter scroll elliptic rear springs allows a maximum of comfort. The axles are of nickel steel, the front being an I-section forging; 36-inch wheels run on Timken roller bearings in front and imported annular ball bearings in the rear. These wheels are equipped with 4-inch tires all around, which is an unusually large size for a car of this weight, 2,900 pounds, and at this price, $3,000. A long wheel base of 125 1-2 inches, coupled with the fine springing, will assure easy riding, being an excess of from three to six inches over former cars selling at the same price.



Pawl for Stopping Car on Hill Without Brakes.

The bodies are of sheet steel following closely along foreign lines, are luxuriously upholstered and very comfortable. The equipment is unusually full, consisting of five lamps and gas tank, horn, tools, tire-repair outfit, tire carriers, etc.

CADILLACS WON BRITISH MERIT PRIZE.

LONDON, Jan. 27.—The Dewar Challenge Trophy is annually awarded by the R. A. C. for the most meritorious trial held during the year. After careful consideration of the many trials during 1908, the committee unanimously decided that the trophy be awarded to the Anglo-American Motor Car Co., Ltd. The following are the official particulars:

"Standardization Test of Three Cadillac Cars, February 29, 1908.—Three 10-horsepower cars for this test were selected from stock by the club. The cars, after being run about twenty-seven miles on Brooklands track, were dismantled and subsequently regrouped and reassembled, some parts also being taken from stock to replace some removed by the technical committee. The assembling was done without any "fitting," and the cars started up without trouble, each subsequently running 500 miles at an average speed of 34 miles per hour, with an average fuel consumption of 29.64 miles per gallon. No. 2 car had one minute's stop to replace a split pin in the ignition rod."

ONE MAN'S WORK IN AUTO BUILDING.

It was in the late eighties that R. E. Olds began his experience with the "horseless carriage." It is interesting to note his progress since that time up to the present, and herewith is given the official chronology, and some production statistics for late years, supplied by the Reo Motor Car Company, of Lansing, Mich.

1864, June 3.	—Birth of R. E. Olds at Geneva, Ohio.
1885,	Purchased one-half interest in shop of P. F. Olds & Son.
1886,	Started first experiments with "horseless carriage."
1887,	Constructed and operated his first three-wheeled "horseless carriage."
1890,	Olds Gasoline Engine Works incorporated with capital of $30,000.
1892,	Brought out a practical four-wheeled automobile.
1893,	Sold his first motor car to an India patent medicine company.
1896,	Olds Motor Vehicle Company organized with a capital of $50,000.
1899,	Olds Motor Works incorporated, absorbing Olds Motor Vehicle Company and Olds Gasoline Engine Works, R. E. Olds, president and general manager.
1904, Jan.	R. E. Olds severed connection with Olds Motor Works.
1904, Aug. 17,	Reo Motor Car Company organized, R. E. Olds, president and general manager.
1904, Sept. 5,	Ground broken for first building of Reo plant.
1904, Oct. 15,	First Reo car run out of temporary quarters and started on a 2,000-mile test run, with R. E. Olds at the wheel.
1904, Dec. 1,	First Reo building completed.
1905, Jan. 1,	Wheels of new Reo plant set in motion.
1905, Mar. 21	First carload of Reos shipped from the factory.
1905,	Volume of Reo business first year, $1,374,084.02.
1906,	Volume of Reo business second year, $3,097,579.15.
1907,	Volume of Reo business third year, 4,336,208.14.
1908,	Volume of Reo business fourth year, 4,799,010.71.

SPAIN'S MARKET AFFECTED BY HIGH PRICE OF GASOLINE

CONSUL-GENERAL FRANK D. HILL forwards from Barcelona a letter addressed to him from Madrid, calling attention to the restriction in the motor machine trade through the high price of gasoline:

"Your attention is respectfully called to the following data referring to the gasoline market in Spain and the effect of same on the sale of so-called explosive engines or motors. It is the consensus of opinion of all those who, like the writer, have studied the possibility of creating in Spain a market and demand for engines or motors in which power is developed by the combustion of vaporized petroleum products (gasoline, benzine, naphtha, kerosene, etc.) that a trade amounting to an annual sale of hundreds of motors, ranging in power from 1 to 20 horsepower, and in price, at the seaboard of the United States, from $50 to $1,000 each, could be and would be developed were it possible to employ such motors economically; i.e., were it possible to develop power with such motors or engines at a cost that would allow some profit on same to the immense number of users of small quantities of power whose industries will not warrant the installation or care of expensive steam or electrical power producers. This motor trade is barred from Spain at present by the prohibitive cost of gasoline. The per horsepower cost in the United States of 1 cent is increased to approximately 5 cents in Spain for the same unit.

"The technical result of a reduction in price to one-half would be the replacement by vapor or explosive motors or engines of thousands of horse and hand gears, and the general commercial result would be the ability of the small class industrial all over the country to produce locally the exact amount of horsepower necessary to his specific needs at 15 centimes ($0.026) per horsepower-hour instead of the present minimum cost of 30 centimes ($0.051), with a minimum of capital invested in his power-producing installation. The so-called small class industrial exists by thousands, and the fact that 15 centimes ($0.026) per hour is a profit-giving cost of 1 horsepower, proves beyond the possibility of successful contradiction that the consumption of gasoline, lubricating oils and other petroleum products would be increased many fold in a relatively short space of time.

"The lowest reasonable estimate of the number of motors which would be placed (given a reasonable price on gasoline) must necessarily run into the thousands, while the increase in the number of autovehicles consuming gasoline and mineral lubricating oils would of course be considerable. As the consumption of a 3-horsepower motor, when worked to full capacity, is 3 gallons per 10 hours, or 900 gallons per year of 300 working days, it will readily be seen that the annual consumption of gasoline in Spain would soon be increased millions of gallons, and as only high-class lubricating oils (side products in petroleum refinement) can be used on both motors and autos, the increased consumption of same would be correspondingly great." The future of this situation will be well worth looking into and that the field will pay for exploitation is assured.

EFFICIENCY OF MANLY HYDRAULIC DRIVE SYSTEM*

IN the issue of THE AUTOMOBILE, December 10, 1908, the preliminary report of the Manly drive showed the machinery and afforded such information as was then to be had within the bounds of accuracy. The question of efficiency had been investigated, but the figures were not available. The report of George H. Barrows, of Boston, Mass., is appended (in part), and it is believed that this material will adequately make up for the lack of information, of a certain character, purposely left out of the first description of the equipment. The report of the engineer as follows is herewith essentially given:

The Manly drive is a device for transmitting power by hydraulic means from one revolving shaft to another, with the object, first, to secure any desired speed of the driven shaft, either forward or backward, without changing the speed or direction of motion of the driving shaft, and second, to transmit the power to a shaft which is either in line with the driving shaft or which lies at any angle to the driving shaft and separated therefrom.

It consists of a multi-cylinder pump with variable stroke which is attached to the driving shaft, and one or more multi-cylinder motors having a fixed stroke, which are attached to the driven shaft, together with pipe connections or passages between them for transmitting the working field. The various cylinders, both of the pump and motors, radiate equidistantly from a central crank-chamber, and the pistons or plungers are connected to a single crankpin, which is common to all. The fluid used is ordinary machine oil, the lubricating qualities of which, and its freedom from danger of freezing, admirably fit it for such a purpose. When once filled the oil is used over and over again, being in continuous circulation from pump to motor through one set of pipes or passages and back again from motor to pump through another set.

Technical Description of the Manly Drive.—Fig. 1 shows the location of the multi-cylinders around the central crank chamber, the number in use in the instance illustrated being five. Fig. 4 gives an elementary sectional elevation showing the cylinders and valves of both pump and motor, and the pipes forming the connection between them. A represents the plungers and B the valves of the pump. Connection between the two is made by passages leading from the head ends of the pump cylinders to the centers of the corresponding valve chambers. C represents the valves and D the plungers of the motor. Here the passages between the valve chambers and the plunger cylinders lead from the center of the valve chambers to the head ends of the motor cylinders. The corresponding ends of the two valve chambers are connected by the pipes E and F. One pipe carries the oil in one direction and the other pipe returns it in the opposite direction. The outer ends of the five valve chambers of the pump are connected by the circular passage G and the inner ends by the circular passage H. Likewise the five valve chambers of the motor are connected by the circular passages I and J. In this elementary diagram the two shafts (both driving shaft K and driven shaft L) are shown in the same line, although disconnected. It will be readily seen that the two shafts may occupy any angular position with reference to each other, and any distance apart, the connecting pipes being arranged

* Continuation of the article in relation to the Manly drive, from the issue of December 10, 1908.

The Length of the Stroke is Adjustable.—The stroke of the pump may be varied at will; that of the motor is fixed. The variation of the pump stroke is accomplished by a crank on which is mounted an eccentric bushing. By revolving the bushing with reference to the crank its center line is brought into alignment with the center of the shaft, and when this position is reached no reciprocating motion is communicated to the pump plungers.

The High Speed is Coincident with Full Stroke.—When the pump

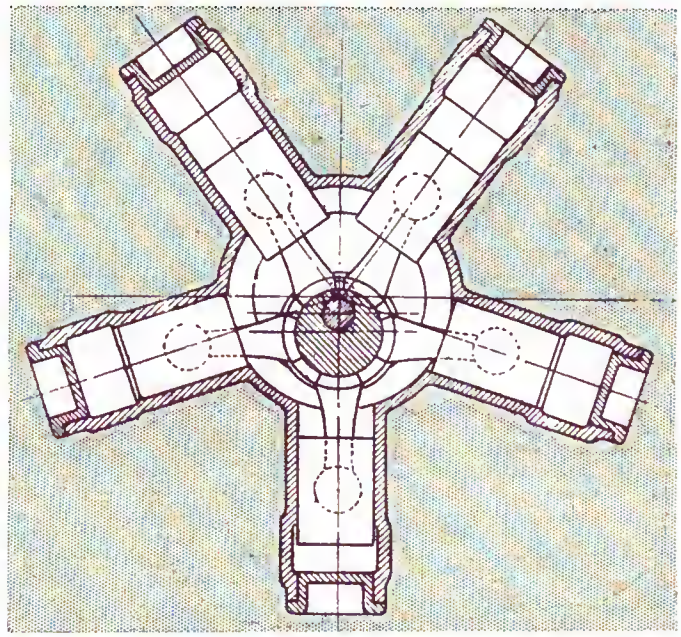


Fig. 1—Disposition of Multi-Cylinders Around Crank Chamber.

is running at full stroke the motor operates at the highest speed. By varying the pump stroke and thereby the velocity of the oil in circulation, the motor runs at a speed which is just in proportion to the amount of oil that passes through it. Any desired rotative speed can therefore be secured and maintained. For reversal the pump stroke first passes through the zero point. Then the valves change, and the oil is simply pumped in the opposite direction through the ports and pipes. Referring to Fig. 4, when the motor is going forward, Pipe E furnishes a supply to the motor transmitting the oil under pressure from pump to motor, while Pipe F returns it from motor to pump, thereby answering the purpose of an exhaust pipe. When the motor goes backward Pipe F becomes the supply pipe under pressure, and Pipe E changes to the exhaust pipe; the direction of circulation through the connecting pipes being completely reversed. In case of a sudden check in the speed or a quick reversal, the momentum due to

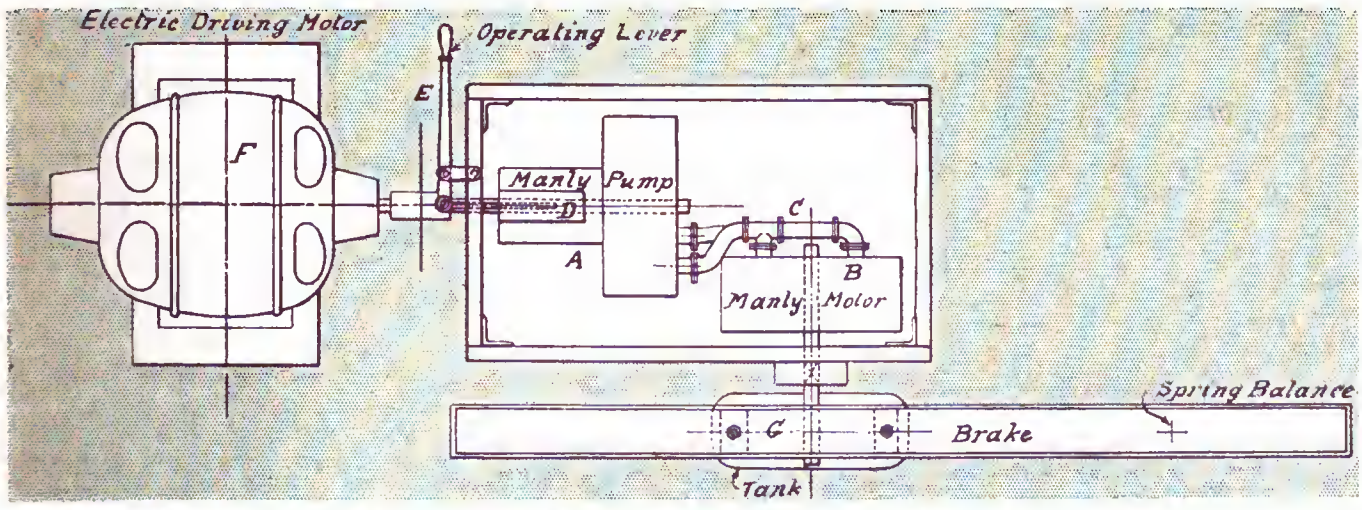

Fig. 2—Diagram of Testing Equipment Involving Motor, Manly Drive, and Prony Brake Suitably Balanced and Calibrated.

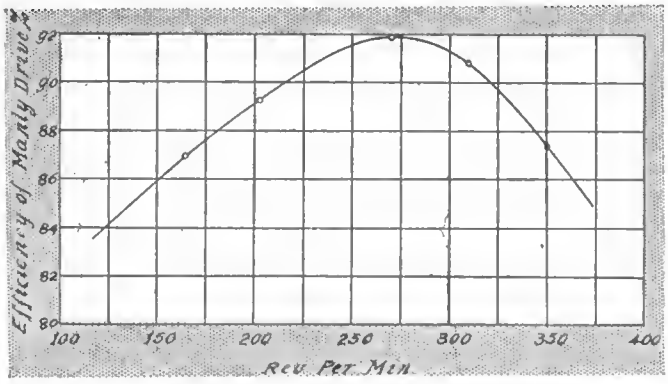

Fig. 3—Curve of Efficiency of Manly Drive as Found by Test.

running in one direction is taken up in the device itself. A safety valve, set at 2,000 pounds per square inch, opens a by-pass when there is an over-pressure, and this acts as a cushion, preventing injury to the machine.

How the Length of the Stroke is Adjusted.—Considering Fig. 3, the crank by which the length of the pump stroke is adjusted: A is the center of the shaft, B is the center of the bushing, while C is the center of the crank. Point C lies half way between points A and B when all three are in line. With this arrangement it is readily seen that when the bushing is rotated at 180 degrees around the center C of the crank, the center of the bushing, which is the real crankpin, is brought into exact alignment with the center of the shaft, and when this occurs, the length of the crank becomes zero and the reciprocations cease, as explained above.

Speed is Changed by the Rotation of Crank Bushings.—The rotation of the crank bushing from the position of maximum stroke to the no-stroke point is accomplished by the use of an auxiliary piston, lying parallel to the shaft, and supplied with power from the fluid pressure of the pump, and this piston operates on the bushing through appropriate mechanism. It is under the control of a pilot-valve, which is moved at will by means of a hand-lever. By simply moving this lever from one end of its throw to a central position, the speed of the motor shaft is varied from its maximum speed to a condition of absolute rest, and by moving the lever to the other end of its throw the motion is reversed and any speed is secured ranging from zero to a maximum speed in the reverse direction. Meanwhile, the driving shaft continues to run at constant speed, whatever the speeds or direction of motion of the driven shaft.

In Neutral the Drive Serves as a Brake.—When the motor comes to absolute rest, the pump stroke being reduced to zero, no motion of the motor is permissible in either direction until the adjustment is changed so that the fluid again begins to flow from pump to motor. Its effect at such times is that of a brake applied to the wheels, though much more positive and reliable. The importance of the brake feature can hardly be overestimated when it is remembered that all the effects as to varying speed, reversal of motion and brake action are brought about by the movement of a single hand-lever. When the lever is in its forward position the machine goes forward at maximum speed. When the lever is pulled over to the middle position the machine comes to rest and is locked there as with a brake. When the lever is pulled over still farther to its extreme backward position, the machine goes backward at maximum speed.

Torque Increases as the Speed Decreases.—Still another feature of the Manly drive should be mentioned which peculiarly adapts it to road vehicles traveling in a hilly country, and that is the increase of torque in the driven shaft as the speed is reduced. The torque increases in exact proportion as the speed decreases. In other words, by slowing down the driven shaft the torque or pulling power may be increased to any degree within the limiting blow-off pressure of the safety-valve. Whatever the capacity of the engine, the vehicle may be propelled up any hill, however steep the grade, provided the speed is slow enough, and the wheels do not slip.

By referring back to the earlier article in THE AUTOMOBILE the aims and possibilities of the drive will be rendered at once apparent, and by examining the curve for efficiency (Fig. 3), as given in this article, it will be seen that the plan not only represents flexibility, but that the power is quite thoroughly used up in actual tractive work. Fig. 4 is a diagram of the equipment for test purposes.

As will be observed the efficiency is not only very high, but it is what is designated as a "flat-top" curve. True, the efficiency is not absolutely constant for all speeds, but it is very nearly so. The lowest efficiency is at the lowest speed (84 per cent.), and the highest efficiency is at the mid speed (92 per cent.), while the speeds range from about 120 to 375 revolutions per minute. Considering the very low speed, on the one hand, and the wide range of speeds on the other, the performance is extremely good, especially in commercial work involving slow speeds.

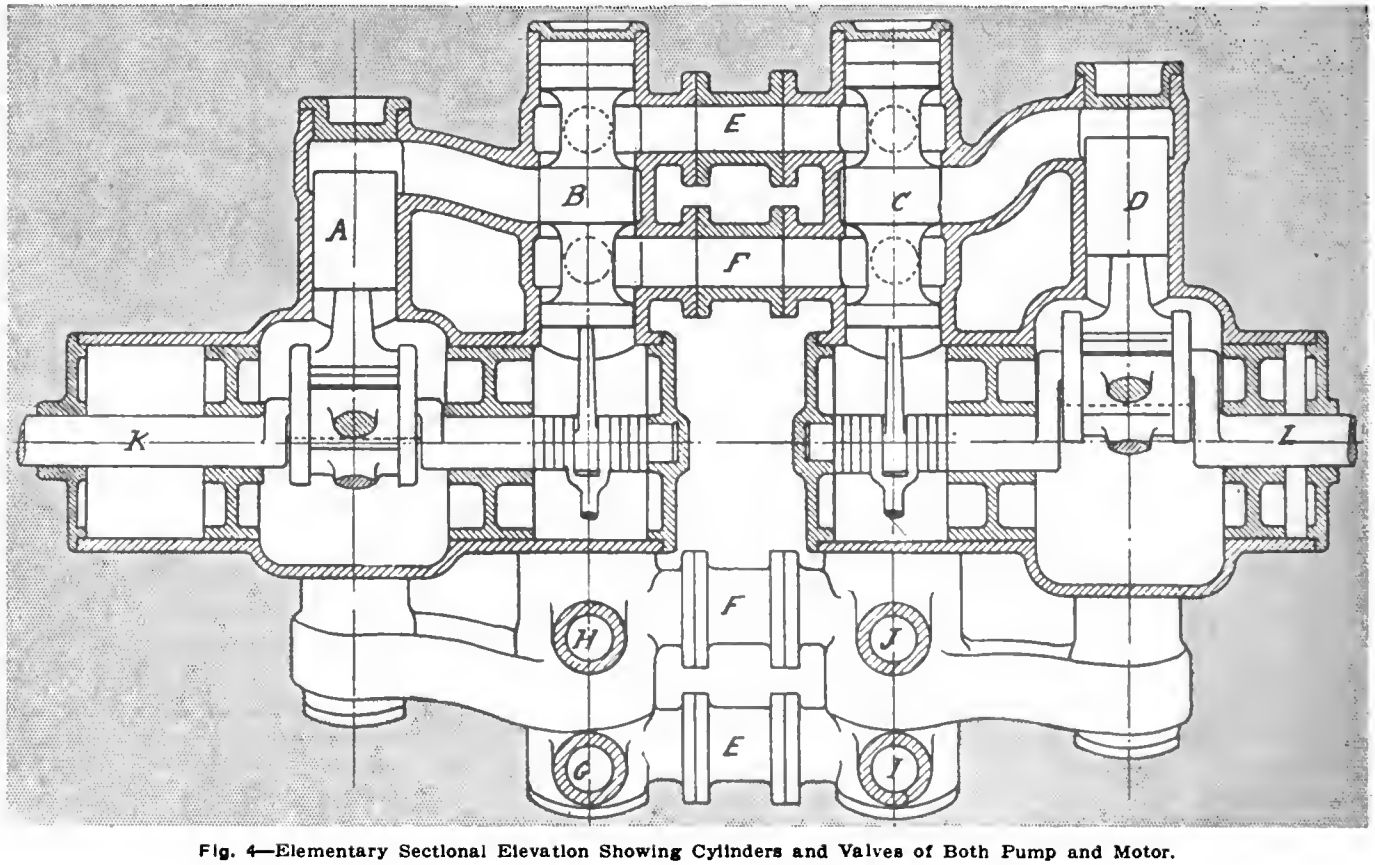

Fig. 4—Elementary Sectional Elevation Showing Cylinders and Valves of Both Pump and Motor.

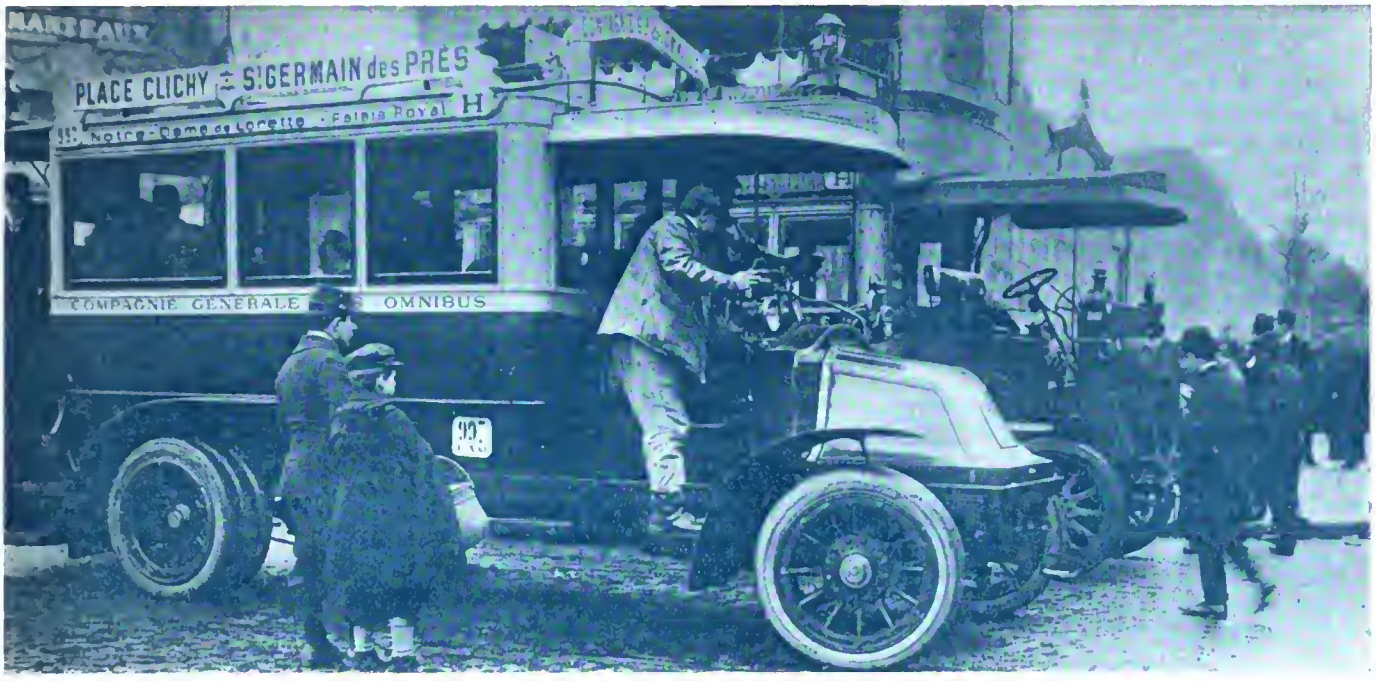


New Renault Omnibus Now in Service in Paris, with Double and Triple Tires—Old Type 'Bus Alongside.

A FRENCH OMNIBUS WHICH USES PNEUMATIC TIRES

PARIS, Jan. 27.—An omnibus mounted on pneumatic tires is the luxury that the General Omnibus Company of the French capital is offering to its clients. In a little over a year's time the monopoly of the present company will expire, and if it is renewed it will be only on condition that all horse buses are abolished and a satisfactory type of mechanical vehicle substituted throughout the city. With a view to showing what it was capable of doing the company commenced the gradual conversion of its vehicles about three years ago, certain lines being changed from horse to gasoline traction. But a perfect type of bus was not easy to find, and, although the company has now nearly two hundred buses, they are not all of the A1 mark. Automobile traffic moves fast in Paris, the buses being no exception. The consequence is that the mechanism, mounted on solid rubber tired wheels, goes to pieces long before it ought to, the passengers suffer from excessive vibration and the inhabitants of houses along the routes complain of the noise and shaking of their dwellings.

After numerous tests the company has now decided to adopt a new type of bus, and it is as the result of this decision that the public is now initiated to the luxury of pneumatic tires. The first of the new vehicles, a Renault of 20-30 horse-power, has just gone into service from Place Clichy to St. Germain des Pres, Paris, one of the most difficult routes in the city, for it comprises crowded streets, some steep grades and rough pave, all enemies of the motorbus. The new Renault, the first of a series of 75 similar vehicles, is mounted on Michelin triple and twin tires, the former being for the rear wheels and the latter for the steerers. This new type of rim and tire, which has been under test for the past two years, only made its appearance in public at the recent Paris Salon, and is now being given its first real commercial test, the Renault being the first ordinary public service bus in the world to be mounted on pneumatic tires.

All previous buses have been two-deckers, with canopy top for the protection of outside passengers. The Renault is a single-decker, having capacity for 21 passengers, nine of them having first-class seats in the forward part of the bus, six second-class seats and six standing on the rear platform. The body is swung lower than on any previous type of bus, is wider, has a much more commodious platform and is entered with greater ease. Artificial lighting is by powerful acetylene lamps, big side windows, in place of smaller ones on the older buses, let in ample daylight, and heating is by means of a pan running the full length of the bus and receiving the hot gases from the exhaust. Normally the exhaust is discharged vertically at the top of the vehicle, but when required for heating can be turned into the foot pan, thus going for utility.

A touring car chassis would naturally be impossible for a vehicle destined to take a charge of three tons; but though the Renault bus is a special construction, it embodies all the distinctive Renault features. Thus the frame is of very deep section pressed steel, strongly bound by cross members and angle plates and suspended on semi-elliptic springs both front and rear. The front wheels are wood artillery type, with special double dismountable rims; the rear wheels are of the steel plate type, each with dismountable rims for three tires. There is a considerable rear overhang of the frame to give the necessary body space, the body itself, however, being kept within the axles.

The engine, unlike other Paris buses, is not under the driver's seat, but carried forward under a Renault type of bonnet, with radiator on the dash, the water circulation through it being by thermo-syphon. The driver's seat is placed on the left-hand side, with brake and change speed levers in the center of the space, this position, it is believed, being to the advantage of the driver for crowded city work. Another innovation for a city bus is the use of a self-starter of the compressed air type, worked off the timing gears, as on Renault touring cars. The control of the starter is at the left-hand side of the dashboard, and is provided with a special lead for taking off compressed air.

Even for such heavy work all Renault touring car characteristics are adhered to for transmission and final drive, the clutch being of the leather-faced, inverted cone type, the gear set of the progressive type, with three speeds forward and reverse, and the final drive by propeller shaft and rear live axle. Naturally, all the parts are adequately strengthened for the work they have to perform, and gear ratio is very much lower than on touring models.

It remains to be seen whether a bus of this type—perfect from the standpoint of the passenger, for it possesses speed, quietness and an entire absence of vibration—will be satisfactory to the

operating company. It is declared that the ten pneumatic tires cost no more to maintain than the solid rubber and rubber block tires formerly employed. This, however, remains to be proved in practice. It is certain that there will be a considerable lengthening of the life of the mechanism as the result of the use of pneumatics, and this item will have to be taken into account when considering the smaller earnings of the bus due to the abolition of the upper deck. It has commonly been supposed that pneumatic tires were impossible for public service vehicles on account of their cost, but there was also another factor, namely, their inability to carry the loads put on commercial vehicles. If, as is claimed, the tire cost is not excessive, the introduction of twin and triple tires will cause a revolution in the motorbus world, for the public will not consent to ride on solids where pneumatics are available.

TRUCKS FOR TEA COMPANY.

NEW YORK CITY, Jan. 25.—A move indicative of the tendency of the times is the substitution of motor delivery wagons for the former horse service. This move on the part of any large company as a result of thorough investigation of the problem will doubtless be watched very closely by hundreds of allied concerns who are seriously considering a similar change.

The latest announcement in this line is that the Great Atlantic & Pacific Tea Company, of Jersey City, N. J., which operate 323 branch stores, and employ 1,500 horses in the handling and distribution of their supplies, have, after a series of extensive and varied tests, covering a period of over two years, decided to adopt the gasoline motor vehicle for delivery service.

This company's conversion has been demonstrated by placing its first order with the Autocar Company, of Ardmore, Pa., for a number of trucks to be used at five of their prominent branches, notably Baltimore, Newark, Washington, Passaic and Jersey City.

BUT THE "CABBIES" WILL DISAPPEAR.

DETROIT, Feb. 1.—A truce has been patched up between the warring factions in the cab-taximeter fight, and peace once more reigns, for the time being at least. When taxicabs first appeared in Detroit and stationed themselves in front of the hotels, a howl went up from the local jehus guiding the archaic vehicles compelled by the common council to content themselves with stands about the city hall. The "cabbies" wanted the "taxies" placed under the same restrictions regarding rates of fare as governed them, and insisted on the taxicabs being kept away from the hotels.

Finally a compromise was effected. The question of fares was waived by the "cabbies," and in return Manager Scrimger, of the taxicab company, expressed a willingness to share the space in front of the hotels with the horse-drawn vehicles, providing the latter could secure written permission from the owners of the hostelries. As a result the "cabbies" are congratulating themselves on their victory, although the desired permission has not yet been granted.

IF WAR, FRANCE WILL TAKE ALL AUTOS.

PARIS, Jan. 27.—All automobiles in France, whether used for pleasure or business purposes, are to be controlled and registered in such a way that they will be ready for incorporation into the service of the army in time of war. Every year, from January 1 to 15, according to a project which has just received the sanction of Parliament, a census of automobiles must be taken.

Price to be paid the owner of an automobile being requisitioned for active service, will be clearly settled in advance, the vehicles being placed into three categories, comprizing those less than two years old, those having been in existence two, three or four years and those having been constructed five or more years before the date when the census is taken.

ONE ST. LOUIS COMPANY EMPLOYS 53 ELECTRIC TRUCKS

ST. LOUIS, Feb. 1.—One of the large brewing companies of this city operates 53 electric trucks and delivery wagons, more than half of which are Waverleys. Of the 53 electrics, 48 are in daily service and are standing up to their duties in a truly remarkable manner, as the following record for month's service, taken at random, will show:

28 did not lose a minute's service for any reason whatever.

16 missed one day apiece during the month on account of the drivers not being on duty.

4 lost from half a day to a full day on account of general repairs.

In other words, the number of automobiles out of commission for the month on account of repairs was less than one-fourth of 1 per cent. of the total in operation—and this is the record of a company that keeps its wagons constantly active.

To keep all these electrics in operation requires only one machinist, one battery man, a boy, a foreman and two wagon washers. This small amount of labor for so much equipment goes to show that electrics are easily maintained in first-class condition under favorable conditions of cost.

The Waverley Company, of Indianapolis, is the pioneer builder of electric vehicles for commercial purposes in this country and has spent thousands of dollars in costly experiments to develop its trucks to their present high state of efficiency. The value of this experience is now becoming manifest in the growing use and appreciation of electric commercial vehicles in all the large cities in very important work.

Waverley Electric Trucks in Daily Service for One of the Large St. Louis Breweries.

ELECTRICS CHASSIS AND BODY NOW BUILT SEPARATE

"IN ye olden times" electric vehicles were so designed as to include chassis and body as inseparable. It was not then possible to select a chassis on which all the equipment would be found, and thereafter use any kind of a body that fancy might dictate. In connection with gasoline automobiles the reverse was true almost from the start, and it was soon rendered apparent that advantage was with the designs in which the chassis was complete and the body work figured as a separate unit, taking into account the convenience of the autoist.

It will come as no surprise to those who have kept tabs on the doings of the advanced designers of electric vehicles in the statement of the fact that "Baker" makes the chassis of the electric separate, and that any kind of a body can be selected. The illustration of one of the Baker chassis as here given will at once disclose the fact that all the machinery, including the battery and the control, is quite independent of the body work, and any desired design can be selected, or, in the course of events, it is desired, to make a change it is easy.

There are manifest advantages in a plan of this sort, aside from the fact that the body can be as wanted or changed at will. It is generally well understood that body work as it obtained in the past did not thrive because the battery gave off acid fumes, and the action of the fumes was such as to depreciate the body at a too rapid rate. In the new Baker way of building electrics the body is so separated as not to be under the influence of the battery, and the electrical equipment is so distinct as not to influence the situation for ill. On the other hand, the separate chassis idea is good in that should the body give out in time only a question of a new body would have to be considered, instead of being confronted with not only a new body but much more besides. Under the old plan, even if the chassis could be rescued, the fact remains that the battery box, wiring, and oft-times much else, would have to be replaced, and the upshot was that the task became far too formidable, with the result that the cars so designed went to the second-hand dealer.

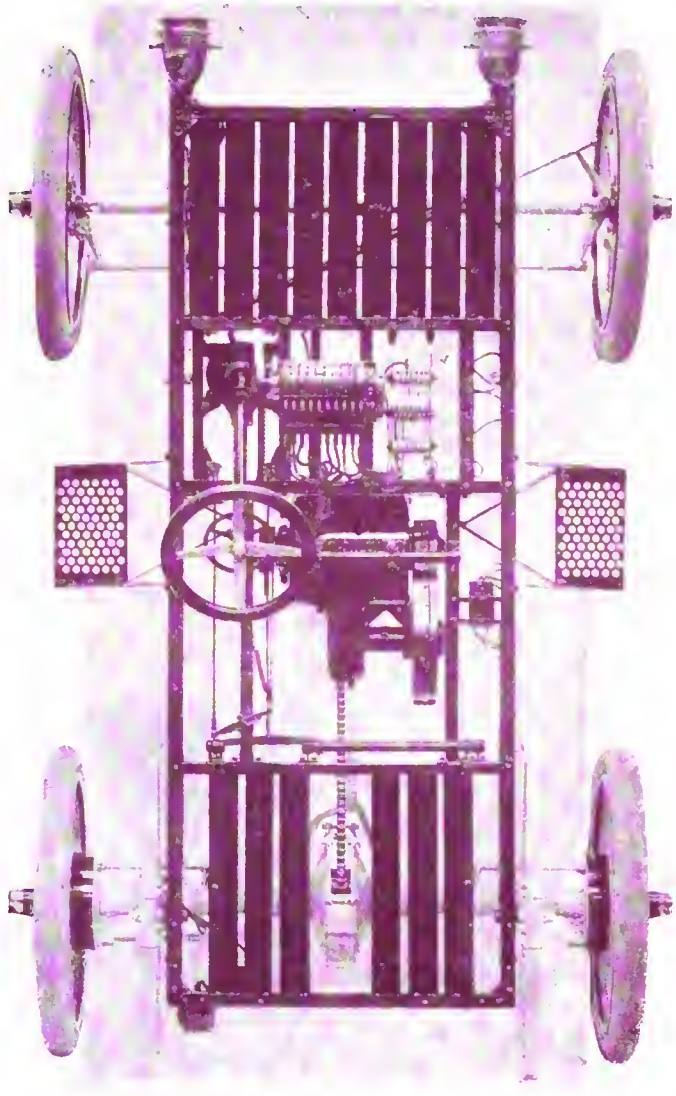
In the illustration it is to be noted that the motor (electric) is located in the mid position, between the front and rear axles, and the "drum" type controller comes forward of the motor, under the footboards of the deck. The motor is of the "double reduction gear" type, and brakes are provided on a drum on the second shaft. The sprocket pinion is also on the second shaft, and one chain connects with the differential sprocket on the live rear axle. The live rear axle is of the latest and most approved type, provided with emergency brakes, and in every way it is up to a most fitting standard.

The front axle is a standard automobile proposition in every particular, and the one big difference lies in the fact that the steering wheel is on the left side. This scheme of steering is looked upon as of the greatest benefit in "town service," and it is in this same town service that electrics have proven to be of the greatest utility. The chassis frame is of the channel section quite up to the standard set for gasoline cars, and the spring suspension is elliptic in the rear, with half-elliptic front springs.

The electric wiring, which was the bane of all the earlier electric efforts, is so nicely done in the new Baker cars as to demand special mention. All who may have had occasion to follow the progress of the electrics in the past were in accord in one or two particulars, and it is very likely that the wiring question, with its high depreciation, was one of the points on which they agreed. They will all be glad to know that in the Baker chassis this question is not to be one for future trouble. The wiring is so arranged as not to be in the category of trouble. In the event of trouble on the road, which is remote in a car of good design, it will be easy to handle in view of the accessibility of the wiring, controller, and the motive power.

The steering wheel is of standard characteristics, and the drum controller is manipulated through the good offices of a "miter gear," one member of which is on the drum and the other member is on a tube related to the steering post in such a way as to enable the driver to manipulate the drum with ease and according to the requirements. All the details for the perfect control of the car are worked out in the light of much experience, and they show the earmarks of a shop adequately equipped.

The battery space is large, and the ease with which the battery can be examined is something to be taken into account. In the older types of cars in which the battery, more often than not, was so placed as to be inaccessible, trouble was frequently of the sort that ended in a feeling of great dissatisfaction, on the count that if the "spot" could be reached the trouble would melt as snow in the full blaze of a tropical sun. In other words it was not the magnitude of the trouble so much as it was the fact that the "itch" could not be reached.



Baker Chassis Complete Allows of Body Choices.

There is one other point in relation to the cars of the subject. It is well understood that the energy of the battery should be conserved, and if the chassis is not carefully designed along lines to cement harmony the energy of the battery is bound to be dissipated to a vast extent, and the mileage of the car will then be reduced. In the Baker cars this question of the mileage is well looked after and the losses are reduced to the minimum through the use of anti-friction bearings.

A HOME GARAGE EQUIPPED FOR ELECTRICS

THE garage illustrated is that of Mrs. John T. Brush, of Indianapolis, Ind., and in view of the wide interest in the practicability of the scheme it will come as a pleasurable bit of information, with assurance that, in this case, the home garage is an unqualified success. In view of the interest taken in this phase of the automobile situation, it will be well to outline the plan, enumerate the equipment, and state some of the advantages, and to say that the Pope-Waverly electric used in this case is what is known as the model 70-C. As a general rule it is true that space is cramped in well-populated districts, and a stable is not without serious drawbacks.

The garage is quite ample for the purpose in this case, but the point is made that there is room in the same which is not monopolized, in that the car and the charging equipment take up but a fair amount of space. The charging equipment is shown to one side of the car, and it consists of a panel on which are mounted in a neat and substantial manner the devices used for the purpose. The outfit consists of (a) the "service" switch, by means of which the electric service is admitted to the "bus-bars"; (b) the charging switch, through which the current is admitted to the battery; (c) a lighting switch, by means of which the lights are turned on in the garage; (d) a voltmeter, by means of which the voltage of the charging current is measured; (e) an ampere meter, by means of which the charging current is measured; (f) a rheostat, the function of which is to regulate the strength of the charging current; (g) suitable safety devices, affording protection as against excesses of the electrical supply; (h) the panel of marble, on which the devices are mounted (sometimes slate is used), the panel itself acting as an insulator; (i) the framing, of iron, which serves to maintain the panel in position.

The panel stands out from the wall enough to enable the workman to mount the devices from the back, and the wiring and connections are all out of sight, yet accessible.

When a direct current of electricity is available, it is the rheostat that is used for the purpose of regulating the strength of the current. If, on the other hand, alternating current has to be dealt with, it is then that a "rectifier" is provided for the purpose. At all events, the scheme is perfectly simple, and the charging plug is so devised that it cannot be inserted wrong, and in divers ways protection is afforded so that any one can do the work.

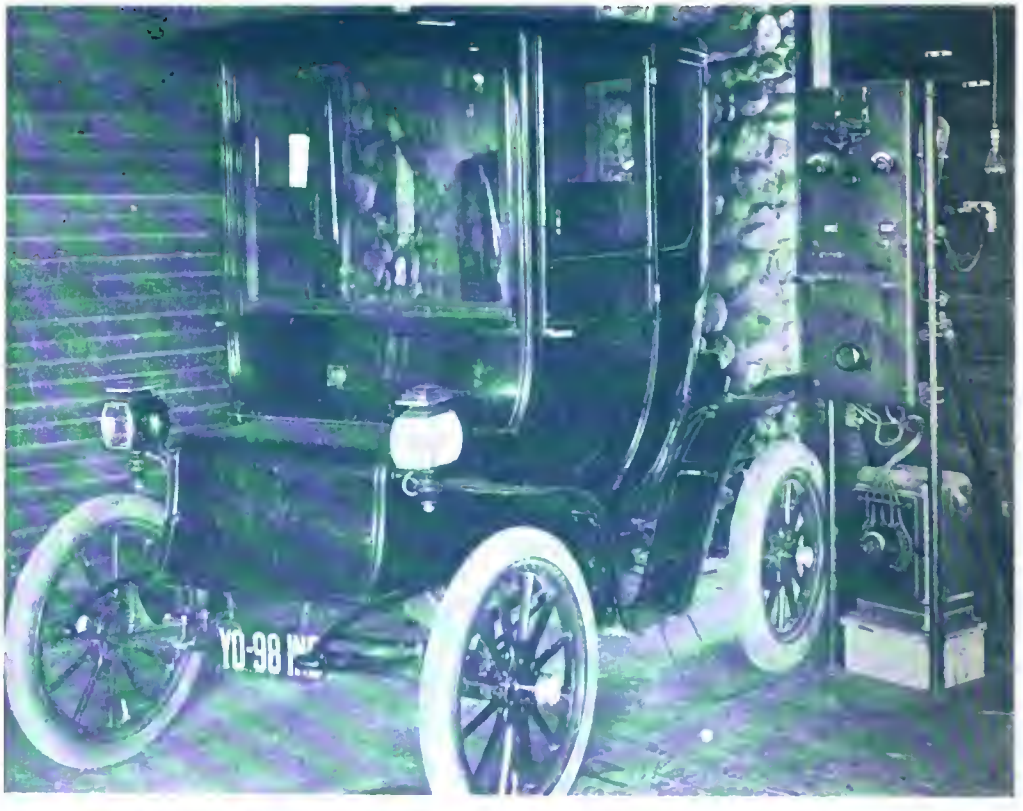
In Pope-Waverly electric vehicles the battery is so arranged and of such a capacity that it is rarely drawn upon for a full charge, and when it is to be charged it is "floated" on the circuit, so that the "man" does not have to attend to it, to any great extent, if at all. On rare occasions it is desirable to give the battery a full "corrective" charge, which is only a matter of starting the charge at a somewhat higher rate, and allowing the same to "taper" down to the minimum, then, by increasing the charging rate again and allowing it to taper off as before, the battery becomes refreshed to a marked degree, and the amount of work attending is but slight.

Any one can do the "charging," as it is called, after being shown once, and while it is true that the time will arrive when the "batteryman" will have to come around and take the "gravity" of the electrolyte and equalize the same, it is far from the amount of work which has to be expended upon even a single horse. The vehicle is always ready for service, and it can be taken off the "float" at a moment's notice. As a matter of fact, the more the vehicle is used the better will the battery work, since it is true of batteries that the "pores" are kept open if the battery is charged and discharged frequently. True, the life of the battery must, in the long run, be taken into account, but it is remarkable how long a battery will last, especially if it is kept in constant use, receiving its charge daily, as the car comes home.

There is no denying the fact that constant use is better than intermittent service, and it is one of the advantages of the electric vehicle that it thrives in service. The Pope-Waverly is intended for that class of users who really need a car, and who utilize it frequently. Every attempt is made to reduce the maintenance to an automatic basis, and in the control of the car simplicity is so conspicuous that the cars may well be entrusted even to a girl of few years and small experience.

The car rolls on anti-friction bearings, the weight is moderate, and the distribution of the weight is on a scientific basis. As a result, the performance is smooth, the battery is conserved, and noiseless elegance is written all over the product. After the car (in a given case) has performed its day's work, it is run into the garage, washed, and the charging plug is inserted, the resistance is adjusted, and the rest is done without the personal attention of the owner or the man whose duty it may be to look to the wants of the car.

On the whole, it is plain that an electric will do far more work than can be done with horses, and the attention which must be lavished on horses would be wasted on the electric, moreover the electric is an equipment of surpassing elegance, ever ready.



Charging Plant in the Garage of Mrs. John T. Brush, of Indianapolis, Ind.

LETTERS INTERESTING AND INSTRUCTIVE

COMPARISONS ARE EXTREMELY ODIOUS.

Editor THE AUTOMOBILE:

[1,729.]—Will you kindly inform me in your "Letters Interesting and Instructive" whether there is any inherent defects in air-cooled motors for automobiles? I am contemplating the purchase of a four-cylinder air-cooled car, recently placed on the market by a Western manufacturer, but am advised with great unanimity from all quarters not to buy an air-cooled car unless I can afford to get a well-known make which has been on the market for a number of years.

Does your experience and information warrant the assumption that the general aversion to air-cooled cars is simply a matter of prejudice, or is it founded from the experience of users of this kind of motor.

Also, if the air-cooled motor is reliable, why are they not in more general use, considering their many advantages?

New York City. H. L. D.

Your question is one which cannot be fairly treated in a "trade journal," if the answer is to be of a specific character, for good and sufficient reasons. In the first place, it is not possible for the editor to become adequately familiar with the details of construction of any given motor to be able to take the stand and say the motor is not good. Then, it is not the business of a paper to predict. The paper is doing its duty to the trade and to its readers as well when the facts (of interest) are clearly set forth and if the trend is reflected.

It is not plain that there is a general aversion to air-cooled motors. The extent to which air-cooled motors are used in automobiles is quite too broad to enable one to say there is any evidence of aversion. On the other hand, there is evidence of the fact that the motors are quite satisfactory to the class of users who have the good sense to select the kind of motor that accords with the specific requirements. In your case it is a question of determining the specific needs and then you should find a motor which will do the specific work.

Your last question is extremely difficult to cope with and it may be true that the reason why air-cooled motors are not more generally used is the same reason why "grand opera" does not become as common as its merit would seem to indicate.

DISCREPANCY IN HORSEPOWER RATINGS.

Editor THE AUTOMOBILE:

[1,730.]—Below please find a list of a few automobiles showing the corresponding bore and stroke with claimed horsepower:

	Bore.	Stroke.	Horsepower.
Locomobile	4½	4½	38
Great Western	4	5	30
Overland	4	4	30
Mitchell	4½	4½	28-30
Cadillac	4	4½	30
E-M-F	4	4½	30
Franklin	4	4½	18

You will note especially that the Franklin, which has the same size cylinders as the E-M-F and Cadillac, does not claim near as much horsepower. I have talked with several of the large dealers, but with one exception I have not been able to get any of them to figure out how their car comes to have so much more horsepower than some of their competitors. One dealer was frank enough to admit that very few cars were up to the claims made for them by the manufacturers. If there is a way to figure this out, kindly give it in your answer to the above. A SUBSCRIBER.

Merriam Park, Minn.

Some of the companies see it in one way and more in another. In some cases it is desired to keep in reserve enough power to render the performance of the cars somewhat better than the promises. In other cases the makers put their best foot forward. There may be cases in which the best foot is artificial. In such cases it is not of necessity in the motors claiming the most power for a given displacement. The 4 1-2 bore will no doubt do the work claimed for it. In fact, it is quite possible for the several cars to perform in the manner as claimed by the makers. What a motor will do is certainly a matter depending upon the manner in which it is designed.

WANTS TO KNOW IF IDEA CAN BE PATENTED.

Editor THE AUTOMOBILE:

[1,731.]—I would like to know if an idea which I have can be patented, and what should be done to secure the same. This is it: To close both ends of piston, as is done in steam engines; this would give two cylinders about the strength of three; and setting the crankshaft at 45 degrees, which would enable the chauffeur to start the machine from the seat. More sparkplugs would be necessary, but this is of little weight by way of increasing the price of the machine, even taking into account the fact that more valves would also have to be furnished. T. LANDOZ.

Humacaco, P. R.

You can apply for a patent yourself if you have the skill necessary to enable you to make the necessary drawings, and render a description so clear as to enable any one skilled in the art to build the device. If you have not the skill, it will be necessary for you to engage an attorney with a license to practice before the patent office.

From your statements it would seem that you have in mind the fact that the cylinders can be made "double acting" and by so doing increase the number of power strokes in the motor. It may be as you say—it is not patentable, on the ground that it is now common practice in gas engine work, considering engines of the larger sizes. It has not been shown in practice that anything is to be gained in the application of the principle to automobile motors.

WHAT WILL A FAN DO FOR A HOT MOTOR?

Editor THE AUTOMOBILE:

[1,732.]—I have a light runabout that weighs about 1,300 pounds, which is equipped with an air-cooled motor. At times the motor runs very hot. Will a fan, suitably placed in front of each cylinder, abort the difficulty? P. O. PETERSON.

If the motor runs cool most of the time, or, even a part of the time, it would seem as if you do not look in the right place for the trouble. True, the fans, as you suggest, will help out, but it is probable that the motor runs hot because you do not afford it the uniform set of conditions, such as will afford you a uniform result.

In the first place, a motor will run hot if the spark is retarded and so held. Then, it is important to use an adequate supply of a suitable grade of lubricating oil. On the other hand, if the mixture delivered by the carbureter is rich the motor will heat up. On the whole it would seem as if you will have more to gain by regulating the spark, adjusting the mixture and supplying an adequate quantity of lubrication oil than proceeding in the manner you suggested.

KEROSENE CREEPS IN BEHIND THE CRUST.

Editor THE AUTOMOBILE:

[1,733.]—Kindly let me know what effect kerosene has on carbon; also, what is generally thought of the carbon cleaners now on the market? what effect acetone has on carbon as a cleaner, also kerosene, alcohol and turpentine? I understand that any or all of them used singly will clean carbon from cylinders, etc. Which is the better scheme, of using kerosene or any of the above, injecting it in petcock on top of the cylinders, or putting a petcock in the intake pipe between the carbureter and the cylinders and inject it in there? With the engine running, it will then be sucked into the four-cylinders in the form of a spray or vapor, the same as the gasoline is supposed to be sucked through pipe. Do you think that this is better than the first mentioned, as in that case the liquid kerosene lies on the pistons and is much more liable to leak through rings and dilute the cylinder oil already in the crankcase. Kindly explain how the G.L. economizer works applied to a carbureter. How is this possible to save the consumption of gasoline?

Brooklyn, N. Y. W. R. N.

The crust in cylinders is not carbon. There is carbon in it. Kerosene has the property of creeping in behind the crust and killing the bond. The result is the crust will fall off of the walls and in small increments it will be swept out of the cylinders. The reports of the performance of carbon removers are so good

that we are persuaded into the belief that they are well worth a fair trial by any one who has trouble with cylinders.

If kerosene is to be used, it should be injected into the cylinders after the motor is shut down, and it should be left there over night or longer if possible. Then it will be necessary to remove the excess of kerosene with such sediment as will come out with it.

Alcohol does not seem to promise much as a remover of crust. Acetone has some value as a solvent. Turpentine is not as good as kerosene. In any case, no matter which of the solvers are used, if they get into the lubricating oil, it is necessary to remove the same, and replace it with new, pure, lubricating oil.

The "economizer" to which you relate is valuable in that it renders the mixture more nearly a permanent gas, and it is the aim to hold to a constant desirable mixture under all changes in speed of the motor.

DEPENDS UPON THE REAL QUALITY OF STEEL.

Editor THE AUTOMOBILE:

[1,734.]—Please answer the following questions: 1. Isn't chrome nickel steel of 125,000 pounds tensile strength suitable for axles and spindles for automobiles? 2. If so, is it better to have rear axles case hardened, and also spindles? 3. Spindles about 13-16 inch, and rear axle 1 inch diameter—are these heavy enough for a car of about 1,100 pounds? 4. I want a two-cylinder, 12-horsepower double opposed engine. How can I make the correct decision on these engines? SUBSCRIBER.

Galva, Ill.

The fact that the steel is chrome nickel and that the tensile strength is as you say, means very little. If the elongation is, say, 20 per cent in 2 inches, with the tensile strength as given, it will indicate a possible fine grade of steel.

If it is desired to have the spindles case hardened it will be desirable to use steel low in carbon; the carbon should not be above 16 points.

If case hardening is to be resorted to, it may be possible to consider the use of mild steel instead of chrome nickel steel. At all events, care should be exercised to procure a good grade of the same if it is used for the purpose.

If a live rear axle is used, the shaft should be 1 1-4 inch in in diameter for the load you state. The fact that the steel is alloyed will not help you out by way of reducing the diameter of the shaft, on the ground that the torsion will not be reduced, and the modulus of elasticity of the chrome nickel steel may not be higher than the modulus for good grades of acid open hearth steel. If the modulus is the same, the amount of material should be the same.

To be able to keep from getting in wrong on the engine, it will be necessary to consider two or three good business principles. In the first place, you must pay enough to cover a good engine; then it is necessary to go to the makers of the kind you want, and you must be able to recognize one when you see it. At all events, do not evince a desire to part with your money; be curious about the engine until you are stalled with information in relation to the same, and fail to buy from the vendor who has not the time to tell you of the qualities of his product.

HOW TO TIME A FOUR-CYLINDER MOTOR.

Editor THE AUTOMOBILE:

[1,735.]—Will you tell how to time a four-cylinder motor with intake valves on one side and exhaust valves on the other? also how to put the timer back in its proper position? H. BUSH.

Schenevus, N. Y.

Put the timer back so that the range of spark advance will be about four-fifths of the total range. In other words, it is necessary to be able to "crank" the motor on a "retarded spark," and the timer should be put back in such a way as to enable you to crank with safety. But it is not a good idea to waste any more of the whole range in the cranking part than is necessary.

In relation to the question of correct timing, THE AUTOMOBILE of November 5, 1908 (page 639), will give you more information than will be possible here in limited space. The fact that all the valves are on one side of the motor will not alter the plan.

MOTOR KNOCKS WHEN THE SPARK IS ADVANCED.

Editor THE AUTOMOBILE:

[1,736.]—In a four-cycle gasoline motor, is the charge of gas, when the spark is advanced, ever fired before the piston reaches high center on the compression stroke, or does it always fire, when the spark is advanced, at the point of highest compression? Why does a motor knock if the spark is too far advanced?

New York City. A. B. E.

The mixture will fire when the spark is given if it is inflammable. Generally it is true that the mixture is fired before dead center (under running conditions) and the mixture is so slow burning as to take some time for the same to reach the state of complete combustion. Indeed, it is the case that (with the exhaust manifold off) the flame will "spit" after the exhaust valve is opened. This is but a sign of the fact that the combustion is not completed, even when the piston has traveled the whole stroke.

If the mixture is "quick," it is possible to cause the knock by the early increase in compression which follows ignition before the piston reaches the top of the stroke.

LEAKAGE AROUND THE SPARK PLUGS.

Editor THE AUTOMOBILE:

[1,737.]—The spark plugs and pet cocks on my car set in brass caps which screw into the cylinder head. There is a bad leak of compression around the thread of all these caps. Is there anything which I can put on these threads to make a tight joint—something corresponding to red lead on the thread of a gas or water pipe? W. T.

Newton Center, Mass.

Take of yellow oxide of lead enough to make a paste for the purpose. Mix the same with glycerine (quite free from water) to form a paste of a good consistency. Use the same directly after mixing and allow it to set. It will set in half an hour, and it will attain great hardness. The glycerine must be free from water to attain the best results; which is not always the case.

BEST HARD LUBRICANT TO USE IN THE TIMER?

Editor THE AUTOMOBILE:

[1,738.]—Would like to ask what kind of a lubricant would you recommend for the inside of a timer? Also, how to clean the inside of an exhaust manifold? I cannot get at the inside with a scraper. LOWELL S. ELLIS.

Warren, Mass.

A non-acid, non-mobile, hard grease is the best for the purpose. It should be of the "mineral" series; a hydrocarbon, in fact. Write to some of the advertisers of products of this sort; they will be found in the advertising columns of THE AUTOMOBILE.

Use kerosene oil. If you can have the work done by a sand-blast, the process is quicker.

BUT THE CAR WILL BE KNOWN AS THE "TOLEDO."

Editor THE AUTOMOBILE:

[1,739.]—On page 209, issue of January 28, we notice an article on the sale of the Toledo plant of the Pope Motor Car Company. We desire to make two corrections. One is, that the name of the new company will be the Apperson-Toledo Motor Company, but the product will be called the "Toledo," not the Apperson-Toledo, as stated in your article. A correction of your former article will probably avoid some misunderstandings and confusion.

Richard D. Apperson, the head of the syndicate purchasing the new plant, has never been interested before in the automobile business and has no connection whatsoever with anyone at present interested. THE TOLEDO MOTOR COMPANY,

Toledo, Ohio. F. C. Gilbert, Sales Manager.

FRANKLIN LAMINATED WOOD FRAME.

Editor THE AUTOMOBILE:

[1,740.]—In looking over your issue of January 21 we note on page 140 you refer to the Franklin wood frame as being armored. The chassis frame of the Franklin car is made of wood, laminated, and is not armored, and by reason of the fact that it is not armored, the shock and vibration which is ordinarily transmitted when steel is used, armored or otherwise, in the sill, is entirely eliminated.

We call this matter to your attention, thinking perhaps you will desire to make correction. H. H. FRANKLIN MFG. CO.

Syracuse, N. Y.

MID-WINTER GOSSIP OF THE AUTO CLUBS

QUAKERS APPEAL CONTEST BOARD DECISION.

PHILADELPHIA, Jan. 30.—Although recognizing the jurisdiction of the A. A. A. Contest Board in the matter—with reservations—the contest committee of the Quaker City Motor Club does not propose to abide by the decision of the national committee in removing the disqualification imposed upon the Premier entry in the New Year's run, and will go over Mr. Hower's head with an appeal to the executive committee. It will be remembered that Chairman Hower's committee, to which the Premier people carried their case, decided that, in the absence of a specific rule covering the case in the regulations governing the run, the Quakers were not justified in disqualifying the car for having covered the hardest part of the Giant's Despair hill without its passengers, and removed the penalty.

Inasmuch as the A. A. A. had no set rules for the conduct of endurance runs, and in view of the fact that the run was conducted under rules promulgated by the Quakers themselves, a committee of the latter went to New York on January 22 to protest against the A. A. A. Contest Board's decision on the ground that under the circumstances the national body had no jurisdiction in the matter. The Quaker committee's idea was to argue the question of jurisdiction before the A. A. A. Contest Board and to abide by its decision.

The committee, therefore, repaired to New York on the 22d, but Chairman Hower absolutely refused to listen to any argument on the question of jurisdiction. The Quakers considered this action arbitrary, and it is understood that at one point the verbal combat became quite warm, and that the diminutive but doughty chairman ordered G. Douglass Bartlett, the Quaker's counsel, from the room. The latter asked Mr. Hower if the order was made as an individual or as chairman of the committee. The chairman replied that the order was made by him as chairman. Lawyer Bartlett, smothering his rage, turned on his heel and left the room, followed by the other Quaker.

On their return to this city a meeting of the Quaker City Motor Club Contest Committee was immediately called, at which it was unanimously decided to carry the case to a higher court, and the next day a formidable appeal, under no less than 22 heads, was sent to the executive committee, praying that the latter "review this whole matter, including the conduct of the chairman of the Contest Board, who arbitrarily stifled the freedom of speech and of argument on this subject."

The rank and file of the Q. C. M. C. seem to be of the opinion that the treatment of their representatives by the A. A. A. Contest Board, apart from the feeling that they have a good case and should have been given a hearing, was most arbitrary. Even the most conservative among them believe that a back-down now would be cowardly, whereas a patient hearing, followed by a reverse decision, would have been accepted uncomplainingly.

CLEVELAND AFTER GOOD ROADS CONVENTION.

CLEVELAND, Feb. 2.—There is a very fair chance that Cleveland will secure the 1909 Good Roads Convention, the local automobile club and the Chamber of Commerce having united their efforts to land the honor. The automobile club has already guaranteed the $7,500 necessary, and a number of other cities have withdrawn in favor of the Forest City.

Cincinnati was one of the cities contesting for the honor, but withdrew to give Ohio, represented by Cleveland, a better chance.

The meeting place may have some effect upon the starting point of the 1909 Glidden tour, according to Chairman Hower, who has been in communication with interested parties in this city. If the Cleveland manufacturers send in their entries for the tour early enough, and the convention comes here, the chances will favor Cleveland, although both Detroit and Chicago are making strong bids for the honor.

PITTSBURG A. C. ACTIVE IN GOOD ROADS WORK.

PITTSBURGH, Jan. 29.—At the invitation of the Automobile Club of Pittsburgh, D. Ward King, of Missouri, and the inventor of the famous King split-log drag, addressed a gathering of about three hundred at the old Monongahela House regarding the maintenance of dirt roads, this afternoon. Secretary Paul C. Wolff, of the club, had sent invitations to the road supervisors and selectmen throughout Allegheny County and to quite a few in the adjoining counties, and the response was most gratifying. William N. Murray, vice-president of the Automobile Club of Pittsburgh, presided in the absence of President Kneeland, others at the speaker's table being County Road Engineer George T. Bramsley and County Commissioners J. K. Campbell and Stephen J. Toole.

Mr. King earnestly impressed himself upon an audience, every member of which was an enthusiast for good roads, but not a few of whom doubted the efficacy of the King drag to help the dirt road.

"Dirt and water make mud any place in this country," said the speaker, "and you folks who can remember when you used horses, as I'm speaking for the Automobile Club of Pittsburgh now, must remember that you will never be through taking care of any kind of a road. I have never placed myself on record as stating that a dirt road cared for with the King drag would be as good as a macadamized road, but out of the 1,700 miles of road in Allegheny County, only about 400 are macadamized at present, so that you will have plenty of time to try out the King drag before they are all converted, and that is all I ask you to do; try it. I have seen many a macadamized road that was not in as good shape as a dirt road properly cared for."

Mr. King spoke for an hour, and a second hour was consumed in answering questions.

Secretary Wolff, of the Automobile Club of Pittsburgh, then reminded his hearers that the chief reason for calling the meeting was to renew the club's offer of $300 in prizes for the best kept stretches of dirt road during the coming season, this amount being divided into a first prize of $100, two of $50, and four of $25. Last year the club sent out a general letter to every road supervisor in Allegheny County," said Mr. Wolff, "and did not receive a single reply. A second letter to the same effect fared no better. Mr. King has asked you to try the drag and the Automobile Club of Pittsburgh not only asks you to do likewise, but will pay $5 to every man who will build a King drag and use it but once."

County Road Engineer Bramsley then spoke, offering his services in aid of any of the road supervisors who wished to appeal to him. Anyone who was interested in the cause of good roads could find him at his office at any time, and he would be glad to extend every possible aid. Vice-President William N. Murray of the Automobile Club of Pittsburgh, then thanked the road supervisors for having attended in such large numbers, and a very cordial vote of thanks to the Automobile Club for having called the meeting was passed.

SAN FRANCISCO MOTOR CLUB.

SAN FRANCISCO, Cal., Feb. 1.—The runs and tours committee of the Automobile Dealers' Association has scheduled the first event for the automobile season of 1909. The event has taken the shape of a 200-mile endurance run to be held on February 7. The course is one familiar to every local motorist, being a double century around San Francisco Bay. A time limit of five and a half hours has been set by the committee after a careful examination of the roads had been made.

The San Francisco Motor Club will be asked to handle the event for the dealers, which makes the occasion notable, as this will be the initial bow of the club in such active capacity.

GROWTH AND STABILITY OF SLIDING GEARS.

Despite all attempts to do away with the sliding gear method of rendering automobile power plants flexible, it has grown and it has prospered. Besides doing the work in a manner quite up to a fitting standard, the sliding gear is proof positive of the fallibility of man, for in all truth no man living will be willing to say anything but that the sliding gear is based upon the most bungling theory of all; if, indeed, it has a theory of a positive character to back it up. The fact of the matter is the sliding gear seems to be the one way that is left, unless it would be more proper to say, it is the one way so far discovered by means of which motors are rendered flexible to a degree sufficient to serve for the purpose beyond the range of the planetary gearset.

True, in the classes of cars so designed as not to require a multiplicity of speed ratios, the planetary set seems to serve the purpose most adequately. When, however, it is necessary to afford more than two speeds ahead, it is the sliding gear that is used, and that it does serve the purpose to a vast extent is self-evident. This is in the face of innumerable predictions to the contrary, and it shows conclusively the fact that sturdy mechanicians can make a successful fight.

So it has been all along the line, when reasons could not be evolved, necessities urged, and while there has been considerable work to do over again, it has not been shown, as yet, that the sliding gear principle of transmitting power is included in the category of temporary expedients. It affords the requisite flexibility, and in view of the advances made in materials, especially in knowledge of the "treatment" which will accentuate the kinetic properties of them, the sliding gear principle has advanced to a seeming permanent place in automobiles, and, strange to relate, in the hearts of users as well.

* * *

PATRIOTIC WEST WAITING FOR CHICAGO SHOW.

In examples of patriotism pure and simple, the effete and erudite East is sadly lacking, but as one goes farther and farther West he finds increasing examples of it existing in all its pristine vigor. Along the Mississippi River the examples of it are to be found at every turn, taking as it does the form of local, or perhaps a better word would be sectional, patriotism. Thus the coming Chicago show will display something very much on this order, when thousands who could have attended the New York shows but refrained from so doing in order to further the cause of the national show with all the best features of the other two, will turn out. This rolled-into-one display is looked upon as the only real show. Thus, the inhabitants, with true local pride, stay away from the allurements of Broadway so as to be blown along Michigan avenue. These hustling Westerners will have their usual very good show, will sell a very large number of cars, generally transact a huge volume of business, and probably outdo all former exhibitions in point of attendance in the week intervening between February 6 and 13.

* * *

WHAT IS THE TRUE ANSWER?

According to the census of the Department of Agriculture the number of horses in the United States has increased enormously in the last few years, despite the wide use of automobiles. The statistics of the department show as follows:

Jan. 1, 1898: 13,960,911 horses, valued at $478,362,407.

Jan. 1, 1909: 20,640,000 horses valued at $1,974,052,000.

The increase in value is in part due to the fact that the unit price was $34.26, January 1, 1898, while the price per horse was figured on a basis of $95.64, January 1, 1909. The fact remains that the number of horses increased some 7,000,000 in the interim of time. Why? When the automobile began to assert itself, in other words, when it was rendered apparent that the automobile was a practical device, capable of doing the work of goods transportation, the breeders of horses reduced holdings and the actual value of horseflesh fell to a low figure. It was then that the automobile enthusiast swelled out his chest and rent the air with his claims to the effect that animal transportation was bound to fall out of existence. The facts were not all in for the reason that the automobile industry proved incapable of turning out enough automobiles to handle the merchandise of the market, and with a widely growing trade it became necessary to fall back on horses to a vast extent. This year may make for an output to indicate that a considerable increase of the commercial business can be handled.

WHAT PROPOSED NEW JERSEY LAW CONTAINS

TRENTON, N. J., Feb. 2.—Interest centers in the Colgate automobile measure, which amends the present Frelinghuysen law by prescribing that all automobiles to travel in this State must have a plainly audible trumpet signal; must carry exhaust pipes directly parallel to the ground or turning slightly upward; the Commissioner of Motor Vehicles to receive all complaints for violation of the speed laws, the same to be in writing and verified; he must investigate them within 30 days from their recept, and if in his judgment a case can be made out he can cause a warrant to be sworn out and placed in the hands of a Justice of the Peace for adjudication in the municipality where the alleged violation took place.

Non-residents of this State, when displaying their identification license numbers of other States, are to be allowed to tour in New Jersey for 10 days without taking out a New Jersey license within one year, when they pay a fee of $1 to the State Commissioner of Motor Vehicles.

The measure forbids the use of a muffler cut-off in cities or towns or within 500 feet of any other vehicle. The speed limit in the open country is changed to 30 miles an hour and exempts drivers from penalties regarding maximum speed limit unless the excessive speed shall be proved to have been continued for at least one mile. Complaint may be made and proved before the State Commissioner of Motor Vehicles upon his conceiving that there be cause after investigation, and within 30 days shall cause the person to be apprehended in a summary manner before a Justice of the Peace or any committing Magistrate in the municipality where the law was violated.

A companion bill to this Colgate automobile regulator is a measure also introduced by him, compelling the placing of lights on all vehicles of any class using the highways from one hour before sundown to one hour after sunrise, this white light to show at least 250 feet. A penalty of $10 is provided for failure to comply.

ONE SUIT AGAINST THE NEW JERSEY LAW.

The test case commenced last Summer by the touring board of The White Company to test the validity of the New Jersey automobile law, popularly known as the Frelinghuysen law, has now reached the Supreme Court of the State. Judge Reed of that court recently granted a writ of certiorari, thus permitting the case to be argued within the next few weeks. The case has been through the Police Court and the Court of Common Pleas, but neither of these courts undertook to pass upon the constitutional questions involved, but simply ruled on the facts of the case and the working of the statute.

It will be remembered that the case originated with the arrest of R. H. Johnston, in Trenton, because no New Jersey license number was displayed upon his machine. The principal contention of The White Company is that the State of New Jersey has no power to tax a non-resident citizen.

SAVANNAH MAY WANT TO HAVE ANOTHER.

SAVANNAH, Ga., Feb. 1.—The Savannah advertising fund will receive a sum of not less than $12,500 from the receipts of the Grand Prize and international light car races.

The executive committee of the club held a meeting at the Chamber of Commerce, Friday night, and went over the bills that had been paid and ordered a great many more paid. Bills of all sort of expenses rained down for a time, and it looked as if the fund might be swept away, but finally the storm ceased when the figures had reached a sum a little above $13,000, and there they stood when adjournment for the evening was taken.

The accounts showed that a little over $19,000 was received from the sale of grandstand seats. The A. C. A. turned in from seat sales and entrance money, $7,400; privileges netted $2,049.65. The railroad sold seats aggregating $3,000. The total receipts from all sources was not far from $45,000.

CHICAGO OFFERS SPECIAL CUP FOR GLIDDEN

CHICAGO, Feb. 1.—Formal announcement has been made by the Chicago Motor Club that it has offered a trophy to the A. A. A., to go to the car making the best showing in the consumption of fuel in the annual Glidden tour, which offer has been accepted by Chairman Hower. That official has not as yet outlined his rules regarding the competition for this cup.

So far as the rules for this economy test go, they undoubtedly will be about the same as prevailed in the local 1,000-mile reliability last fall in which the Standard Oil Company trophy was put up and was won by Ray McNamara in a Premier roadster. This was decided under the formula originated by the Chicago Motor Club, in which the result is arrived at by dividing the weight of the car and load as expressed in pounds by the weight of the gasoline consumed in ounces.

SPACES ASSIGNED FOR NEWARK'S SHOW.

NEWARK, N. J., Feb. 1.—With the allotment of spaces for the second annual automobile show to be held in Roseville Armory, February 20 to 27, success is assured, for the present number of applications lack just four of filling all the available space, and

Essex Troop Armory Where Newark Show Will Be Held.

these, too, are of a very high grade. The show will be purely a Newark exhibit, every local concern being represented.

An elaborate musical program is being arranged. Sweet's orchestra has been engaged again this season, and this feature will be particularly attractive.

LATEST FROM NEW YORK LEGISLATIVE MILL.

ALBANY, N. Y., Feb. 3.—Assemblyman Marks, of New York, to-day introduced a bill which looks as though it came fresh from some insurance office, as it provides that every automobile owner on taking a license shall file with the secretary of State a $10,000 insurance policy to pay all losses and damage claims arising from any one accident, without regard to questions of negligence or contributory negligence. It also provides for filing a similar policy of $2,000 by chauffeurs to protect for damages to vehicles and for damages for which the owner becomes liable over $10,000.

AUTOMOBILE ENGINEERS SELECT SECRETARY.

President Henry Hess, under direction of the council, has arranged with Alex. Churchward to become active secretary of the Society of Automobile Engineers. The society is to be congratulated upon securing a well-known engineer of such high standing in the profession to represent it in this capacity. The new secretary will assume the duties by March or April 1, to suit the convenience of the retiring secretary. The society expects to open a permanent office.

Testing Out an Inter-State Over Winter Roads.

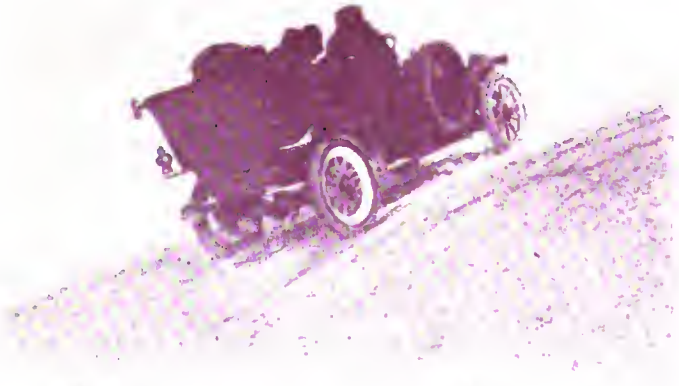
TESTING OUT CARS OVER WINTER ROADS.

MUNCIE, Ind., Feb. 1.—In the process of testing cars every opportunity which will impose unusual and gruelling conditions upon the machine is always accepted with alacrity. For this reason the snow storm of last week was welcomed by the automobile manufacturers in this section as affording them additional chances of putting their cars through the hard work required by winter roads. The accompanying photograph is of an Inter-State car, with Chief Engineer Claude E. Cox at the wheel, Sales Manager D. W. Henry beside him, and Lawrence A. Hart in the rumble seat. This party covered the route from Indianapolis to Muncie, a distance of 57 miles, in 2 hours 28 minutes.

PACKARDS HAVE ROUND-THE-YEAR TRY-OUTS.

Winter testing forms a large part of the experimental work of the Packard Motor Car Co. The several experimental cars manufactured each season—a year or more in advance of the regular product—are driven many thousands of miles in hard overland trips by the executives of the company, as well as by Chief Engineer Huff and others. Recently when M. J. Budlong, president of the Packard Motor Car Co., New York, was at the Packard factory, he, in company with President H. B. Joy and S. D. Waldon, general manager, devoted considerable time to hill-climbing experiments on the steepest snow-covered grades in the vicinity of Detroit. These tests were accepted as convincing proof of the hill-climbing ability of a Packard "Thirty" and served to reinforce the tests and demonstrations made over the same hills in the summer time.

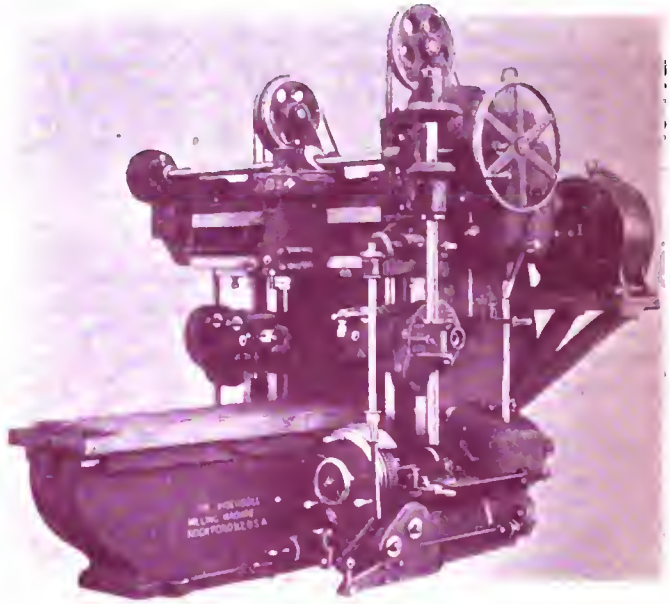
No change is made in the Packard car, say its makers, from one season to another until the new feature has been thoroughly tried out under all conditions of traveling and in both Summer and Winter weather. Thus, the construction contains nothing which has not had in actual road work harder and more trying service than it will ever be subjected to.



Busy Packarditeș: President Joy, Manager Waldon, M. J. Budlong.

AUTOMOBILE TYPE MILLING MACHINE.

ROCKFORD, ILL., Feb. 1.—The manufacturer has been more interested in machining processes and machines than the public, but now the latter is showing more interest on the assumption that if the machining processes are not right, the resulting product cannot be right, and inversely correct machine work makes a fine car. The automobile and its parts from the first have required many intricate parts which the ordinary machine tools would not handle. The great number of these special parts to be machined have given rise to the production of the milling machine shown in the accompanying illustration. This the manufacturers, the Ingersoll Milling Machine Company, call the Automobile Type Milling Machine. It is made particularly for milling engine bases and transmission cases for automobiles. It is not only adapted for this, but also for any other work which may be machined on a planer or milling machine. The three spindles have speeds varying from 15 to 120 r.p.m. These are arranged for face mills up to 10 inches in diameter on steel or cast iron, but for aluminum work larger cutters may be used. The machine has capacity of 26 in. horizontally and 24 in. vertically.



New Automobile Type of Milling Machine.

The motor equipment consists of a 15-horsepower d.c. shunt wound Westinghouse type S motor, which is mounted in the rear of the machine, where it takes up little space and does not interfere with the work nor the operator. The speed changes from 875 to 1,500 r.p.m., are effected by variations in the shunt field by means of a Westinghouse drum type controller, not shown. In addition to this range of speed there are four changes by mechanical means, enabling the cutting speed required by the work to be obtained with exactness and with certainty.

TAFT WILL HAVE HIS AUTO AFTER ALL.

WASHINGTON, D. C., Feb. 2.—After the prolonged Senate debate of the previous week, which resulted in the elimination of the $12,000 automobile appropriation from the Urgent Deficiency bill, commented upon in these columns, the House to-day made short work of this same item. A very short and spirited debate resulted in an overwhelming vote in favor of insisting upon the retention of this provision in the bill. The vote of 185 to 27 showed very clearly the favorable sentiment, which one representative expressed very well when he said in part: "If it would conduce to the comfort, happiness, and well being of the chief executive, the money would be well expended, not only every four months, but every month in the year." In connection with the Senate's previous opposition, it is notable that the stable appropriation of $35,000 will be at Mr. Taft's disposal to purchase automobiles if he sees fit, even if the Senate refuses to pass the item.

WRIGHT TRIUMPH IN EUROPE IS COMPLETE

PARIS, Jan. 27.—At a reserved table in the dining hall of the Automobile Club of France five men were united for lunch. It was a private gathering, entirely without ceremony, but one of more than ordinary importance, as was evident from the attention given to it by the maitre d'hotel and the deference of the usually impassible yellow-breeched waiters. The French "Tire King" presided, the position to the right of M. André Michelin being occupied by Wilbur Wright, now "King of the Air," and that to the left by Orville Wright, recently arrived from Dayton. The two remaining seats were filled by Hart O. Berg, European manager of the Wright brothers, and by M. Clauss. When the dessert was served M. Michelin brought forth his surprise in the form of twenty crisp bank notes of one thousand francs each and handed them over to Wilbur Wright, with the remark that he had paid the first portion of his debt for the magnificent performance at Le Mans on the last day of the old year, and hoped to present the work of art very shortly.

Before expressing thanks Wilbur Wright counted out ten of the notes and handed them over to his brother without a word; the two were engaged in the same task, and a victory for the one was a victory for the other.

For seven successive years M. Michelin has engaged himself to hand over a similar amount to the aeronaut fulfilling conditions laid down by an independent committee. The first sum has been won with such a lead on the minimum distance imposed that the donator had reason to suspect that his $20,000 for a flight from Paris to Clermont-Ferrand would not be allowed to lie in the bank for very long. Wilbur Wright assured him, however, that he would not attempt to win the big prize this year.

"Although we have covered more than half the distance from Paris to Clermont-Ferrand," said he, "there are so many difficulties on this trip that I do not think anybody will attempt it this year. It is not the distance that is the greatest difficulty, for with suitable training it is possible to fly almost any distance; the difficulty is that to reach your city it will be necessary to pass over very varied country, descending into valleys, then mounting to great altitudes, thus meeting with varying currents and wind from every quarter. The ideal for an aviator is to fly in a constant breeze, and to approximate this ideal it will doubtless be necessary to make considerable detours to reach Clermont-Ferrand. Then it will be a difficult matter to climb the sides of the Puy de Dome, the summit of which is nearly 5,000 feet above the sea level; the plan that suggests itself is to keep near the face of the mountain and climb as a bird of prey does, but even this is not an easy matter."

The Wright brothers' triumph is complete in Europe, for in addition to winning the most important prizes of the year, they have now enrolled one of their formerly important rivals as a pupil. Leon Delagrange, at one time record man of Europe, has decided to buy a Wright machine, and will take lessons from Wilbur Wright during his stay at Pau. Henry Farman, too, in view of his repeated failures, or only partial successes, has sold his Voisin Frères machine and will make a fresh start with an aeroplane built according to his own ideas.

Wilbur Wright has left Paris for Pau, in the Pyrenees, and will be joined by his brother Orville and his sister, Miss Katherine Wright, in a few days. The next item in their program is the training of the three pupils required under the Lazare Weiller conditions. This work will be undertaken by Wilbur, while Orville will rest and endeavor to recover complete strength under the genial climate of the Franco-Spanish borderland. Six aeroplanes have to be built for the committee, and it is Orville Wright who will supervise the construction. By the end of March or early in April it is believed that all will be finished and the entire party will leave France for America.

An extension of time has been granted by the United States Army Department for the fulfillment of the contract that Orville Wright was engaged in when the unfortunate accident last September laid him low.

In conversation with THE AUTOMOBILE representative, Orville Wright declared that he had full hopes of being able himself to carry out the program. "The doctor did not think I should be able to fly again before the middle of the Summer, but at the rate I am progressing I have every hope of handling a machine at Fort Meyer before the month of June. The conditions are difficult, comprising a speed test of five miles out and five miles home and an endurance test of one hour at a speed of not less than forty miles an hour, each one to be made with a passenger on board. The short speed test is an exceptionally difficult one, for we have to fly over the rough, hilly ground around Fort Meyer, where variations in the direction and force of the wind are frequent. I have such confidence in the machine as to believe that we shall succeed."

Aeronautical conditions are becoming better in every way in Europe, where the scepticism of the earlier time is not now much of a factor, and there is no denying the fact that success depends upon the attitude of all who may influence the situation.

CHATEAULAND NOW WANTS AEROPLANE MEET.

PARIS, Jan. 27.—Anjou, robbed of its Automobile Grand Prix, has abandoned all idea of running a race itself, and will seek fame in the organization of a large aeronautical competition. The subscriptions obtained toward the 100,000 francs subvention for the Automobile Club of France will be returned in their integrity, the French club being asked to meet the expenses incurred in obtaining the money and in preparing for the defunct race. One village on the projected course is so vexed at the loss of the race that it has put in a claim for an indemnity that will doubtless not be forthcoming.

The aeronautical program is at present in an embryo condition, but doubtless the manifestation will develop into an aeroplane race from Angers to Saumur and return, a spherical balloon competition and a demonstration by dirigible balloons. The dates chosen are the last week in September of the present year. The Aero Club of Francie will associate itself with the district in the organization of the meeting.

WHAT THE AERONAUTICAL FEDERATION DID.

LONDON, Jan. 27.—A prize of $240,000 for aviation and dirigible balloons has been founded by the International Aeronautical Federation in its meeting here. A gold cup of the value of $10,000 will be awarded to an aeroplane; money prizes of $20,000 each will be given to dirigible balloons and flying machines, and a $10,000 cup will be awarded in each section. The ten prizes of $20,000 each are to be competed for at intervals of five years. In addition, the sum of $20,000 will be devoted to the construction of sheds for the competitors in these events. It is suggested that the United States, Germany, Great Britain and France should each contribute $40,000, Belgium, Spain, Italy and Austria each contributing $20,000.

Rules have been decided upon for the Gordon Bennett aeroplane race to be held in France this year. The race will take place around a fixed course five to ten kilometers in circumference, the minimum distance traveled to be officially recognized, being fixed at twenty kilometers. Stops may be made during

the progress of the race, the competitors to start off again under their own power and without outside assistance, the winner being the one making the fastest time. The race must take place at a fixed date and at a fixed time.

With reference to the recent friction between the Aero Club of France and the Automobile Club of France, the following proposal by Roger Wallace, on behalf of America, was carried: "The International Federation decides that any affiliated aeronautical club is free to act in its own country and can enter into any arrangement with another organization, but only on condition that it maintains in all its integrity the fundamental statutes of the federation." The situation will be watched with a good deal of interest, and that this, like every other problem, will be solved in a fitting manner, is fully anticipated.

THIS, THE CONGRESS OF A GREAT COUNTRY.

WASHINGTON, Feb. 2.—Having adopted an amendment to the army bill last Saturday, carrying $500,000 for airships of various types, the House to-day reversed its action and by a vote of 161 to 90 defeated the amendment. The vote on Saturday was in the Committee of the Whole House and the reporting of the bill for final passage to the House itself to-day gave Mr. Tawney his opportunity for renewing his opposition to the measure. There was no debate. Mr. Tawney simply asked that the amendment at issue be voted on separatcly and the overwhelming vote was taken.

The only hope for the airships now is that the Senate may restore the appropriation and insist upon its amendment in conference. But that is extremely unlikely.

FRANCE MAY HAVE OUTLINED TOO GREAT A TASK

PARIS, Jan. 27.—In her enthusiasm for flying, and eagerness to secure first position in the aeronautical world, France has mapped out for herself a program which is going to lead her into difficulties. The year 1909 is to be given up to flying; aeroplane races are to be so numerous and so exciting that there will be no need whatever to hold automobile speed tests. Monaco has to set the ball rolling with a carnival calling for flights across the blue waters of the Mediterranean, rewarded by cash prizes of $20,000. The Aero Club of France, the Automobile Club of France, the Anjou District, and a host of othcrs are to have speed tests for machines that navigate the air. The time for action has arrived, and France has awakened to thc fact that she has set herself a task she is by no means able to accomplish.

For the soar across Monaco Bay there are nine entrics of as many magnificent machines, produced with much scientific skill and lacking in nothing but the ability to fly. The list is headed with three Antoinettes, masterpieces of fine workmanship, which up to the prescnt have only accomplished a couple of miles in the air between them. Breguct has a biplane and a gyroplane, which may have flown, but if so no one but the pilot ever witnessed the performance; Baron de Caters has a Voisin biplane which on one occasion rose from the earth, and Georges Vuitton has a helicoptere which has not yet peered forth into the light of day. Leon Delagrange is the only aeronaut in the group having a past that would entitle one to believe him capable of fulfilling the Monaco programme. He has put in two machines, one of which he will handle himself, the other being in charge of an assistant still in his apprenticeship. Even Delagrange will have to make a much more brilliant showing than ever before, his best flight up to the present being 10 1-2 miles, while the Monaco event calls for three flights of over six miles each, starting from a given point, rounding a windy promontory, and returning to the same given point. Quite an undertaking.

Henry Farman, the champion of the French school, has temporarily retired from the fray. A few days ago he sold his Voisin biplane which he had himself transformed into a triplane, and has now taken up the ungrateful task of teaching his constructor how to build an aeroplane. As the constructor is convinced that his machine ought to fly, and Farman believes that he has learned enough during his eighteen months' apprenticeship to build an acroplane, there is a deadlock, the outcome of which is not easy to foresee.

The only other men who have done more than scutter over the ground are Louis Bleriot and Robert Esnault-Pelterie. The former has produced two new "racers," which might fly if their whcels would stand up long cnough to allow them to get into the air. Esnault-Pelterie has shown an ability to fly, but at such widely spaced intervals that hc cannot be rclied on for a race at a fixed date, assuming he can make good at all.

The failure of the French school makes the American triumph still more striking, for the fact cannot be denied that the only really successful machinc at present in existence in France is that owned by Wilbur Wright at Pau. More Wright machines are undcr construction, and pupils are being trained, so that there is a possibility that the prizes which might otherwise have to remain without winners will be carried off in triumph. The race at Monaco, however, is likely to remain a blank, for Wright is somewhat opposed to taking part in anything of even a slightly sensational nature, and is further so anxious to return to the States that it is doubtful if he could race were the conditions such as suited him.

Before the cnd of the year there may be a score of Wright machines in commission in France, and if, as the inventor declares, it is not an acrobatic feat to handle them, some of the cash prizes that France has so lavishly created may have to be handed over. It will be a sorry day, however, if 1909, the triumphal year of the aeroplane, is only conspicuous for the success of an American production.

First Appearance of the Smaller Bleriot Monoplane, Fitted with Antoinette Motor, Which Successfully Flew January 20.

ROUGHING IT A LA MOTOR, AWAY FROM ROADS

By MONTGOMERY HALLOWELL.

ARE you one of those blasé old autoists? Have you used up every charming stretch of road within the week-end radius of your town? Have you exhausted all the thrills that the first two or three years of automobile ownership kept shooting into your system? Are you in that just-waiting mood—wondering whether the next new thing to interest you will be anything short of an airship?

Well, here's a new one that will revive every old joy of your early days of autoing.

"Roughing it"—that's the answer.

Seven of us: Major Foster, Page, Fitch, Ayres, Chalmers, Dowling, and myself were at duncheon. I don't know how it started, but before the coffee got to us we had begun to tell hunting yarns. And every man in the party began to feel that crazy longing that no city-bound, asphalt-weary, business-burdened working man ought to feel until vacation time—that longing for the woods and the wild things of nature. The Major was the inspired human being who sprang the idea.

"Getting there and getting back is what kills hunting for us chaps." Page had just said "Here it is Friday noon. From now till Monday morning we could all be out shooting except for one thing—there wouldn't be any shooting. It would be all traveling—out and back again."

The Major carefully put away what was left of his coffee and as carefully set down the cup. He didn't seem to have a thing on his mind.

"Well," he said, casually, "you know," just as if it were nothing at all, "we might do the trick with a car."

Autoists In Camp In the Woods of Southern New Jersey.

The next five minutes developed a lot of things. The Major knew a place somewhere back of Lakewood, where, by starting that night and allowing six hours for sleep, we could be on the birds early the next morning. Fitch suggested making it a camping trip and offered to supply a complete auto camping equipment from tents, air mattresses, sleeping bags and folding stove down to teaspoons with food and every other accessory, all to be so completely folded and stowed as to leave all seats free to carry us with three guests and a guide. Page came to the front with a Chalmers "Forty" and a Chalmers-Detroit "Thirty."

"We'll sleep to-night," said the Major, "at a little place I know, about a hundred and fifty miles from here. I'll 'phone for midnight lunch and beds for nine, also for a guide and dogs. I hope those cars are all right, Page. They'll need to be. And Fitch, be sure to have a couple of axes. We may have to chop down some trees to get the cars through."

This sounded good to me—only I was glad they weren't my cars. Ten of us left Columbus Circle at 8 o'clock. At 1 o'clock we were at the little hotel, an hour beyond Lakewood. I'd like to tell about the fun of that run. But it was just a case of good roads, good cars, a beautiful night and speed.

Next morning the real fun started. With Captain Jenks, our guide in the leading car, it took those blessed cars just fifteen minutes to land us in the very heart of the bird country. Over deep sandy roads and through the timber—the cars never turned a hair. To have walked it would have taken an hour. Who says that motoring isn't the real way for busy folks to go a hunting? We had only two days and the cars were saving every minute for us for sport.

Then came another novelty to some of us—Fitch's camping layout. To see the Major and Fitch and Dowling transform the rolls of plunder that had been strapped to the running boards into a complete camp in less than ten minutes was better than any mere fire drill I ever saw. Nothing needed to live, move and have your being out of doors was missing; and everything was made to fit into everything else so that not an inch of space was lost in packing.

I started out to tell about "roughing it" and not about the shooting itself; but right here I want to remark that, when it comes to birds, that strip of Jersey woods is good enough for me. When we got back to camp at noon not one of us had had less than a dozen shots.

And that noon-day meal. How Broadway would have stared at it and the way it disappeared.

Another lightning transformation act that would make a hit at Hammerstein's ended in getting every part and parcel of that camping outfit on the cars inside of fifteen minutes and we were off for another kind of shooting.

"I guess this is bad," said Page. "Two kinds of shooting the same day. Major, I would sooner be the father of this new idea of yours than the winner of the Vanderbilt Cup." Our new destination was to be a certain inlet the Captain knew of on Barnegat Bay where he guaranteed us some good salt water duck shooting. By road it was a two-hour run. But the Captain knew some short cuts. We didn't save much time, but we got the sensations.

For a couple of miles we just wound around, picking our way through the woods with no road in sight. Talk about walking on eggs! That's nothing. Just try a ride in an expensive car through the trackless woods with an eight-inch fall of leaves hiding the holes and stumps. Once the "Forty," which was in the lead, got tight up against it, and, sure enough, the Major's prediction about the axes proved right. Before the car could make a get-away, the Captain had to chop down a couple of six-inch trees.

At the edge of the woods we struck a ploughed field and we began to wish the Captain had given us plans and specifications of his boasted "short cuts." However, the cars didn't seem to mind and finally we came out on a road. It was a welcome sight too—even if it was deep sand. Page knew what his cars would do to that sand, so he threw on the clutch for a little speed.

The sand didn't last long and, for a wonder, we struck a piece of ordinarily good country road. The "Thirty" was loaded almost pound for pound with the "Forty," and when Page opened up on his fourth speed I looked back to see the "Thirty" fade away. But, apparently to the surprise of even Page himself, the

smaller car kept in sight all the way. After a fairly stiff climb of about a mile, we struck the decline leading down to the beach, and, after another couple of miles through the woods, we halted at a spot that the Captain had chosen for our camp-sight for the night.

The short winter afternoon was not yet nearly over and we were in plenty of time to pitch camp and spread out around the inlet before the ducks would be coming in.

For a couple of miles we were strung out along the edges and indentations of the little bay. And pretty soon the guns began to "Bang," "Bang" all over the place. The birds were coming in thick. Everybody was busy and the dogs were beside themselves.

Why—will some one tell me—why stick in the city and vainly wish for sport when it is as easy to have as this?

We had invented a way to crowd a month's vacation into forty-eight hours; but even we couldn't keep it from getting dark and soon the fun had to stop. But after all, which is the more fun—the shooting or the pipe and the talk and the loaf around the camp fire after the day's sport is done?

We found the shore too cold, and again we thanked our lucky stars for the lightning-like camp equipment and the cars. For in less than forty minutes we had picked up our traps and established ourselves again three miles back in the woods.

How good that hunter's supper was! And how unbelievable it seemed as we sat around the fire in the evening, to think that the evening before we had been in the city and that the evening following would find us back in our civilized togs, on asphalt again! How we slept that night! How we hated to crawl out of the warm sleeping bags Sunday morning—even to eat another of those wonderful out-of-door meals! And how we hated to break camp!

But we knew we could do it again—and then again. That was the compensating thought. For we had discovered and demonstrated a new idea—the tabloid outing for busy sportsmen.

The Major, Page, and Fitch were our heroes. The car and the automobile camp equipment had made it all possible.

Below is a list of the stuff Fitch furnished, barring the guns. It is every conceivable thing needed for eleven men for three full days, and all packed to leave room to spare on the cars. The total weight, including food was 203 pounds, the total cost $135.00.

Article.	Weights.	Price.
2 automobile tents	18½ lbs.	$24.70
2 dozen 12-in. steel tent pins, per doz	4¼ lbs.	.85
2 tubular steel telescopic tent poles	3½ lbs.	2.50
8 Fitch sleeping bags, Style "A"	21 lbs.	30.00
8 No. 1 air beds	9 lbs.	
2 three-quarter axes and sheaths	3¼ lbs.	2.00
1 No. 8 aluminum cooking outfit for 8 people in leatherold case, with all accessories	15 lbs.	32.75
1 large folding aluminum baker, with pan, bread board, canvas case and two broilers	8 lbs.	7.50
1 folding grate with canvas bag	3½ lbs.	2.40
4 No. 3 chairs	4½ lbs.	1.50
4 steel folding stools	2½ lbs.	.75
2 folding aluminum lanterns	7 ozs.	2.00
4 folding wash basins	7 ozs.	.85
2 folding pails	8 ozs.	.85
2 shot guns and 2 rifles in each car		discretionary
2 fishing rods, with reels, lines, hooks, files, etc.		discretionary
2 folding tables	16 lbs.	2.50
1 toilet tent	6 lbs.	3 75
2 wall pockets	1½ lbs.	2.50
1 No. 2 refrigerator basket	9 lbs.	4.00
1 folding safety saw	4 ozs.	1.00
2 military night marching compasses on each car	7 ozs.	11.25
1 No. 1 medicine case	21 ozs.	3.50
1 hypodermic syringe	3 ozs.	1.75

All of the above articles were packed in brown waterproof bags, with handles on bottom and sides. In addition to this, foods as per food list below for eight people for one week, packed in brown waterproof nine-inch bag, price, $125 (each).

	Lbs.		Lbs.
Flour	24	Rice	6
Corn meal	10	Julienne	1
Beans	6	Soup tablets	½
Erbswurst	½	Evaporated apples	2
Bouillon capsules	1	Evaporated apricots	2
Lentils	2	Salt	1
Sugar	9	Chocolate	1
R. baking powder	1	Tea	1
Coffee	2	Bacon	6

Pork	10	Shelled nuts	1
Shredded codfish	1	Dried eggs	1¼
Peerless evaporated milk	5	Dried onions	¼
Total			106½

Pepper, spice, mustard—shaker full.

IN A TOUR FROM SYRACUSE, N. Y., TO PAWNEE, NEB.

WHERE the northwest corner of Pennsylvania reaches out from the rest of the State to touch Lake Erie is a region that the automobile tourist dreads. It is a strip not over 40 miles across, but it is wide enough to cause trouble to the east or west-bound automobilist who attempts to cross it without a Pennsylvania license. To avoid it one would have to make a wide detour around Lake Erie and through Canada.

Just what the Pennsylvania proposition is is explained by George Johnson, of Pawnee, Neb., who, with a party in two Franklin touring cars, recently made a trip of 1,516 miles from Syracuse, N. Y., to his home. He says:

"While in Syracuse we made some inquiries about the routes, and were informed that the law in Pennsylvania was very stringent and that no foreign license would be recognized. Some said that they would not molest autos passing over the State road along the lake, but one man who had made the trip without a Pennsylvania license was held up and fined. The experience cost him $26. We thought best to pay the State the $3 tribute money, and we remitted to Harrisburg and had our license sent to Dunkirk, and subsequently we passed over the Pennsylvania roads without being molested."

Mr. Johnson and O. H. Schenck, of Pawnee, had just purchased the automobiles and had gone to the Franklin factory in Syracuse to drive them home. On the 1,500-mile run west they made stops at Geneva, Batavia, Buffalo, Niagara Falls and Fredonia, thence running along the route of the Lake Shore & Michigan Southern Railroad to Willoughby, and then stopping at the cities of Cleveland, Sandusky, Toledo, Swanton, Hammond and Chicago.

Although the run was made without trouble of any sort except one tire puncture, bad roads were encountered in places. "After two days in Chicago," says Mr. Johnson, "we resumed our journey, putting up at La Salle the first night out. Just out of La Salle we encountered exceptionally bad roads. Rain had recently fallen, and the further we went the heavier the roads got. At Rock River we were held up for the ferry."

At Moline the party separated, Mr. Schenck taking his car through by way of Washington, Ia., there to be rejoined by the others in Mr. Johnson's automobile, who had come by way of Rock Island and Muscatine. The reunited party continued by way of Ottumwa.

"While I have always had a pretty good opinion of Iowa and Iowa people," says Mr. Johnson, "I still have the same opinion of Iowa people; but Iowa roads, especially a strip of 100 miles out of Ottumwa, are about the worst I ever encountered. We felt somewhat relieved on reaching Nebraska City, Neb., for we knew the roads were fair from there to our journey's end"

While the jokesmiths continue to make the farmer the automobilist's foe, these tourists found him quite the contrary. "I wish to say right here that we were royally treated by the farmers along the route, and we certainly appreciated their many kindnesses," is the tribute paid by Mr. Johnson.

Austria intends setting all other nations a good example with the erection of an automobile senate at its higher courts, which is to deal with all legal questions of liability and recompense. This innovation is made by the Ministry of Justice at the instigation of the Austrian A. A.

MITCHELL THE SURVIVOR IN NEW ENGLAND TEST

HARTFORD, CONN., Jan. 28.—A 20-horsepower, four-cylinder Mitchell runabout was the sole survivor in the 156-mile endurance contest from Hartford to Pittsfield and return by way of Springfield, to-day. The time of the Mitchell was 11 hours 52 minutes, and it is estimated that at least 20 miles more than the course described were covered, so that this time is virtually for 170 miles of running. The contest was the outcome of a challenge issued by R. D. & C. O. Britton, local Maxwell agents, to all cars selling at $1,000 or less.

There were five starters at five-minute intervals; two Mitchells, two Maxwells and one high-wheeled Holsman.

Accidents were numerous from the very start. Smith and his mechanician in No. 1 Mitchell nearly came to grief almost in sight of the start. The passage up Avon mountain was a bit tortuous and necessitated skill in driving. In the vicinity of Canton the Mitchell collided with a telegraph pole, and for a time it looked as if the car was completely out of the running. The mechanician, who had been sitting on the running board, was pounded more or less, but was game and stuck to it. The left steering pivot was badly bent, so much so that the spokes of the wheel barely cleared it. With the wheel badly dished the entire trip was made. The second Mitchell followed the wrong road, and once upon it, in a desire to make up time, halted at a tree and smashed a wheel, which put it out of the contest.

The two Maxwells encountered trouble shortly after the start. The car driven by King stripped a driving pinion and was towed back to Hartford and a new member installed. Later, however, it again came to grief and gave up the contest. The Maxwell was running in hard luck. Macdonald in the other Maxwell was giving a good account of himself when Pine Meadow was reached, and here again the hand of fate was heavy. The car stripped a driving pinion and a complete new rear axle was hurried out from Hartford and again Macdonald started out for the goal. In North Becket, however, the car skidded against a stone wall and a wheel was smashed. The crew spent the night at a farmhouse. A new wheel was shipped.

A high-wheeled Holsman seemed to have the least trouble of all the cars entered. It had a difficult time negotiating Avon mountain in the snow and ice, and as the car was equipped with but improvised chain grips going was tedious. It made a consistent showing until almost into Pittsfield, when a timer gear failed and put it completely out of business.

Smith in the first Mitchell had the lead and held it. Enthusiastic testers, eager to render what help was possible in breaking roads, were humming along nicely. One of them collided with a bridge in Sheffield, and the car was completely wrecked. Smith in the Mitchell almost lost heart as the minutes passed by, and finally when it became apparent that the wrecked tester owned the bridge he took a roundabout route.

From this point on the contest is simply a narration of indomitable nerve on the part of Smith and his mechanician (who was kept up by stimulants) and Mitchell survival. Pittsfield was duly reached after some hard going. The winning crew was dined by the Hotel Wendell, and the house doctor looked over the mechanician, badly shaken up but otherwise all right.

Jacob's Ladder still lay before the winners. Smith was prevailed upon to give up the idea of climbing the noted rise, but could not be argued with. Smith endeavored to secure the services of a guide for the trip over the "Ladder," but the day was cold and the natives did not take seriously to offers of reward. Snow shovels were secured and the car was off. The entire run up the "Ladder" was made on the low gear. The radiator was kept cool with snow when water was not to be had, and time and again it boiled out. The engine, however, worked beautifully. At the top of the "Ladder" the wheels were wound with heavy rope for the descent. It was made without special incident. The run in from Chester to Westfield was hard going, and snowdrifts had to be eliminated. From this point on the journey, compared with what had already been encountered, was not so hard, though some of it was over the trolley tracks.

The winning Mitchell crew was given a good scare when Springfield was reached. Safe in the assurance, from inquiries along the way, that no other car had passed, the party stopped for a brief respite. The cars from Hartford had run up to escort the winner home, and as Smith got into his car along came King in the little Maxwell. "Where did you come from?" asked Smith. "Just got in," replied King. Needless to say Smith did some tall speculating as to how quick he could get away from King and reach Hartford first, but King then told the real story, and the Mitchell came over the road homeward at a leisurely pace, reaching Hartford at 6:52, after having run 11 hours 52 minutes. The contest was nothing if not noteworthy.

Mitchell 28-H.P. Runabout, Winner of Endurance Run.

Two trophies were offered for the contest: a handsome silver loving cup from the Hartford *Times* to the winning car and a copper and pewter loving cup donated by the Post & Lester Company for the car making the nearest best time to eight hours. Mitchell, of course, won them both. All the cars entered except the Holsman were equipped with Hartford tires. Despite the ice and snow and extraordinary rough roads not a single case of tire trouble was reported. The Buick was withdrawn from the contest the night before the start.

A. R. MILLER TO REPRESENT SIMMS IN AMERICA.

Frederick R. Simms, co-inventor and patentee of the Simms system of magneto ignition, recently arrived in this country for the purpose of appointing an American representative of the Simms Magneto Company, Ltd., and also establishing business relations with leading American automobile makers. Mr. Simms has arranged with A. R. Miller to be the American representative in charge of a branch to be located in New York City. Mr. Simms will be remembered as a founder and the first vice-chairman of the Royal Automobile Club of Great Britain and Ireland, and again a founder and the first vice-president of the Society of Motor Manufacturers and Traders. It is not improbable that the noted Britisher will be a visitor at the Chicago show.

TRADE CONDITIONS IN MEXICO CITY.

DAYTON, O., Feb. 1.—Sigmund Krausz, representing the Dayton Motor Car Company, recently returned from Mexico, where he established a Stoddard-Dayton agency. Regarding Mexico City, Mr. Krausz found Mexican dealers in general make the mistake of handling too many makes, thus considerably lessening the chances for the success of any one car. The Stoddard-Dayton agency established in Mexico City will, however, handle exclusively the product of the Dayton Motor Car Company. One of the largest garages is to be secured, and some new features introduced in the remodeling of the quarters, especially in the housing of the customers' cars.

Stoddard-Dayton on Typical Roadway of Back Street in Mexican Hill Town.

Federico Vedegaray, the newly appointed agent, will have associated with him some men well known among the Mexican motoring public, and an experienced man from the factory will look after the mechanical end of the business.

Mr. Krausz thinks the Mexican capital an ideal automobile town, as far as roads in the city and environs and general police regulations are concerned, and he is convinced that American cars, in spite of the existing prejudice in favor of the French, Italian and German machines, are steadily gaining ground there. He made many trips around Mexico City with interested autoists and the way his Models 9-F and 9-A performed over the hardest roads created a favorable impression.

AUTO EVERY 12 SECONDS.

NEW YORK CITY, Feb. 1.—Claims have long been made that New York is one of the world's greatest automobile centers, and to substantiate this a test was made last Saturday afternoon at the corner of Fifty-seventh street and Broadway. Beginning at 3 o'clock, note was made of every vehicle that passed the corner in question in both directions for the ensuing half hour. In that time, 353 cars are said to have passed up and down "Automobile Row," or an average of an auto for every 12 seconds, while but 75 horse-drawn vehicles passed there during the same period. Conditions were unfavorable for traffic of any kind.

MR. AND MRS. HOVER ARE UNDAUNTED.

NEW YORK, Feb. 3.—Unlike many of the other passengers on the ill-fated *Republic*, which went down off Nantucket before having made more than a few hundred miles on her trip across the Atlantic, Mr. and Mrs. Hover, of Spokane, Wash., who were starting the first European leg of their round-the-world trip in a Maxwell, are not discouraged by this unpleasant occurrence such a short distance from the start, and are making another try at it to-day on the *Adriatic*. The latter vessel is another White Star liner, but is bound for Southampton, from which point the Hovers will go directly to the Riviera, stopping at Nice. This will mean the postponement of the Algerian part of the trip, the change having been made owing to Mrs. Hover's ill-health and the lateness of the season. Mr. Hover's plans were more or less dependent upon his wife's recovery, but he will probably make a start on the Continent first, instead of going to Africa.

Current report had it that the Maxwell touring car in which the Hovers crossed the American continent from Spokane, Wash., to New York, and in which they intended to continue the remainder of their trip round the world, had gone down with the *Republic*. A little investigation proved this to be erroneous, Colonel Pardee, of the local Maxwell-Briscoe branch, being under the impression that the car had not been shipped at all as yet, and that it was still in New York. This was not in exact accord with the facts of the case either, as events proved, for the occasion on which Mr. and Mrs. Hover were photographed in the machine, as shown by the accompanying illustration, was the last in which it appeared in this country. That was a day or two preceding their departure on the *Republic*, and the Maxwell in its crate went out on an Italian freighter, bound for the Mediterranean, less than 24 hours before the unfortunate White Star liner set sail, so that it is now awaiting their arrival at the custom house of some Italian port, instead of being in the hold of a steamer 200 feet or more under water, as has been generally supposed. The losses suffered were confined to their personal effects.

Mr. and Mrs. H. A. Hover in Their Maxwell Prior to Sailing on the "Republic."

How One Santa Claus Adopted Up-to-Date Methods.

M. R. Hutchinson, inventor among other things of the Klaxon warning signal, lives in Summit, N. J. The electrical engineer of his organization, Jonathan Haralson, on Christmas Eve essayed successfully the role of a modern Santa Claus, utilizing Mr. Hutchinson's automobile in the distribution of a tonneau full of scientific toys which might be expected from the laboratory of an inventor. While the innovation shattered the reindeer story quite completely, the youngsters seemed to be as well satisfied with the up-to-date methods of "Old Nick." He covered his rounds much more quickly than with the old reindeer-drawn vehicle.

Proof of Interest in Pierce Arrows.—In this day of new and novel ideas a brand new one has been sprung recently in connection with the automobile shows. The idea of finding the indications of public interest in the cars took many forms, but the latest consists of looking for footprints, so to speak. As soon as 11 o'clock struck at the close of the recent Madison Square Garden show exhibitors began to move and the heavy burlap carpeting was bared. Then it was possible to gain some idea of the numbers that had visited the spaces of the various manufacturers. Some of the carpets showed scarcely any wear, while at others the wear was very noticeable. This was particularly true at the space occupied by the Pierce Arrow cars, where the carpet was worn through at seven places, four of them being about the door of Louis XVI suburban car. Every seam had been ripped by the thousands who had passed about the exhibit. This fact caused so much comment that an examination was made of other exhibits, and it was found that in no other space in the Garden had the carpet been worn through, although in three others some of the seams had been parted.

New and Larger Production Estimate.—It is a well-known fact, almost a truism, that motor car manufacturers never buy any more tires than are absolutely necessary for their season's output. Looked at in this light, the compiled figures of the tire contracts already placed allow of a newer, yet conservative, estimate of the year's production. Basing his prediction upon the number of tires actually contracted for by the various automobile manufacturers throughout the country, F. S. Firestone, the well-known tire manufacturer, estimates the 1909 automobile production at 72,500 cars. "The effect of this enormous production," added Mr. Firestone, "means a distribution for wages, materials and new tire equipment alone of more than $125,000,000. This is an increase of about 50 per cent. over 1908, and will go a long way toward restoring normal conditions to general business."

Six-Cylinder Motor Still Gaining.—Those autoists and manufacturers who predicted the speedy downfall of the "six" are gaining small comfort from the present situation. Not only is the "six" still gaining in our own country, but abroad as well. That France is becoming enthusiastic over the six-cylinder car is shown by the increasing number of "sixes" exhibited at the Paris Salon. In 1905 only three "sixes" were displayed. In 1906 the number grew to 23, in 1907 to 57, and in 1908 (last December) to 96. Practically every well-known maker in France is producing one or more six-cylinder models. Similarly at the Madison Square Garden show no less than 25 "sixes" were shown, which is 18 per cent. of the total. If the commercial cars were eliminated it would then appear that about one-fourth of the whole number are "sixes."

Old-timer Still at It.—As exemplifying the fact that some of the old-timers were built in a very sturdy fashion and built to last despite the then lack of fine materials, may be noted one Australian user of a car of the "vintage" of 1900. T. P. Williamson, of Yass, New South Wales, has converted into a delivery wagon one of the single-cylinder Wintons that were shipped to Australia in 1900. The nine-year-old motor is declared to be better than ever, Mr. Williamson stating that he gets 15-horsepower, although the original rating was 10-horsepower. This is a noteworthy record, for few cars built nine years ago are even in evidence, to say nothing of running.

Stands High in Home Town.—It is an old and very trite saying that a prophet may lack honor in his own country, but of automobile manufacturers a similar statement would not hold water. Thus the majority of manufacturers lead in their home town or share this lead with another home-maker. Statistics lately compiled in Ohio by the State automobile department show that Cleveland, the home of the Winton car, has more autoists who drive Wintons than any other single make. Cleveland-owned Wintons range from the single-cylinder of 1899 to the "six" of 1909.

A. L. A. M. Hand-Book.—The sixth annual edition of the hand-book is now out, and, besides showing more cars than its predecessors, illustrates and describes the principal models for the coming year by the association members. The press work is excellent; the book, of the same size as heretofore (folio 8vo), being contained in a smart cover. An innovation is a page giving in tabular form the horsepower ratings of the various sized motors, according to the A. L. A. M. formula. The handbook is sent, as usual, from the A. L. A. M., 7 East Forty-second street, New York City, on receipt of six cents to defray postage.

Big Factory Increase Necessary.—Owing to the great and growing demand for their cars, the Overland Automobile Company has been obliged to rent another factory, which will make the fourth. The latest is a large frame carriage building, which is at present standing idle. It was originally intended to build 1,500 Overland cars for 1909, but with the increased accommodation contracts have already been placed for parts sufficient to build 3,000, with an option on from 500 to 1,000 more. The output for Overland cars alone is already 20 per day, and by the first of February will be up to 25.

Compete with Street Cars.—Out in Pittsburg recently a company that got a "raw" deal from the railway company will start a competing line of automobile buses. It seems the Pittsburgh Railways Company refused to accept the Duquesne Incline Plane Company's transfers, so the latter will compete. April 1 an auto service will be established, running upon a four-minute headway during the rush hours, and but eight minutes apart the rest of the day. Twenty-two passenger buses of a well-known make will be used.

Inventor Will Revolutionize the Industry.—The following news item has been received: The triple-action lightweight motor is no longer a dream, but a reality. Edward van Baerle, of New York City, is now working on a model which he claims, when finished, will drive an automobile without the present transmission or clutch. It will, he thinks, make an ideal aeroplane motor, but probably would not be satisfactory in a motor boat.

Monarch Plugs Have New Factory.—The E. M. Benford Mfg. Co., maker of Monarch spark plugs, has completed its new factory building at Mount Vernon, N. Y., a handsome two-story brick structure, 30 by 125 feet, which is equipped with the most improved machinery for the manufacture of the company's products. Seventy-five men are employed under the direction of David Benford, assisted by M. Folitz as electrical engineer.

Reo Doing a Tremendous Business.—The daily sales of the Reo sales agents amount to nearly fifty a day now, with the prospect of an increase in this. A recent shipment from the factory to a Western agent was probably the largest single shipment ever made from Lansing, which is saying a good deal. This shipment of 18 carloads, containing 108 Reos, went to Wichita, Kansas.

Horses Get Another Setback.—Every day one hears of another case of the horse being supplanted. The latest is concerned

with the "bang tails," for the Crescent City Jockey Club, of New Orleans, after 25 years' successful operation, has decided to liquidate the club's affairs and convert the old race track in an automobile speedway. How are the mighty fallen!

Dolson Plant Now the Home of Motor Trucks.—The former Dolson Automobile Company's factory at Charlotte, Mich., has been sold to a Battle Creek firm, headed by a man named Messmer, and will be reopened at once. The vehicles to be built include a full line of commercial vehicles, notably delivery wagons and beam trucks.

Nadall Rim Wins Again.—In the recent demountable rim contest held in Minneapolis, Minn., by the Minneapolis Automobile Club, the Nadall demountable rim cleaned up the field once more. This winner of the first prize did the complete change in just 30 seconds, followed by Diamond and Fish in that order.

IN AND ABOUT THE AGENCIES.

American Distributing Company, Cleveland, O.—This concern announces that it now handles the output of the Hayes Wheel Company, Jackson, Mich. Formerly it handled the product of the Imperial Wheel Company, of which Mr. Hayes was vice-president and general manager for several years. The American Company also announces that it has no further connection with the product of the "Long Arm" System Company, but anticipates announcing a new connection very shortly.

Brush in Foreign Countries.—The Brush Runabout Company, Detroit, Mich., has under way negotiations with representatives in Chili, Peru, Ecuador, Venezuela, Columbia, Spain, Cuba, Porto Rico, Central America and Mexico. When the prospective arrangements are completed the Brush will have a representative in every country in the world of any importance to the automobile industry with the exception of Russia.

Oakland, Chicago.—The Centaur Motor Company of Buffalo, N. Y., general sales agents for the Oakland Motor Car Company of Pontiac, Mich., has completed arrangements for an agency in Chicago at the old Rainier quarters, 1725 Michigan avenue. Arthur M. Robbins, formerly with the Rainier branch in Chicago, will have charge.

Monarch, Pittsburg.—Among the agencies in the Smoky City is the Empire Automobile Company, who will act as a distributor for the Monarch car in the State of Pennsylvania. Branches have already been established at Uniontown, Tionesta, Oil City, Butler, Scranton and other towns.

New Lozier Headquarters.—The Lozier Motor Company is now located at 1751 Broadway, in the old quarters formerly occupied by the Hol-Tan and Rainier companies. The Lozier company occupies the entire building, necessitated by the growth of its selling operations.

American Simplex, New York City.—W. G. Isbell, Michigan agent for the American Simplex, recently closed a deal for the New York City agency of that car, and has sold his Detroit garage to Ashley Pond, Jr., agent in that city for the Stanley steamer.

Overland, Dallas, Texas.—A distributing branch for the Overland has been opened in Dallas, operated under the name of the Overland Automobile Sales Company, in charge of Mr. Funk, of the Oklahoma Motor Car Company, Oklahoma City.

Renault, Philippine Islands.—Paul Lacroix, general manager of the Renault Frères Selling Branch in America reports that a contract has been closed with Levy Brothers, of Manila, as representatives of Renault cars in the Philippine Islands.

Inter-State, Boston.—The Inter-State car will be hadled in Boston by the S. M. Supplies Company, which has recently organized an automobile department, with V. A. Charles as manager, and opened sales rooms at 22-24 Lincoln street.

Overland, Chicago.—A direct factory branch of the Overland Automobile Company is being operated at 1413 Michigan avenue, under the management of Charley Price.

PERSONAL TRADE MENTION.

Sigmund Krausz, who has been connected with the foreign department of the Dayton Motor Car Company, Dayton, O., has resigned after completing arrangements for Stoddard-Dayton agencies in South America, Cuba and Mexico. On the occasion of his departure from Dayton, O., Mr. Krausz was tendered a ferawell banquet, given by the Dayton company, C. G. Stoddard presiding at the function. Mr. Krausz is now looking for another foreign proposition, and can be addressed at 5607 Indiana avenue, Chicago, Ill.

Edward Cannon Bald was recently married in Pittsburg, Pa., to Mrs. Joan Seeley Gilbert, and the announcement reads that after February 15 his home address will be 5710 Baum street, in that city. Mr. Bald is remembered as the old bicycle champion, who held his kingship for several years. The news of his marriage will be read with considerable interest by his numerous friends throughout the entire country. He has automobile trade connections in Pittsburg.

John C. Wetmore, automobile editor of the New York *Evening Mail,* has gone South on a Winter vacation. John R. Eustis, a well-known automobile writer, and formerly in charge of the automobile department of the New York *Globe,* is this week looking after Mr. Wetmore's *Evening Mail* duties.

C. J. Connolly, for many years a well-known bicycle agent in Rochester, N. Y., and later on the traveling force of the Motor Car Equipment Company, has accepted a position with the Mutual Auto Accessories Company, of New York City, and will cover his old territory with a new line of automobile accessories.

"Wally Owen," one of the oldest and best known automobile men, has joined the staff of Fickling & Company, 304 and 306 West Forty-ninth street, and will hereafter take charge of the company's second-hand department, to be opened as a clearing house in New York City for the various automobile firms.

A. B. Cordner, senior member of the well-known New York City firm of Cordner, Flinn & Toppin, agents for the Acme, sailed for London recently. His purpose is to secure a much larger building there and move the London branch house into it. the business having outgrown the present quarters in that city.

P. C. Chrysler, formerly with the Rainier Motor Car Company, has been appointed manager of city sales for the American Locomotive Company at 1886 Broadway, New York City.

W. S. Gilbreath, formerly of the Pope-Waverley Company, will be a notable addition to the sales department of the Overland Automobile Company.

RECENT BUSINESS CHANGES.

McDowell Bros., Auburn, Ind.—Muncie gains one more manufacturing industry by the removal of McDowell Bros., who have been engaged in the manufacture of motor buggies here. A stock company has been organized and the business will be conducted on a much larger scale.

Cordner & Flinn, New York City.—The metropolitan agents for Acme cars announce that John L. Toppin has been admitted to the firm, whose cognomen will from now on be changed to Cordner, Flinn & Toppin.

Mitchell Automobile Company, Newark, N. J.—This concern, located at 282 Halsey street, has changed its name to the Crawford Automobile Company, and will handle the Crawford.

Mitchell, Cleveland.—The Cleveland agents for the Mitchell, Lucas & Christenson have removed to new quarters at 2139 East Eighteenth street.

Elmore, Cleveland.—The Elmore Motor Car Company will soon remove to its new home at Euclid avenue and East Ninth street.

BUSINESS TROUBLES.

Auto Motor Car Company, Cincinnati.—James H. Ratliff, vice-president, has asked for a receiver on the ground that the majority of stockholders have "fraudlently connived" to turn the assets over to the Sid Black Automobile Company by a "wash" sale. As a result, this $50,000 concern, he charges, is insolvent.

FRANKLIN ANNUAL MEETING.

SYRACUSE, N. Y., Feb. 1.—The annual meeting of the stockholders of the H. H. Franklin Manufacturing Company was held Thursday last at the company's factory. H. H. Franklin was re-elected president; Giles H. Stilwell, vice-president, and F. A. Barton, secretary and treasurer. The following men were re-elected directors: H. H. Franklin, E. H. Dann, John Wilkinson, Giles H. Stilwell, A. T. Brown, W. C. Lipe and F. A. Barton. J. G. Barker and H. W. Chapin were named as inspectors of election for the next annual meeting.

For the first time the stockholders used the new directors' room in the new office building. The company has entirely completed its new building and every inch of the total floor space of 20,000 square feet is in use. The main office entrance is now in West Marcellus street, a few feet west of Geddes. The new office quarters are ornate, and there is now plenty of room, light, etc., for everybody, including officers, directors and the small army of clerks and stenographers required to care for the concern's big business.

The report of the president, given at this meeting, was filled with interesting data. The year of 1902 was the first twelvemonth for the manufacture by the company of motor cars, and in that time thirteen cars were turned out. Now there have been built in one year in excess of 6,000. The employes of the company number 1,600, representing thirty-three trades. With the extensions of the past year, and not counting warehouse space leased for storage purposes, though including the newly leased plant of the Syracuse Bicycle Company, the concern now commands 250,000 square feet of floor space.

During the present trade year sale of cars has been made for shipment to Australia, Russia, Canada, Mexico, Cuba, Porto Rico and Hawaii.

Vol XX New York—Thursday, February 11, 1909—Chicago No. 6

THE AUTOMOBILE

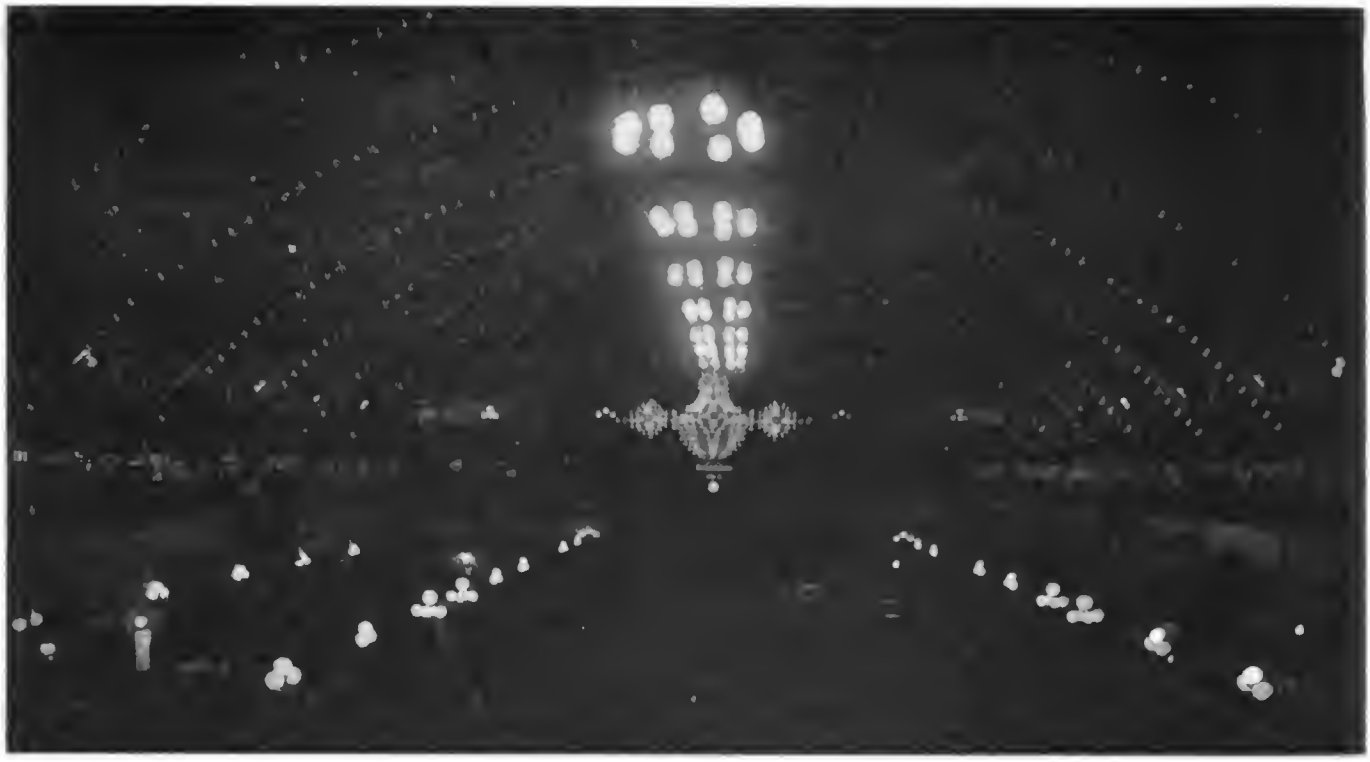
CHICAGO, Feb. 12.—Results are what count. The methods of the East are not always productive out this way, and Broadway isn't the only thoroughfare on which automobiles are displayed and sold. Furthermore, this show of the National Association of Automobile Manufacturers is artistically and completely the superior of either one of the two New York exhibitions, though, it must be said in the same breath that Manager Miles had plenty of material for the rolling of the two displays into a single affair. The job has been well done—most harmoniously accomplished—and the WEST (in capital letters) can truthfully boast that the agent and the individual buyer have an advantage over the East (only one capital) in making 1909 selections in one place instead of on two separate occasions.

There is confident feeling all around, out here, and the large out-of-town attendance figures largely in the premises, for there is undisputed railroad and hotel evidence that people have come many, many miles and from varied directions for the well defined purpose of buying automobiles of the present vintage.

For once, at least, real good weather favored the Saturday opening of the Chicago show. The temperature was above freezing, there was no wind, and the sun shone at intervals. Early visitors who went to the show at the hour of opening—2 o'clock in the afternoon—had a good chance to inspect the exhibits closely before the usual enormous night crowds flocked in after dinner. Eastern tradesmen, however, did not begin to arrive in any number until Monday morning.

To some the decorative scheme might appear to be getting too much attention. The exhibits of cars and chassis are somewhat overshadowed by the massive and elaborate decorations, with their variegated coloring. The view from one side to the other of the main hall is also cut off by the low papier-maché arches, molded and colored in imitation of cast bronze.

Notable absentees in the New York shows of this Winter who have prominent exhibits in the main hall are the Oldsmobile Company, Thomas B. Jeffery & Company, American Locomotive Company and the Bartholomew Company.



Above the "Blue" of the Car Displays the Decorative Scheme Proclaims Superiority.

There is no commercial vehicle section this year. The old Tattersalls building is unfit for use and badly located, and no other suitable building could be secured within reasonable distance. There are only three exclusive commercial vehicle exhibitors in the show—the Rapid Motor Vehicle Company, Grabowsky Power Wagon Company, and the Randolph Motor Car Company. The last two are located in the Coliseum Annex and the first in the Armory. Besides these, several pleasure car makers, particularly the motor buggy builders, are showing models of light gasoline delivery wagons.

The motorcycle section, which occupies all the central space on the second floor of the Annex, comprises nineteen different makes of machines, both American and foreign, and is the most comprehensive and best arranged exhibition of two-wheelers ever made in this country.

Closed cars for town use are in the decided minority, although Chicago uses many coupé and limousine machines. The prevailing models on display are touring cars, with folding tops, toy tonneaus, four-passenger bodies with a pair of bucket rear seats, and cross-country or high-powered runabout machines with rumble seat.

A dozen makers are showing high-wheeled machines, generally designated as motor buggies. Henceforth, however, the name will be a misnomer, for these machines are already undergoing a change in style. Several builders are fitting special runabout bodies with a third seat in the rear, bodies with true automobile hoods and other styles not borrowed from the carriage trade. In several cases engines are being located in front, sliding gear or planetary change-speed mechanism, differentials, etc., fitted, and other automobile features incorporated. Soon the chief resemblance these machines will bear to buggies will be in the high wheels and solid tires—and the wheels even are in some cases being reduced in diameter to 36 inches.

Were it not for the brilliant decorations, the show would present a somber aspect, for the prevailing finish of the machines is black, with perhaps a 25 per cent. proportion finished in maroon or other dull shades of red. Other colors used are generally of a quiet tone, such as dark green, brown, gray and white. Exceptions that prove the rule are several flaming scarlet machines and a violet-finished and upholstered electric coupé—a bridal model that attracts much attention.

The motor buggy has even acquired the distinction of a place of honor on the main floor of the Coliseum, as a recognition of this type as a permanent style of automobile. The Holsman—first and most consistent make—is found under the gallery against the north wall.

Miniature models of the engines used in their cars are displayed by the Maxwell-Briscoe Company and the Model Automobile Company, maker of the Great Western. These miniatures are only about a foot long, but are perfect working models, and the Great Western model is shown in operation driven by a small electric motor, the use of gasoline in the building being forbidden by the fire department.

The automobile show is a practical school of motoring, and hundreds of men and women—and probably more boys and young men—get a clearer idea of the actual operation of a gas engine and the change-speed and differential gears at the show than they can acquire in any other easy way. Several car exhibitors—as the Dayton Motor Car Company and the Chalmers-Detroit Motor Company—show full sized-sized motors sectioned down through the cylinders to show the action within the cylinders; others show the transmission in operation under a glass top to the gearcase, while parts makers show the steering gears and differentials in a manner to make the action plain.

The Berliet and Fiat are the only foreign cars in the show, and they are located in the Armory.

Here, as at the New York shows, the interest shown by visitors in the exhibits of component parts and accessories in the galleries is very pronounced, so much so that the narrow aisles high up under the steel trusses of the roof are quite inadequate. There is barely room in the aisles for two persons to pass each other under the arches and many a hat and some heads in passing have suffered from unexpected contact with structural steel.

Prize cups are prominent features of a number of the stands. The Vanderbilt silver cup at the Locomobile stand and the Savannah gold cup at the Fiat stand are the largest and most prominent, while the aggregation of cups and trophies won by the Pierce Arrow in endurance, economy, and hill climbing contests, and the collection of race prizes won by the Maxwell cars are attractive features of the Coliseum displays.

So inadequate to the present requirements of a national automobile show at the present time is the Coliseum that in addition

to the Renault, Ford, and P. & S. private displays outside, the Chadwick, American, and Velie are also excluded from the show through lack of space and are being displayed in private salesrooms: the Chadwick at 1218 Michigan avenue; the American at 1507 Michigan avenue, where the Petrel is also holding open house, and the Velie at the local branch of the Velie Motor Vehicle Company, of Moline, at 1615 Michigan avenue. The Palmer & Singer models are being exhibited for the first time in the West at the Auditorium Hotel on the main floor.

There have been numerous meetings and gatherings during the week. The branch managers and agents of various concerns have met and dined and talked and accomplished various things. The A. M. C. M. A. had its annual meeting; the A. A. A. Executive Committee is holding forth to-day; the makers and importers interested in racing have occupied much time in talking rules and race control; and all around there has been an automobile clearing house for the exchange of innumerable ideas and the discussion of matters requiring up-to-date attention.

SOLVING THE CONTEST SITUATION.

CHICAGO, Feb. 10.—There has been much talk about the control of contests, both racing and otherwise, in the past few days, and this is the way it is sized up on this Wednesday morning:

Beginning last Saturday there were sessions, one after another, of representatives of American concerns and foreign importers interested in contests and racing. The final result is a plan to have what will be termed a Manufacturers' Contest Association, membership on which will be limited to makers producing 50 cars annually and to importers handling 25 cars. This body will cooperate with the Contest Board of the A. A. A., providing the plan is acceptable this afternoon to the representatives of those manufacturers who have agreed to attend a meeting called for the purpose of considering the whole subject.

Next will come the offering of the more or less amended plan as it will be presented for ratification to-morrow to the executive committee of the A. A. A., which holds a monthly meeting.

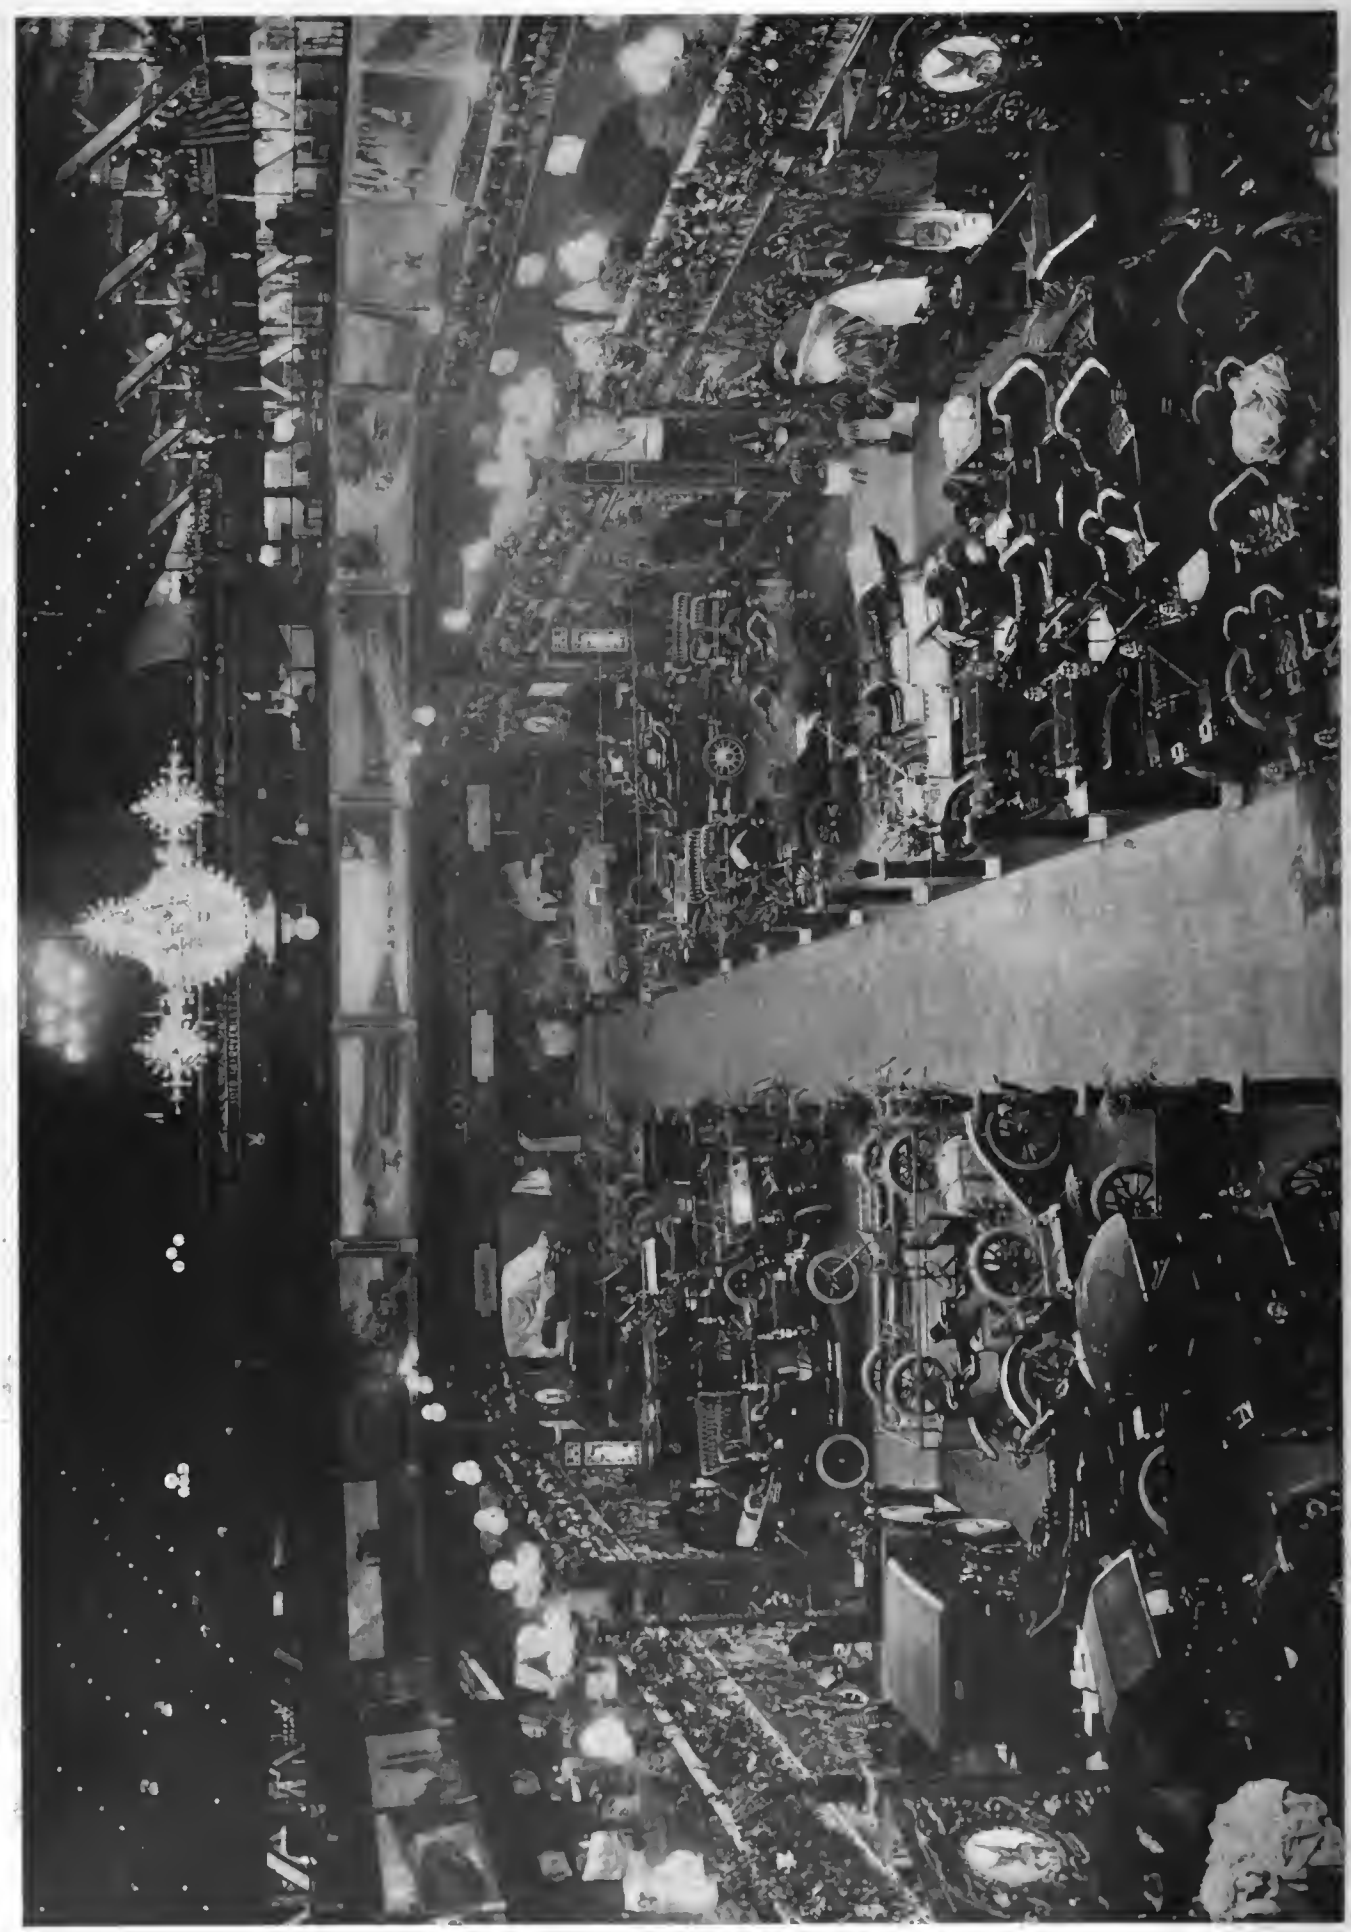
The N. A. A. M., the A. M. C. M. A., the A. L. A. M., and the importers will be represented on the Manufacturers' Contest Association, which would figure in the rule-making, granting of sanctions, etc. But the plan may be somewhat altered.

At the meeting which completed the preliminary work were the following: Howard E. Coffin (Chalmers-Detroit), H. O. Smith (Premier), William E. Metzger (E-M-F), Harry Lozier (Lozier), Paul La Croix (Renault), E. R. Hollander (Fiat), George H. Stroud (Apperson), Charles B. Shanks (Stearns), E. P. Chalfant (Association of Licensed Automobile Manufacturers), Alfred Reeves (American Motor Car Manufacturers' Association). A. R. Pardington and F. J. Wagner were also present upon invitation.

SMITH ELECTED PRESIDENT A. M. C. M. A.

CHICAGO, Feb. 10.—H. O. Smith, of the Premier Motor Mfg. Co., at the annual meeting of the American Motor Car Manufacturers' Association, was unanimously elected to the presidency, succeeding Benjamin Briscoe, who declined re-election after having served two terms. The other officers named were: C. G. Stoddard, Dayton Motor Car Company, vice-chairman; S. H. Mora, Mora Motor Car Company, treasurer; G. Vernon Rogers, Mitchell Motor Car Company, secretary, and W. H. Vandervoort, Moline Automobile Company, auditor. These three members of the committee management were re-elected: Charles M. Lewis, Jackson Automobile Company; W. C. Marmon, Nordyke & Marmon Company, and W. H. Vandervoort, Moline Automobile Company. Of course, Alfred Reeves, under whose capable management the association has progressed to a plenteous treasury and forty-two members, will continue as general manager. Both Mr. Briscoe and James Couzens, who was the first chairman of the committee management, will be remembered with souvenirs.

On the Coliseum's Main Floor a Galaxy of Splendid Automobiles Bask in the Milky Way of Lighting.



The Retina of the Camera Found Salient Features of the Landscape and Much to Picture Within the Coliseum's Ample Auditorium.

SOMETHING ABOUT THE NEW COMERS

A TOUR of the stands in the Chicago show reveals, besides a few newcomers with interesting exhibits, a fair variety of innovations and departures on the part of long-established concerns. On the whole, however, the seeker for extreme novelty is certain to be disappointed, unless his technical knowledge is so thorough that his interest finds satisfaction in the contemplation of the details and finer points of automobile engineering which escapes the average lay visitor's attention. Those of the old-timers among the motor-wise will seek with perhaps just a shade of regret for the work of the once perennial freak designer, whose vagaries afforded a certain entertainment even while they were a subject for derision. The automobile "game," which once supplied a conglomeration of some of the most fearful and wonderful devices man ever devised, even while it also marked time for a now historic engineering development, is long since dead and in its place has come the automobile "industry," which in its settled conservatism and substantial standing is second to none of the great fields of mankind's business and technical activities. Among those who did not exhibit at either of the New York shows are the following:

American Locomotive Company, New York and Chicago, continues to improve on its home-designed product to the extent of far outdistancing the excellent reputation it originally gained by its domestic duplication of a well-known foreign machine. The 1909 "Alco," as the car is now called, is built from stem to stern with the constant idea of making good on the manufacturer's slogan, "It stays new." The cylinders are of imported cast-iron, having a vanadium content, and are said to excel over those of ordinary product in that pitting never occurs in the course of wear, while a polish impossible to other irons is attained through use. Integral cams, make-and-break ignition with Bosch magneto, the extensive use alloy steels and imported bearings, four-speeds, and close engineering attention to detail and finish, are among the hallmarks of high quality that stand forth. The line includes a six-cylinder, 60-horsepower chassis, chain driven; a chain-driven, four-cylinder, 40-horsepower, and a shaft-driven 22-horsepower, with a variety of bodies.

Bartholomew Company, Peoria, Ill., is focusing its 1909 activities upon two models—a touring car and a roadster, both propelled by the same 45-horsepower engine, and containing substantially the same structural details, but differing in price. The rear-axle mounting of the change-speed gear in a unit with the differential housing is employed, with the usual selective operation affording three speeds forward and reverse. High-tension ignition, with magneto extra, is regular equipment. Unusually attractive are the body lines and the unusual harmony of the general design.

Dorris Motor Car Company, St. Louis, adheres to structural features justifying its claim to be called the "car of simplicity." With the radiator off, the camshaft with its bearings is readily removable through the front of the crankcase; with the flywheel and transmission out, the crankshaft comes out rearwardly in a similarly simple manner. The Dorris Company still adheres to its policy of building only one model of chassis—for touring, roadster, limousine, convertible, cab-landaulet, and other bodies. Besides simplicity, extreme accessibility is sought. Both exhaust and inlet valves are contained in removable cages, facilitating regrinding and maintenance. The cams are integral with the camshaft. The motor, clutch and change-speed gear are combined in the now popular unit power plant. The selective sliding-gear transmission affords three speeds forward and the reverse. Atwater-Kent ignition is stock equipment, but magneto is optional for those preferring it. A point is made of the liberal tire equipment, 34 x 4 being used all around.

Emancipator Auto Company, Aurora, Ill., is a newcomer in the low-price field, and is displaying a fully-equipped four-passenger car, with top, lamps, glass front, etc., propelled by a four-cylinder motor, driving by shaft through a two-speed planetary gear. The engine is a double horizontal opposed, an unusual construction,

Packard Chassis Is Reflected From a Mirror on the Floor.

National Cars as Jewels in a Sea of Relief Decorations.

possessed, however, of numerous features of merit. The crankcase, for example, is integral with the cylinders. Besides the touring car are a two-cylinder runabout and a delivery wagon on the runabout chassis. In this way the whole field is covered.

Thos. B. Jeffery & Company, Kenosha, Wis., are showing for 1909 a line that is a center of attraction, especially to the intending purchaser who seeks large, commodious cars of standard design at minimum prices. The Rambler spare wheel attracts especial attention, and the ease with which it can be interchanged, in four minutes, with one of the road wheels does not fail to appeal to the motor-wise who have struggled with roadside repairing of deflated tires. The offset crankshaft of the Rambler motors, placing the connecting rods in most effective position to receive the force of the expanding gases, is another point on which great stress is laid. The large openings to the crankcase, readily permitting connecting-rod adjustment from above, take the eye of those who worship at the shrine of accessibility. Another detail in which Rambler cars excell is the running gear, the spring being particularly ample and well designed to afford comfort and avoid breakage.

Meteor Motor Car Company, Davenport, Ia., is making only one model for 1909—a 50-horsepower, four-cylinder machine, with seven-passenger touring-car body. The change-speed gear departs from standard practice in that the gears are always in mesh, operative pairs being engaged by jaw-clutch systems similar to the external and internal gear meshing whereby the direct drive on high speed is obtained in common types of sliding gears. Final drive is by shaft, to a Timken live rear axle. The Bosch magneto constitutes a part of the ignition system,. storage battery being used as auxiliary.

Model Automobile Company, Peru, Ind., is appearing as Western distributers of the Great Western car, which is made in three four-cylinder models, all of standard outline. High-grade construction rather than innovations seems to be the policy behind the design of this machine, so aside from the use of exhaust valves in the cylinder heads and a few other slightly uncommon details, the construction is conservative. Interchangeability of parts is a point that will appeal to the user away from the large centers of population. The leader of the line is a 50-horsepower touring car, from which sizes taper down through the 40-horsepower touring car and the 30-horsepower touring car to a smaller runabout in the process of covering the field.

Olds Motor Works, Lansing, Mich., present an especially striking array of body designs for the prospective customer to choose from. Coupés, limousines, landaulets, regulation touring cars, toy tonneaus, roadsters and "close-coupled" designs, all are regularly catalogued for application to

the several chassis. Magneto ignition, valve-noise silencers, improved circulating pumps, completely protected driving mechanism, and a new live axle design are among the changes in mechanical details.

Owen-Thomas Motor Car Company, Janesville, Wis., is on view with a car fairly bristling with original features. It is a large six-cylinder machine, built with runabout, double roadster and seven-passenger touring bodies, and propelled by a four-cycle engine developing about 50 horsepower. This engine is internally air-cooled by scavenging blasts of air at different points in the cycle, and therefore functions without the use of any cooling ribs or fins whatever. Fuel is supplied by direct injection into the cylinders, and the valves are of an ingenious rotary type. The whole design is particularly interesting in that it would appear to constitute the first public embodiment in metal of ideas originally suggested by Victor Loughead in a series of articles an "Some Trends of Modern Automobile Design," which appeared in *Motor Age* during the Summer of 1907. An ironbound five-year replacement guarantee is evidence of the faith the manufacturers have in the new construction.

Rider-Lewis Motor Car Company, Muncie, Ind., is one of the few concerns that are specializing in the increasingly popular six-cylinder type, their only model being a 40-horsepower chassis, built with touring car, landaulet, limousine and roadster bodies. Simplicity of construction and light weight secured through the elimination of all surplus metal are the keynotes of the Rider-Lewis idea. Accessibility, too, has been given studied attention. Valve cages, for instance, remove upon the mere loosening of a locking ring. The crankshaft is assembled endwise into the one-piece crankcase. The clutch and clutch mechanism are directly under the footboards to facilitate inspection and adjustment. The change-speed gear is mounted on the rear axle. On the whole the cars of this make belong to the class in which accessibility is booked for first place and this fact coupled with a certain harmony of relation of power to weight renders the cars of more than passing interest. Public interest backs up the judgment of the designers.

Streator Motor Car Company, Streator, Ill., is for 1909 departing from its three seasons' old policy of making but one model, and now presents a considerable variety of cars built on two different chasses. An exhaustive search of the mechanism of both types fails to disclose a single radical detail, but it equally fails to disclose anything not of the soundest and most substantial engineering. The engines are four-cylinder in both chasses, 35-40 horsepower in one and 24 horsepower in the other. In the small car the change gear is built into the rear-axle housing. In the large it is of the standard three-speed selective type, with the usual placing.

HIGH-WHEELERS IN EVIDENCE.

Ancestors of all automobiles; neglected for a time; these same cars are now regarded as the fitting conclusion from the point of view of cars in which solid tires are at home, and in which stability resides to a marked extent, especially if road conditions are of the order "un-improved," as they are in many sections of the country. But if the cars of high-wheels will make headway under a handicap of roads, it is plain to be seen that on good roads autoists would have nothing to fear.

That the resilliency of high wheels will render solid tires capable has been adequately demonstrated, and that the high-wheel automobile is the favorite of the doctor and the contractor is but fitting proof of the wisdom of the automobile designers who declined to float with the tide which set up on pneumatic tires and rolled along on boulevards. The low price of the high-wheeler renders it the more fitting, and that it has a place in the art is as certain as the industry itself.

The Clark-Hatfield Auto Company, Oshkosh, Wis., make an exceptionally high-grade buggy type vehicle in one model only, sold at a price allowing the finest construction and workmanship. With a two-cylinder, air-cooled 14-horsepower motor, and a weight of only 1,200 pounds, its ability to go "anywhere a horse will go, and then some," will not be successfully disputed. A single-chain drive with ratchet differential constitutes something of a novelty.

The Columbus Buggy Company, Columbus, O., makers of high-wheel delivery wagons and buggies of several seasons' standing, are including in their line for 1909 a more conventional 35-horsepower touring car with pneumatic tires and other approved details, which they name the Firestone-Columbus. They also continue their excellent pneumatic-tired electric coupés, surreys, runabouts, victorias, phaetons.

The W. H. McIntyre Company, South Bend, Ind., is in the field with nine different models of high-wheeled machines. This concerns succeeds the W. H. Kiblinger Company, and is putting up some of the most convincing arguments, both in advertising and in product, that have yet appeared in favor of the advancing big wheeler.

The Mier Carriage and Buggy Company, Ligonier, Ind., puts out two models, both driven by side chains and both fitted with water-cooled, two-cylinder motors of types more nearly resembling standard automobile than high-wheeler practise. One of the engines is horizontal opposed and the other is a twin-cylinder vertical.

The Staver Carriage Company, Chicago, is showing the most powerful buggy-type machine ever exhibited—a four-cylinder, 22-horsepower machine, with 38-inch wheels and a 98-inch wheel-base. The engine is of the four-cylinder type.

CULLED FROM THE ACCESSORY DIVISION

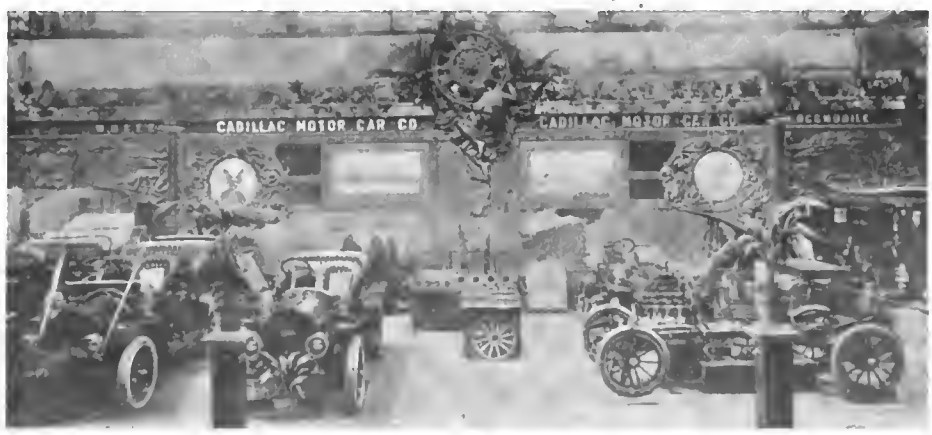
THAT the city by Lake Michigan can boast a Western trade exclusively and inalienably its own, is well demonstrated in the number and importance of the exhibitors who did not display their wares at either of the New York shows. Indeed, no one closely identified with the interests of the trade could afford to be unfamiliar with the novelties to be seen at some of the stands.

Bower Roller Bearing Company, Dayton, O., is a newcomer in the bearing field, but the product of this concern's activities bears every evidence of having attained a quality possible only as the result of high designing ability and prolonged experimental investigation. All of the Bower bearings are of the non-adjustable (except for end thrust) annular type, with the load carried on cylindrical rollers, which are provided, however, with enlarged heads that come into play only to resist end thrust. A special steel alloy containing a percentage of nickel and of extreme hardness and resisting qualities has been developed for this company's use. Finishing is accomplished under water in special grinding machines, and no part passes inspection until it tests to the most extreme accuracy of size and fit. Considerable of a departure in roller bearing manufacture is the production of a line of metric sizes designed to interchange with standard annular ball bearings. Another innovation is a policy of designing to the user's requiments instead of requiring him to use listed sizes.

Firestone Tire & Rubber Co., Akron, Ohio, is showing for the first time its new demountable rim for the side-wire solid tires. Extreme simplicity is the great point of this rim, a locking ring serving to let the tire off in case of its injury, so that it may be as quickly replaced with a new one carried on a similar rim. The Firestone demountable rim for pneumatic tires is made to be used in conjunction with either clincher or quick-detachable tires, and is very similar to the type just described, except for the absence of the side flange. It was this rim with Firestone tires on which the Locomobile won the Fairmount Park race in Philadelphia last October. One advantage is that it permits the use of regular inner tubes, without special valves.

Fulton & Zinke, Chicago, are exhibiting circulating pumps, coils, lamps, generators, carbureters, make-and-break spark plugs, the Churchhill timer, an exceptionally practical looking air cranking device, etc. The cranking device consists essentially of two semi-circular cylinders, containing sinble acting pistons arranged to be driven to the end of their travel by air from a tire bottle or other suitable source, controlled by a simple four-way valve that can be manipulaed from the dash. One of the cylinders is much larger than the other, and upon it devolves the work of throwing the crankshaft over 180 degrees at a time. The smaller piston retracts the larger, so that the half revolutions can be effected rapidly and repeatedly until the engine starts. The price is not high, attachment is simple, and the field would appear to be wide open for anything apparently so well adapted to do the work. The novel point of the Churchhill timer is provision for adjusting the contact duration to meet the needs of different engines, a feature for which there undoubtedly is some need.

Hancock Mfg. Co., Charlotte, Mich., long recognized as one of the best multi-feed lubricators on the market, the 1909 models are in every way calculated to uphold their established good reputation. Improvements, however, are confined to details rather than extended to general principles, and simplicity of construction and positiveness of operation are ideals which the technically informed will be especially disposed to approve. A new compound tire pump is a side product of the Hancock Company, it being designed to overcome objections existing in types previously in use. By scheming to reduce friction and valve losses to a minimum, it is declared that a greater volume of air can be pumped to a given pressure with less effort than is required for the operation of any other pump made. Moreover, special thought has been devoted to the working out of such details as will insure its remaining in order for the greatest possible period without adjustment, cleaning or repair. This is fortunate since lack of stability and good design is bound to make for more than a little dissatisfaction in this zone of activity.



Cadillac with Individual, Copper-Jacketed Cylinders.

Toledo Chassis in Which Chrome Nickel Steel Abounds.

First Regiment Armory, Where Photographing Was Most Difficult and Unsatisfactory.

Another General View in the First Regiment Armory From a Somewhat Different Angle.

Imperial Brass Mfg. Co., Chicago, is demonstrating at its stand a new compression coupling for gasoline and oil lines which is of unprecedented simplicity and security. Each normal coupling consists of five parts—a central member, two tapered sleeves and two nuts. The central part is counterbored to receive the pipe ends, and the nuts, each of which contains one of the sleeves, are placed on the pipes before they are entered into the center part. Then, by screwing the nuts up, the tapered members wedge into the pipe in such a manner as to form in it an annular constriction, very slight, but ample to prevent separation and leakage. Besides in the form of plain couplings this connection is regularly furnished in the forms of elbows, tees, check valves, etc., in at least five different sizes. The manufacture of many other small articles in the way of turned and stamped brasswork and the like is the business of this concern, and the display at the stand of many such articles that have been made to customer's orders is most informing.

Long Mfg. Co., Chicago, though the originators of the much-used helically finned radiator tube, has added to its product conventional lines of flat tubes and cellular radiators. These latter are said to be the only ones made that can be repaired with ordinary soldering facilities. An interesting feature of this company's product is the great capacity of some of the truck and rail motor-car radiators it has turned out. A unique distinction enjoyed by its ingenious "spiral-tube" construction has been its use for years in the condensers of the White steam cars, in which the requirements are in some respects materially more severe than in ordinary radiators for gasoline engine cooling. The tables of sizes, capacities, cooling areas, etc., which occupy considerable space in the Long catalogue is a bit of engineering enterprise, the imitation of which is to be commended to competitors. In addition to radiators, hoods and sheet-metal fenders are made by this concern.

Pfanstiehl Electrical Laboratory North Chicago, offers a "fool-proof" vibrator as one of the talking points of this year's Pfanstiehl coils, and if any about a car needs to be fool-proof it certainly will be admitted that this much abused detail is a foremost candidate. By designing for extreme high speed of the trembler blade, by eliminating movement of the platinum-iridium contact points as a means of adjustment, and by unprecedentedly close relation of condenser capacity, it is made impossible even by the most reckless tinkering to make the current consumption fall lower than 1-4 ampere or rise above 1 1-4 amperes on closed circuit—equivalent, of course, to much less when the engine is running. An improved lock switch is fitted to each coil box, in which the coils are assembled on the popular unit system. Non-vibrator, marine and motorcycle coils are also manufactured.

Universal Tire Protector Company, Angola, Ind., presents some of the most interesting of the Western devices in the way of ingenious and original solutions of the tire problem. Most radical is its emergency tire sleeve—in a way similar to the old blowout manchons—but it is made of metal-studded chrome leather and provided with a decided novelty in the form of a positive and adjustable mechanical anchorage, constituted of a pair of sheet-metal boxes containing double ratchet devices whereby the straps that hold the sleeve in place can be drawn to any desired tightness. Steel side bars distribute the pull along the sides of the sleeve. Advantages over laced-on sleeves, drawn tight only by subsequent inflation of the tire, are apparent. Moreover, new sleeves can be fitted to the anchorage at lower costs than prevail with laced-on types. Besides their blowout sleeves, this company is in the field with a new metal-studded tire protector, differing from others of its kind chiefly in the provision of mechanical anchorage. By applying it to deflated tire, drawing it up as tightly as possible by the ratchet-edge bands and then inflating the tire, a degree of tension not realizable by the more common method of inflation alone is attained, with consequent laying of the chief bugbear of similar devices—their tendency to work and creep on the tire.

Twentieth Century Motor Car Co., South Bend, Ind., makers of Williams' divided wind shields, are showing a thoroughly standardized product, capable of application to any type of car, and of somewhat unusual merit in that it can be set in three different positions — "down," "straight up" and "forward." The down positions is with the upper half of the glass slightly lowered and to the rear of its normal place on top of the lower half, in which condition it permits raising or lowering of a cape hood. Nor does its manipulation require the dismounting of the side lamps. The so-called forward position is a new one, in which both parts of the glass are inclined, the upper slightly ahead of the lower and with an open space between. This gives ventilation, yet prevents the entry of bugs, dust and rain. The straight-up is, of course, the normal position. When the shield is not desired, it can be folded completely down to a horizontal position forward from the dashboard.

Triple Action Spring Company, Chicago, whose helical springs, in conjunction with scroll attachments have been a standby for several years past, are more added to in styles than changed in principle in this year's product. One new detail, however, is the use of a link in a very ingenious way for the purpose of stopping side motion. It seems well established that springs of this character, properly applied in connection with the stock-plate springs of a car, and correctly proportioned to the work that will devolve upon them, exercise a most marked effect in reducing spring breakage and conducing to ease of riding.

Vivax Storage Battery Company, Chicago, is convincing many of the merits of its excellent line. A feature of the Vivax batteries is the grids and plates, which is of a design exclusive with this concern, and which is so formed as to reduce to a minimum the common tendency for the active material to work out and cause short-circuiting, loss of capacity, etc. Another point upon which stress is laid is the reinforcement of the jars, which are specially strengthened at points most subject to strain. Unusual ingenuity has been expended in working out the details of venting and sealing, and as a final protection against leakage and injury every battery is sold in a paraffine-proofed oak case. Every size up to the 8-volt, 60-ampere hour type is made. Also, an important part of the business is the supplying of any and every combination of cells that can be used in the propulsion of electric vehicles. Another specialty is a novel rheostat charging set. On the whole the "Vivax" stands for real improvement in storage battery work in divers ways, amongst which will be noticed the ease with which the battery can be maintained, and the fact that it is not prone to fail in service, or become difficult to charge, when, in the course of events charging becomes necessary.

GENERAL GOSSIP OF THE BIG SHOW

Gladiators Attracted the Throngs.—At the Locomobile stand the Vanderbilt Cup winner and the trophy itself proved a pair that commanded attention, while at the Thomas exhibit the interest was no less pronounced in the "Round-the-World" car which put it all over the foreigners in that spectacular event.

Manager Miles Lucky to Have Fest.—A cold that settled in his throat put Manager S. A. Miles more or less out of the running before and during the early part of show week, and as a sequence L. L. Fest, the assistant manager, had to be at the exhibition helm much of the time. As one man remarked, "Miles was lucky to have Fest on the job," for the assistant met the requirements most adequately. At times it required fast going.

Racing Still Attracts.—There is no doubt whatever as to a continued interest in high speed contests. A. R. Pardington of the Long Island Motor Parkway was in evidence in the early part of the show before he went to Mount Clemens for a bit of rest, and the many inquiries aimed at him told a story of this desire by not a few to have some big events in the metropolitan district. "Pardy" answered all queries successfully, and one hopes his optimism will become true in the early spring.

Where the Central Lateral Aisle Divides the Coliseum.

Woods Company's Good Smoker.—Wednesday night the Woods smoker and Dutch luncheon, at the new and completely equipped factory on Calumet avenue, helped to keep many a pleased show participant out of his bed until an early hour. The vaudeville was unusually good. The master of ceremonies was Carl Metzger, who is greatly responsible for the innumerable Woods electrics about the streets of Chicago.

Of Course Reeves Was There.—No matter when or where it may take place there will be always found at any notable automobile event the indomitable and ever-busy Alfred Reeves, whose success with the management of the A. M. C. M. A. is a story known to all automobiling. Mr. Reeves frankly admitted that the Chicago show had won the medal on decorations.

"Van" Selling the Knox.—One of the most visited stands was that of the Knox, the Chicago branch of which is now under the management of N. H. Van Sicklen, veteran of two industries, but until recently always in the publishing field. "Van" takes to the selling of cars as naturally as he did to looking after the business destinies of *Bearings* and later of *Motor Age*, which means that there will be many Knox cars in and about Chicago very soon.

Among Those Present.—The list was a long one of the notables of the industry. For instance, one trio would include "Joe" Tracy, widely known for past racing prowess; Otto Nestman, an early Stevens-Duryea performer and now with its Omaha agency; and "Teddy" Dey, the Pierce pilot of Glidden tour fame.

Maxwellites Have a Dinner.—As usual the Maxwell-Briscoe Company entertained its agents at the show with a dinner, this taking place to-night at the Auditorium. Many were present from some distance.

Route of the Glidden Tour.—This is a question that cannot be answered at present. Chairman F. B. Hower is besieged with delegations and letters. One idea that is finding favor is Chicago to Milwaukee, to Minneapolis-St. Paul, and to Denver, with a return taking in Kansas City, St. Louis, and Indianapolis. There is much sentiment for a start in Detroit. Whatever the route, there will be heartburnings.

Annual of Chicago's Trade Association.—As a sort of a preliminary to the Chicago show, the Chicago Automobile Trade Association held its third annual banquet Friday night at the Chicago Automobile Club, which was attended by 60 tradesmen, within 10 of the full membership of the association. It wasn't all trade talk at the dinner, though among the speakers being Ira M. Cobe, president of the Chicago Automobile Club; John Farson, ex-president of the Chicago Automobile Club, and Alderman Milton J. Foreman, who also is an enthusiastic autoist. The tradesmen were represented in the talkfest by Thomas J.

Where the Accessory Exhibits Were Located in the Coliseum Mid Flag-Draped Galleries.

Hay, the Ford branch manager; Ralph Temple, the Jackson agent; Charles E. Gregory, representing the taxicab interests, and Joseph F. Gunther, of the Apperson agency. Walter Githens, president of the trade association, was toastmaster. The affair was given added importance by the announcement of Mr. Cobe of his tender to the A. A. A. of a trophy for the national stock chassis race. Alderman Foreman made a witty speech, in which he declared the motor car was revolutionizing the world and told how strong it was with the city administration. Speaking of road racing, he declared he was greatly interested in it; that he saw lots of road racing right on Michigan avenue.

Moline Farmer's Interchangeable.—The Moline Automobile Company, of East Moline, Ills., has designed and built a car particularly for the farmer. This is the new Moline Model H, which sells for $1,500. It has a road clearance of 14 inches, when equipped with a double side-chain drive, and has a detachable tonneau, making the rear deck available for carrying purposes when the seats are removed. "The farmers of the Middle West have not been slow to realize the value of such a car," says W. H. Vandervoort, sales-manager of the Moline Company, "and we are having a splendid success with the new Model H. For city use, we equip the same car with a shaft drive. 'The Automobile on the Farm' is the title of a booklet describing the machine in detail, which we have been sending out broadcast." In addition to its complete line at the Coliseum, the Moline Company will hold an overflow show at its Chicago salesrooms, 1220 Michigan avenue.

One of the Latest Franklin Ideas.—One interior-driven motor car is to be shown by the Franklin Company among its 1909 models. This is an 18-horsepower brougham, built upon the same chassis as the Franklin touring car of the same power. It is an adaptation of the doctor's closed carriage and is made to suit those people who insist upon the comfort and protection of a closed carriage and who yet want to do their own driving. It carries two people. The finish is in Franklin standard colors. The trimming of the interior is of goatskin with blue broad lace. The appointments are simple, as this class of motor car is made to specially meet the requirements of the business and profes-

Mural Decorations Waylaid the Eye Approaching the Galleries Where the Accessory Displays Were Massed.

sional man, and the need is for good service under hard usage. There is a small front extension of the top, affording protection when the car is being driven with the front window partly open, and this in addition protects the glass during severe storms. All the glass frames are made to either fold up or drop into grooves. These frames are of mahogany of natural finish. The mudguards are of the conventional long curved pattern. A rear guard is made with the wing on the inside to thoroughly protect the body. The use of an ample chassis permits provision at the rear for a good sized receptacle.

DETROIT AUTO SHOW OPENS NEXT WEEK.

DETROIT, Feb. 8.—Next Monday evening Detroit's "biggest little" automobile show will be thrown open to the public, and local enthusiasts will be given their first opportunity to inspect all the new models under one roof. The members of the Detroit Automobile Dealers' Association, who organized the show, say that the time-honored term "biggest little" no longer expresses the situation accurately. In proof that the show is not little, they assert that there will be upward of 200 cars on the two floors of the Wayne Casino, in addition to the latest in commercial vehicles and motorcycles.

The scheme of decorations includes the conversion of the lower floor into a Venetian garden, where hundreds of canaries will provide music, in addition to a large orchestra. More than a score of immense landscape paintings will form the background. The list of exhibitors follows:

Automobile Dealers.—American Electric Auto Co.; Anderson Carriage Co.; Ashley Pond, Jr.; J. H. Brady Auto Co.; Brush Runabout Co.; Buick Motor Co.; Cadillac Motor Car Co.; Cartercar Co., Pontiac, Mich.; Coombs & Gilmour; Everitt-Metzger-Flanders Co.; C. B. Fear Auto Co.; Ford Motor Co.; Grant Bros.; Hupp Motor Co.; W. G. Isbell; J. B. McIntosh; Maxwell-Briscoe-McLeod Co.; Wm. Neuman & Co.; Olds Motor Works; Postal & Doherty; Rapid Motor Vehicle Co., Pontiac, Mich.; Rumsey Electric Co.; J. P. Schneider; Seidler-Miner Automobile Co.; Seitz Auto & Transmission Co.; Standard Auto Co.; H. H. Thorpe; Winton Motor Carriage Co.

Accessory Dealers.—Auto Accessories Manufacturing Co.; Auto Equipment Co.; H. W. Brown; Gemmer Manufacturing Co.; General Sales Co.; Gleholt Machine Co., Madison, Wis.; H. W. Johns-Manville Co.; Fred Kicherer; Martin Meier & Co.; W. E. Metzger; Michigan Storage Battery Co.; Miller Storage Battery Co.; Modern Machinery and Engineering Co., Cleveland, Ohio; New Process Steel Co., Marshall, Mich.; Rochford Mfg. Co., Chicago, Ill.; J. B. Trossell; United States Spare Wheel Co.; Wm. E. Wandersee; Wayne Chemical Co.; Westinghouse Co.

MILWAUKEE SHOW MAKES PREPARATIONS.

MILWAUKEE, WIS., Feb. 8.—The first annual show of the Milwaukee Automobile Club will be held in the Hippodrome from March 11 to 13, and the club members are waxing very enthusiastic over the plans. Clarke S. Drake, president of the club, has been appointed general manager and is carrying the arrangements along at a pace that will insure results.

The main floor of the big building will be used for exhibits of cars and the galleries for accessories, parts and tires. Each exhibitor must show at least two cars or chasses for the space assigned him. Allotments will be made by drawing on February 15. The club will furnish all signs and decorations, to insure uniformity and a harmonious scheme.

MONTREAL CLUB TO HOLD AUTOMOBILE SHOW.

MONTREAL, CAN., Feb. 8.—Although it has generally been understood that there would be only one automobile show in Canada this year, and that in Toronto, the Automobile Club of Canada at its meeting last Saturday arranged to hold another show some time in April. It is considered that the date of the Toronto show is entirely too early. The club has also invited the mayors of the municipalities along the Lake Shore road to a meeting next Thursday, at which they will consider how to avoid any inconvenience from the use of automobiles on the driveway.

NEWARK SHOW IN THE FOREGROUND.

NEWARK, N. J., Feb. 8.—In view of the large list of the most representative companies who have signaled a willingness to render support to the enterprise, and in further view of the fact that every one in Newark is awakening to the fact that the industry is thoroughly represented there, it will come as no surprise to the well informed of the industry to learn that the entire available space has been assigned, barring room for a couple of cars and some accessories.

The undertaking is a big one, and in view of the fact that opening night is less than two weeks away, it is plain to be seen that a little "ginger" will have to be injected into the workers, a supply of which is bound to rest in the maw of the management, evidences of which are bound up in energy which is spilled lavishly in every direction savoring of good.

There will be so many "special nights" that the opening and closing nights may be the only regular sessions. At all events, the present outlook includes "Essex Troop" night, New Jersey Automobile and Motor Club night, etc., and enthusiasm runs high, particularly in view of the splendid display which is all that can happen in view of the list of exhibitors as they are here given.

INDIANAPOLIS DEALERS' WEEK, MARCH 22-28.

INDIANAPOLIS, IND., Feb. 8.—Plans for the largest celebration automobile men have ever had in the city are being arranged by the Automobile Club of Indiana. The Indianapolis Automobile Trade Association, under whose auspices such affairs were formerly conducted, was recently consolidated with the club.

An opening week will be observed from March 22-28, and during the week a number of interesting events will take place. These will include a parade on the opening day of the week, in which owners, dealers and manufacturers will participate. On following days will be given a banquet, endurance contests, novelty races and a hill climb.

Throughout the week each dealer will exhibit 1909 models in his own establishment, and the show rooms will be attractively decorated. The committee making arrangements for the week is composed of F. I. Willis, of the Hearsey-Willis Company; Frank Moore, of the Fisher Automobile Company; B. W. Twyman, of the Motor Car Sales Company; D. B. Sullivan, of the Sullivan Automobile Company, and Cecil E. Gibson, of the Gibson Automobile Company.

TECHNICAL ADVANTAGES OF UNDERSLUNG CHASSIS

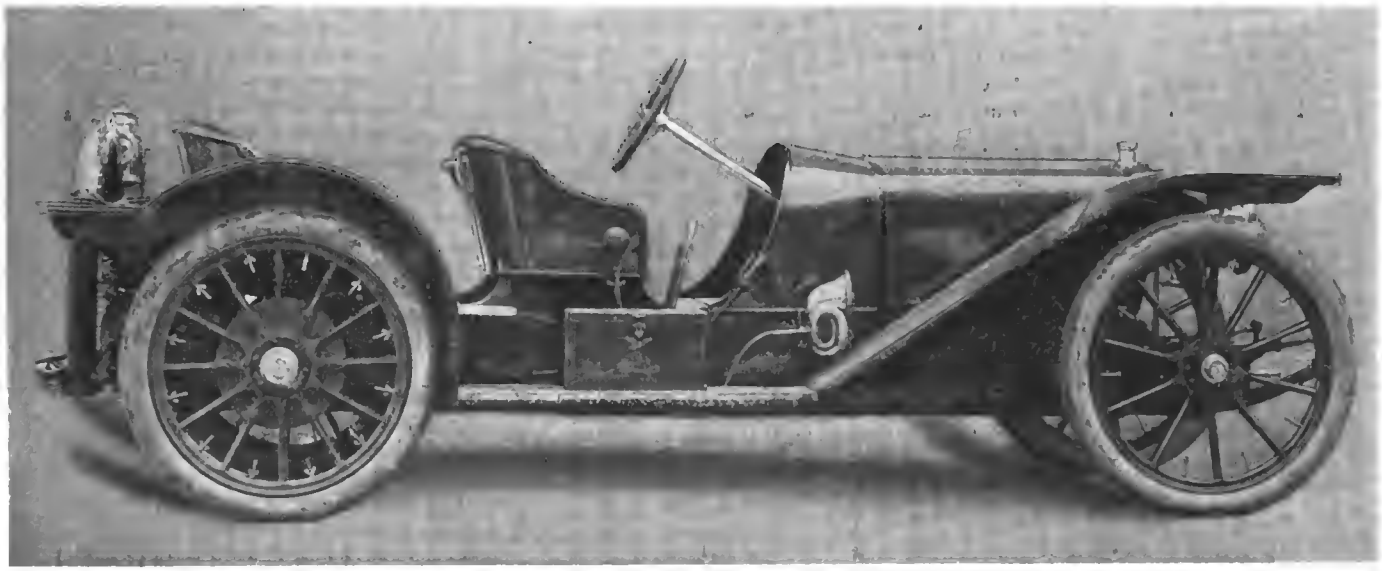
By CHAS. E. DURYEA, Technical Expert, A. M. C. M. A.

ONE of the "stylish" features of the earlier types of autos was the high position of the body and riders, but as the purchasers became better acquainted with the speeds possible by the new vehicle, they saw the advantage of low center of gravity, and makers have been each year catering more and more to the demand for low-built rigs. The ability of the vehicle and the comfort of the passengers are both increased in many respects by low mounting, although, of course, some other desirable features are lost. The low vehicle is safer and less likely to overturn as the result of a skid or in case of running into a ditch, curb., etc. It offers less wind resistance and so is more pleasant to ride in at speed. On roads that are not perfect the side swaying is less because of the lessened radius, which adds very materially to the comfort of the passengers. The strains on the wheels in turning or on sloping roads are less. Mounting and dismounting are handier and easier. With no horse in front and continuous guards from one end to the other and one side to the opposite, there is no need to sit high to escape the mud and other undesirable things found near the ground. With high speed there is no need to take the other fellow's dust very long, so even this reason for sitting high is absent. The ability to see is less and the appearance is not so impressive, but these decidedly horsey features are small loss compared with the many gains.

Low Center of Gravity Desirable.—For years low center of gravity with these advantages has been advocated by leaders, but makers found it difficult to comply fully. The complicated mechanism of the past required all the room available under the floor of the vehicle, and it seemed easier to mount the passengers high than to adapt the motors to the proferred low body arrangement. With the moving of the motors to the front the one great obstacle has been eliminated and the conventional auto now has its floor but little above the crankshaft level of the motor. The steady increase in wheel sizes had its effect also, for axles must have room to rise, and until the foreign makers set the pace American makers were many against changes of frame which would permit low carrying of the passengers and also large wheels.

Merit, being immortal, finally won, and to-day we find practically all makers of the larger and speedier vehicles using 36-inch wheels, while some like the Gaeth and the American Traveler have wheels as large as 38 and 40 inches. To permit this practice a great number of the frames of the chasses are dropped or curved, so as to be low between the wheels while rising high over the rear axle or from in front of the rear axle to the full rear. This type of frame is found on the American Simplex, the Midland, the Marmon, the Mora, the Moon, the National, the Pennsylvania, the Regal, the Pullman and the Welch cars in some or all of their models.

Natural Advantages of the Underslung Frame.—On the American cars the problem is worked out to the fullest by carrying the frame under the axles and springs, producing what is undoubtedly the lowest center of gravity vehicle in the automobile trade. There is, of course, no mechanical reason against such hanging, and the spring action cannot be other than excellent. The added comfort and safety at speed must be very evident and the style of the workmanship as well as the originality of design make this departure well worthy of study. As the needs of the various types of buyers become better known to the makers and to the buyers themselves, special features securing valuable results not secured by the average type of construction will become more common, and makers will gain for themselves a class of followers by this specialization that will take their product without the necessity of keen competition, as must result if the market for average goods is overfilled.



American Roadster, Showing the Underslung Frame Construction with Wheel Diameters for Adequate Road Clearance.

Not only are autos designed with fewer parts, but the parts are better protected from the mud and dust, so the low-hung chassis is not objectionable, while as roads become better each year the necessity for clearance is becoming less. Racing autos have long been built on these lines and the builders who copy them are but following the lessons taught on the track and course.

AERONAUTICAL NOTES FROM GERMANY.

Berlin, Feb. 1.—Two new German airships are rapidly nearing completion, the one being the work of the celebrated Duerkopp firm and fitted with two motors, while the other is being built by the well-known engineer, Dr. Huth, on the three-decker principle. Trials will be made with both early in the Spring.

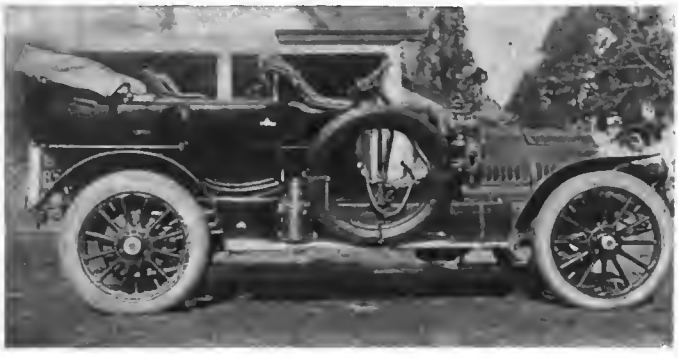
The vicinity of Zurich will be the start of the next Aero Gordon Bennett event, which the Swiss Aero Club now has to arrange. Entries for the race, which will take place about the end of September, close on March 15.

CONCLUSIVE EVIDENCE OF AUTOMOBILE ECONOMY

29,000 miles at a cost of $90 is the upkeep record of one automobile and it is probably one of the most interesting facts which ever come to the surface. In view of the fact that the earlier records of cost of maintenance were sometimes quite high, and in further view of the proneness of men to mention the things which impress them most, it generally happens that the cars which went about their business failed to receive mention, while the cars which run up a repair bill were mentioned in song and story time and again.

When an authentic record such as this is open to inspection then it belongs to the class of incidents which entitles it to space—nay, preferred space, which in a newspaper is reserved for the matters that compel respect. In this case W. L. Lewis pleaded guilty to having engaged a good chauffeur for his Thomas car—a regular stock four-cylinder sixty—and that he would know something about the cost of maintenance it was his custom to "count the cost." That the chauffeur, A. Douglass, did influence the situation in favor of good performance merely goes to show that the cost of a good chauffeur is by way of insurance of the character which weighs heavily in favor.

Twelve Thousand Miles Piled Up the First Season.—In the year 1907 the car was put into commission and the mileage as above given made bold to proclaim the qualities of the car,



W. L. Lewis's 60-H.P. Thomas Always Ready to Run.

especially in view of the fact that each additional day lent confidence, and of service interruptions there was none, while the cost, as it was computed at the end of the season's service went to cover "precautions" to a large extent, although it is true that prudence dictated that the motor bearings be adjusted for slight wear, then it was desired to retain the noiseless performance of the car which was done at the expense of a new set of sprockets; moreover, in going over the car very carefully it was considered that the front wheel bearings were slack and replaced.

With the season over, the chauffeur went over the car with the care born of much skill and a desire to distinguish himself from the class of men who pretend to be competent, but who fail to make good, with the result that the motor was carefully overhauled, the cylinders were cleaned out, valves ground to a tight seat, oiling system overhauled, piping gone over, etc., thus rendering the motor as "sweet" running as the day it came from the maker. Likewise, the clutch was treated, not that it absolutely required attention, but the chauffeur went into the matter in a way to prove that it really does pay to have a good man, even at the cost. With the transmission up to a fitting standard, the car as a whole as clean as a whistle, the first year of service footed, in point of cost, up to the following:

SUMMARY OF FIRST YEAR'S COST OF REPAIRS.

New set of sprockets	$30
Front wheel roller bearings	10
Total	$40

Considering the fact that the first year's service was largely in the winter time (the winter of 1908), it will be rendered quite plain that the cost was very low, indeed, and it was expected that something by way of an increase would be rendered manifest within the distance of travel of a few thousand miles when the car was put back to work in the Summer of 1908.

Seventeen Thousand Miles Was Made the Second Season.—Despite the arduous service of the first year the car exhibited rare touring qualities during the last year, in which the mileage exceeded the first year by 5,000 miles, and at the close of the season it was decided to give the car the benefit of a good overhauling, which the chauffeur undertook and carried it to a successful termination. The same man did all the work from the start, and it is interesting to note that in making repairs, while he did replace parts much the worse for wear, the fact remains that he made adjustments rather than replacements in nine cases out of ten, thus showing that it is not necessary to go to great expense in many cases, if only the chauffeur is competent.

With an idea of showing the extent of the service it will be pointed out that the brake drums on the rear road wheels had to be turned down (trued up), because of the amount of work the brakes were suffered to do in the 29,000 miles travel. Before going farther it will be as well to say that this same arduous service resulted in the breakage of one spring (front), which was replaced at the time. At the end of the second year, as the result of careful inspection, it was decided to replace parts as follows:

One set of roller bearings for the steering gear in order to do away with some lost motion, which is so undesirable, even if slight, as to warrant the cost of doing away with it.

One set of camshaft bearings in order to bring the motor up to the sweet running condition which obtained at the start.

One pump gear, which was considered below a fitting standard, but not of necessity gone.

All the replacements of the second season run into costs as follows:

SUMMARY OF THE SECOND YEAR'S COST OF REPAIRS.

Front spring	$18
Roller bearings, camshaft bearings and pump gear	30
Extra spring clips	2
Total	$50

RECAPITULATION OF ALL COSTS FOR 29,000 MILES.

Paid out during first year	$40
Paid out during second year	50
Paid out total	$90

It will be observed that the whole performance showed that the car did not get into serious trouble at any time, and it is true as well that the repairs made could be far more expensive in the absence of a man who saved the situation. The incidental costs of running the car were very fair, indeed, in that besides $0.0031 per mile, cost of repairs, the gasoline bill was on a basis of 11 to 12 miles per gallon, while the lubricating oil bill footed up on a basis of 150 to 160 miles per gallon. On a few occasions the lubricating bill fell off to 200 miles per gallon, but the average was as above given.

The question of the tires is one which will have to be dealt with in a general way, but it is fair to say that the front tires run fully 5,000 miles, while the rear tires lasted for 4,000 miles at least. The rear tires were made to do additional duty by retreading, and the tire repairs were well attended to in the main. On the whole, it is fair to say that much of the good performance was due to the fact that "a stitch in time saves nine" and the chauffeur was alive to the fact.

As a fair indication of the system used in connection with the up-keep of the car it is only necessary to relate that the connecting rods were examined and taken up, if necessary, every 5,000 miles, while the valves were ground in every 6,000 miles, and the brakebands received attention every 7,000 miles, and so on. There was a set time for the performance of each of the duties, and while it was not always necessary to do work, it was considered desirable to examine into the condition which obtained and by so doing ascertain if aught was awry.

TREND IN TRANSMISSION PRACTICE

By Thos. J. Fay. Chapter II

UNDER the circumstances, if carbon steel is to be used of grades higher in carbon than the composition which will admit of case-hardening, the carbon must be high enough to engender the requisite surface hardness as the result of quenching and tempering, in the absence of the carbonizing process. That the carbon must be much above the point as above given for cementing steel is assured, an illustration of which was given.

Without going into the question of the results due to further heat treatment, at this time, it is to point out that the safe limit for carbon content is fairly represented in the range given, and if the steel as shown in the test is in the best state to which is can be reduced, from the point of view of "normal steel," or if there is a certain uniformity of degrees of superiority, then it is plain that the difference as between carbon low enough to allow of "cementation" and the highest carbon content recorded above does not afford a sufficient difference to render it clear that any other mode of heat treatment will suffice for the purpose, considering carbon steel.

By cementing (in a suitable manner) the steel of the lower carbon, including the specimens, numbers 1 and 2 would be of such strength as to serve for gears, whereas none of the products given would develop strength up to the requirements as the result of any other form of heat treatment. On the other hand, with the carbon content above that given in specimen number 2, a crystalline structure would follow the cementing process to a certain extent in every case, and to a marked extent in enough cases to spell failure for the users of the steel.

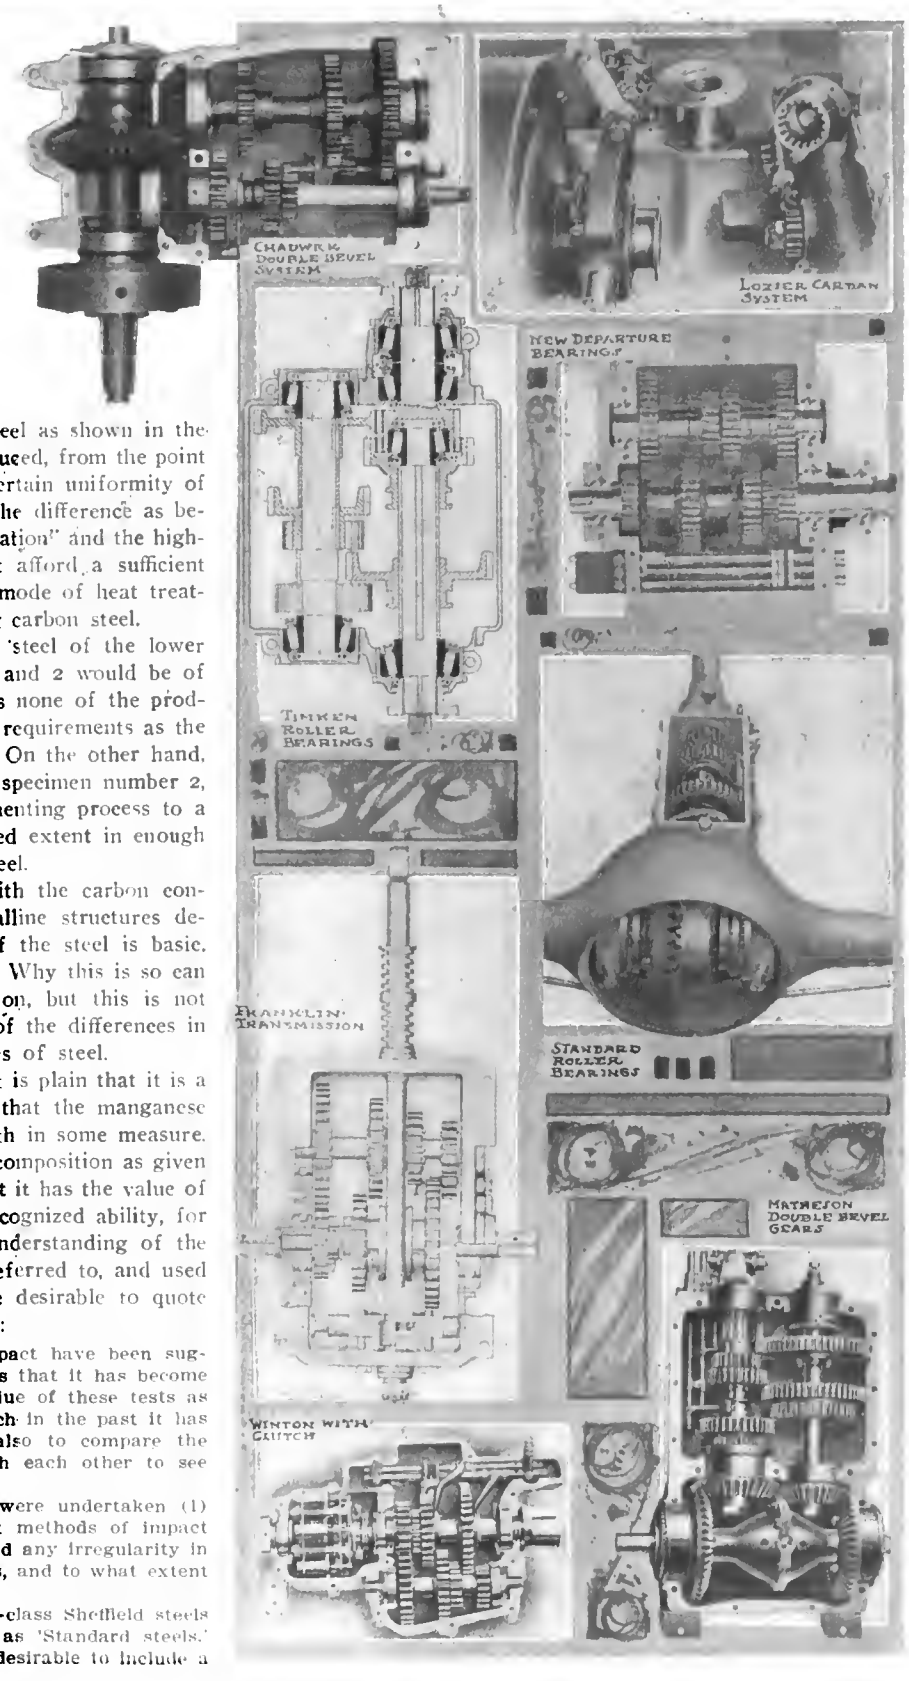
It is especially noticeable that in steel with the carbon content between 20 and about 28 points, crystalline structures develop in the cementing process, especially if the steel is basic, more particularly if it is Bessemer as well. Why this is so can be explained to a fair degree of satisfaction, but this is not the time to launch into the broad question of the differences in the several qualities of the respective grades of steel.

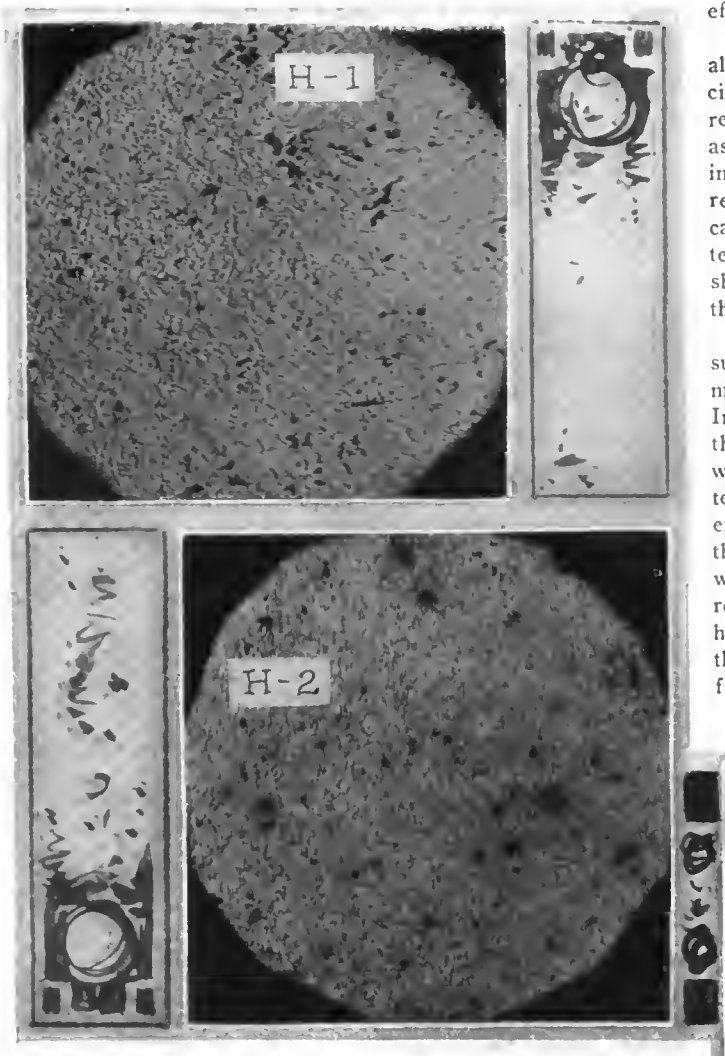
In the steel as given in the tables above, it is plain that it is a fairly pure product in the main, excepting that the manganese is quite high, which accounts for the strength in some measure. It is not the purpose here to claim that the composition as given is absolutely the best to be had for gears, but it has the value of having been selected by a metallurgist of recognized ability, for test purposes. With a view to a better understanding of the manner in which the products given were referred to, and used in the tests by W. F. Harboard, it will be desirable to quote from the paper, as read by him, as follows:

"So many methods of testing steel by impact have been suggested by engineers during the last few years that it has become a matter of importance to investigate the value of these tests as compared with the ordinary tensile tests which in the past it has been customary to rely upon largely, and also to compare the better-known methods of impact testing with each other to see which gives the most concordant results.

"The experiments recorded in this paper were undertaken (1) to compare the results obtained by different methods of impact testing; (2) to see whether such tests detected any irregularity in steel not revealed by the ordinary tensile tests, and to what extent they were in agreement with the latter.

"With this object in view three very high-class Sheffield steels were originally selected, and are referred to as 'Standard steels,' but as the work proceeded it was considered desirable to include a





series of steels made by the Acid Bessemer, Acid Open-Hearth, Basic Bessemer and Basic Open-Hearth processes, so that all steels used by engineers for structural and railway work could be considered.

The acid open-hearth steel as referred to in this discussion was selected for the purpose of determining as to the mode of fixing the effect of "impact" induced in divers way, and that the steel is a fair selection can be taken for granted. In this connection it may be well to point out that "clash gears" are subject to impact to a vast extent, moreover bending moments are predominant to an extent which ofttimes makes for a near approach to the elastic limit.

There is no doubt of the ability of carbon steel, low in carbon (cemented), to serve well for the purpose, if the material is of the acid open-hearth genera, well fabricated, or if the steel is of the crucible process, and comes from "cut" or "cement bars," not of the basic process. If Bessemer steel is used in the crucible charge it is extremely difficult to see wherein the resultant crucible steel is to take rank with acid open-hearth steel, if the composition of the same is low in the metalloids and otherwise unsuited to the work to be done.

In general, according to the methods of reasoning as here utilized, there are two prime considerations: (a) the steel, no matter what the composition, should be from selected ore and scrap, reduced by the acid process; (b) the carbon content should be such as to render the "cementing process" necessary and practicable. These prime considerations take into account the use of the steel in gears, to be used as sliding gears, in automobile work. When opportunity affords, it will be the aim to show that tests are frequently quite unreliable, especially shock or impact tests, whereas none who have had wide experience will be willing to assert that increasing carbon will have any other effect than to decrease ductility, which is most undesirable.

Referring to a long series of carefully conducted tests, using all the known methods of ascertaining the shock ability of special and commercial steels, Harboard ended by saying: "The results cannot be regarded as anything but most unsatisfactory, as there can be no question that as the percentage of carbon increases the ductility decreases." There are many cases of record in which attempts have been made to render inferior carbon steel suitable for use in exacting work. That such attempts have been followed by any very good results has not been shown, yet ever so many have been deceived by the fact that the failures were not flat, or *at their expense*.

In the automobile zone of activity, involving sliding gears, success has followed the use of "acid" steel, low in carbon, cemented; or low in carbon (alloyed) and cemented in some cases. In other instances it was possible to take advantage of other than the cementing process, through the use of alloys such as would engender the requisite hardness, holding the carbon content low enough to eliminate the ills of carbon to any marked extent. If it were possible to give the exact early history of the development of transmission gears, it is believed that history would disclose a vast percentage of the failures as the direct result of the conditions as follows: (a) the use of basic steel, high in carbon, heat treated to engender further rigidity; (b) the use of alloy steel, in which the same basic faults would be found, and in which the "elongation" is, say, 2 inches, fell below 10 per cent. after heat treatment. This question of the heat treatment is one which must be considered from two points of view, for if the steel is cemented and the core is found to hold the requisite qualities, then it is assured that the hard shell is

not at the expense of the dynamic ability of the steel as a whole. If, on the other hand, as a result of quenching and subsequently tempering, the steel evinces a marked falling off in the elongation, it is quite likely that the dynamic life will be short, and in gear work it would be just as well to trust to tool steel, in which failure is assured if it is put into gears.

In the earlier days of the automobile, when it was not well understood that cemented mild steel gears would well serve the purpose, tool steel was used to quite some extent, and the result was a crop of failures which could not be accounted for, although the fact is that some of the steel cost as much as one dollar a pound. It is easy enough, then, to account for the fact that the transmission gearsets as they obtain at the present time can cost very much less than ever before.

Relative Advantages of Alloy Steel Products.

From what has been said it might be thought that alloy steel is not desirable or necessary in work of this character. On the other hand, it is a fact that a vast number of the examples of gearsets used and illustrated in this article are made up with alloy steel gears. They serve so well as to render them above discussion, unless to point out the presence of quality residing within them.

It is the problem of the designer to determine the section of the members, after having decided upon the materials which are to be used. Generally, it is the practice to select the materials, ascertain their characteristics as a result of careful tests under the several conditions likely to obtain in actual practice. By way of illustrating the situation it will be enough to give just such a set of tests as would enable a designer to determine the limiting values of the products in a given service.

It is certainly not necessary to use the same grade of material in all the gears of a transmission system, as, for illustration, the "master gears" do not clash, and they would not have to be of alloy steel of a fine grade, even in the cases using alloy steel for the clash gears. The great gain in recent times was made through the appropriateness of selection, and through the suitable treatment of the steel used in the several parts, considering the service. As a further indication of the extent to which materials can be spread out it is to consider the arduous service of the low-speed pinion in which the material cannot be too good. On the other hand what would be the use of using such fine material in the mate to the pinion? If the pinion with perhaps 14 teeth will do the work, using a given material, it is assured that the mate, with say 39 teeth, would last for ages using the same material. It is said to be desirable to have all the parts of a car last for an equally long time; certainly it is not necessary to have the parts which are easy to design last for an unnecessarily long time at the cost of materials better than would be necessary, on the ground of harmony.

Buyers of cars will not be able to see why some considerable headway has been made in recent times in divers ways, for the reason that it is not plain (on the surface) that matters such as these did receive a due measure of attention. On the other hand, it is plain to be seen that improvements were wrought.

Materials Do Not Have to Be of Some One Grade.

There is no need to use some one grade of steel all through a transmission system, although all the steel used can be low enough in carbon to assure ability to sustain under impact, which phenomena is bound to be present in transmission work to a marked degree. One of the strong points to be made in this article is that the ability of steel to sustain under impact is decreased as the carbon content is increased, and it is urged that alloying be resorted to if strength in excess of that which resides in carbon steel is wanted. This is not to say that carbon should abound in the alloy steel; on the other hand, for kinetic work, it is firmly believed that adding carbon under conditions involving alloys, defeats the aim, if it is desired to attain strength in "diagonal" work. In any case, entirely aside from what will come of the presence of carbon in quantity, if steel is alloyed,

NOTE.—The steel as given in this table is that as used in many of the best makes of cars, in which kinetic ability is pronounced.

the fact remains that more skill is required to deliver the best results in the presence of carbon than is the case when the steel is very low in the same.

Data in Relation to the Table of Steel Values.

In the table the limits are given in such a way as to enable the designer to take into account the maximum possible result if the steel is properly treated, and the minimum likely result in average good practice. No reference is made to "cementing" results, in view of the fact that in a cemented section the core should show about the same as is here given for tempering and annealing—the shell should be glass hard.

Referring again to the table, it is to note that the materials belong to the classes as follows:

BCH = Special carbon steel in which the carbon is under 10 points, but in which the manganese is quite high (above 0.80) and the metalloids are very low indeed. This steel is especially for parts to be cemented.

RHB = A grade of carbon steel in which the carbon does not exceed 16 points and holds above 10 points. This is a true "cementing" steel, in which the effect of carbon up to that due to 16 points should be taken into account. In this steel it is desirable to hold the metalloids at a low ebb and the manganese should be quite high.

CDH = Steel of the nickel genera, in which the carbon ranges between 18 and 20 points, and the steel is suitable for use in the die (drop) forged state.

HVD = A high carbon (45 points) steel to be used in a limited way in parts not subjected to shock to an extent requiring the use of materials of a highly kinetic character.

PLH = Fibrous iron (puddle iron), which is the iron of the wagon maker in the past. This material is used for many purposes in a good class of automobiles, even for gears and axles (cemented), in which the carbon is as low as 4 points.

BNC = Chrome nickel steel, in which the carbon and manganese are low, and in which the metalloids are very low indeed.

BND = Another grade of chrome nickel steel, in which the manganese is quite high, and in which the carbon is a little higher than in BNC.

With information such as this before the designer it is easy to predict that the product will be harmonious, if it can be said that the "purchasing" representatives will procure the same material for the parts later on. It is possible under such circumstances to take into account the matter of the design as it relates to "notched" (nicked) bars as they perform in the "Fremont" test, and it is also easy to ascertain the dynamic responsibility of the parts such as will not suffer as a matter of design from the point of view of the notched bar. Irregular designs should be regarded in the light of "notched" bars; the performance in practice will be very much in the same way.

(To be continued.)

TRUE STORY OF THE AUTOMOBILE TIRE

By H. S. FIRESTONE, President Firestone Tire and Rubber Company.

EVERY practical automobilist knows that the pleasure or discomfort of an auto ride depends largely upon the tires, hut how many of them know anything about the "life story" of these scapegoats of motordom? It is a story of immense human effort in the crude rubber forest and the cotton field —a chapter, not only of interest to the automobilist, but to the average citizen as well.

Native Tapping Wild Rubber Tree.

Civilization first heard of rubber in Herrera's account of the second voyage of Columbus in the year 1493, where he speaks of elastic balls made by the natives from the gum of a tree.

The first authentic account of its practical use was recorded in 1745 by the leader of a French Governmental expedition returning from South America who reported that the natives secured from the juice of a tree a certain gum which was very elastic, impervious to water and used in making bottles, shoes and squirt guns.

Thirty years later it was introduced to commerce when an Englishman brought from Assam, India, a soft spongy substance which would erase lead pencil marks and which afterwards became known as India rubber.

Many primitive uses were found for this wonderful gum, but owing to its susceptibility to changes of temperature, which rendered it sticky and more or less fluid, rubber did not come into its own until early in the last century. At that time it was discovered after a great deal of experiment, that by mixing sulphur with crude rubber and subjecting it to a high degree of heat, these former deficiencies were eliminated and a material was produced which was both tough and elastic, and would retain those properties under varying temperatures. This process of curing was called vulcanization and is the basis of rubber making to-day.

So great has been the development of rubber manufacture since that time that its products now exceed a value of five hundred million dollars annually.

Contrary to the popular impression rubber gum is not derived from the sap. It is secured from a milky juice or *latex* which is found only in the bark. This *latex* contains a substance known as caoutchouc (the active principle of rubber), together with certain albuminoids, resins, etc., which upon the evaporation of moisture coagulate, forming a thick, spongy substance. The percentage of caoutchouc, in proportion to other ingredients contained in the *latex*, determines the quality of the rubber.

The regions from which rubber gum is secured form an irregular belt in the tropics and sub-tropics extending around the earth, the quality procured varying greatly according to the species of plant, the soil and the climate. Great quantities are produced in Africa, Mexico, Ceylon and the Malay Islands, but the most desirable rubber for resiliency and wear resistance is secured from a tree found in the Amazon River district, South America. This rubber is known as Para, the name being derived from its chief city of export. It not only contains as high as 95 per cent. of caoutchouc, but the methods used by the natives in preparing it for market are so much superior that it is selected in preference to all others for the manufacture of the best automobile tires.

Rubber gathering in the Amazon River district is a hazardous and difficult undertaking. The supply comes from wild trees scattered throughout dense forests, to which paths must be cut through the tangled and luxuriant undergrowth. Even then, the trees can only be reached during three to five months of the year, as throughout the wet season the forests are completely inundated. The climate is so unhealthy that white men cannot do this work and it is necessary to rely upon the native blacks, who at best are undependable and lazy. Their reluctance to join rubber gathering expeditions can readily be understood when it is remembered that out of a season's expedition perhaps only half will return alive.

When a rubber tree is found the native gatherer cuts a series of gashes into the bark with his machete, encircling the tree from the ground up, as high as he can reach. Cups are fastened to catch the *latex* as it oozes out. When a sufficient quantity is collected it is removed to the temporary hut where a dense smoke-producing fire is made of certain nuts and palm leaves. Then taking his wooden paddle the native dips it into the *latex* and holds it over the fire, turning it round and round until the *latex* coagulates. As soon as it is hard a new layer of *latex* is added and coagulated as before. This process is continued until the mass has grown too large for handling, when the paddle is taken out and the rubber set aside for export. In this form it is known as a ham or biscuit of Para. The process of coagulation and fumigation with these specially selected nuts and leaves prevents decay and adds to the life and wear resistance of the manufactured product.

Tapping the trees for rubber does not necessarily destroy them, nor is it believed to materially shorten their life; but unfortunately many thousands of trees are annually rendered useless by careless and improper methods. Although the source of crude rubber gum is practically inexhaustible, the limited native labor supply and the difficulties encountered up to the time of marketing it have tended to keep down the supply and maintain a high

Tapping Trees on a Plantation Where Cultivation Has Made Progress.

cost of production. The output has been increasing steadily, but has not yet been able to keep pace with the enormously increasing demand for manufacturing purposes.

In order to obviate the difficulties encountered in gathering wild rubber and facilitate production, artificial cultivation has been resorted to in various localities. Scores of millions of dollars have been lost in ventures of this character, many of them merely wild-cat promoted schemes. It is estimated now, however, that there are 300,000 acres of rubber plantations in Ceylon and the Malay region and 100,000 acres elsewhere, principally in Mexico, some of which have already started to yield and promise handsome returns to investors.

In other localities rubber is collected and coagulated by a variety of methods. Africa, for instance, produces quantities of rubber from various species of vines, roots and even grasses which are destroyed in order to secure the *latex*, but which are rapidly replaced by new growth. These rubbers are designated by many different names, chiefly from their locality or the name of the native tribe gathering them. The methods of coagulation are very crude: some by evaporation, some by plant acids and others

Smoking Process to Render the Rubber Immune During Shipment.

by smearing over the bodies of the natives. The proportion of caoutchouc in some of these rubbers runs as low as 60 per cent., but each has its own particular place in the general manufacturing field.

Next to rubber the most important material in a pneumatic tire is the fabric which gives form and rigidity to the tire. Extensive experiments have been made with all textiles to secure a fabric, which in the finished condition will combine best with rubber, be unaffected by the chemical action in manufacture and demonstrate the greatest strength. Silk and linen show great strength, but when combined with rubber will not produce the results which can be obtained from cotton. There are many grades of cotton, the best of which is long staple Sea Island. It is erroneously supposed that this cotton grows exclusively on islands off the coast of South Carolina, but, in fact, only the seed comes from these islands, the supply being grown on the mainland. The next best cotton comes from Egypt, which grade for grade, is estimated to average about 20 per cent. less strong than Sea Island.

There has been a great amount of thought, time and money devoted to the combination of rubber and fabric into a successful pneumatic tire and develop it to its present stage of perfection. The scope of this expenditure is well illustrated by the fact that 1,641 patents have been issued in the United States since the first one, May 8, 1847, to say nothing of the numerous patents on solid and cushion tires. It is needless to say that many of these patents have come to nought, and that most of the men embarking in the business have failed to succeed. The development of the rubber tire has been the survival of the fittest, and the outlook is in favor of a continuation of this same compound.

ELECTRIC AND GASOLINE WILL NOT COMPETE.

CLEVELAND, Feb. 8.—Gasoline and electric cars do not compete in any sense of the word, according to Hayden Eames, general manager of the Studebaker Automobile Company. Mr. Eames says: "Each is designed for a different purpose and far from being rivals, they are for the most part allies. The electric is the city car par excellence. As a substitute for the touring car it is a failure. Its sphere is bounded by the area of the paved streets. Nor is the common idea that the scope of the electric is confined to ladies' use correct. On the contrary, while it is the only type of motor vehicle a lady ever should drive, because of its simplicity, lack of complications and immaculateness, yet its larger field is in the everyday service of the business man. Few people realize how rapidly rubber is ground off tires on a heavy touring car by the frequent releasing of the clutch, changing of gears, effort of stopping and starting, and the still more wicked grinding consequent on turning sharply to avoid or to circumvent street cars and wagons. Now, the electric is free from all this. It starts gradually and stops with small effort because its speed is at no time great.

"One of the factors that have retarded a proper understanding of the electric was the facility or means for charging the batteries home. To maintain a car at a garage costs about $30 per month, and there is the inconvenience of having to telephone for it and sending it back for recharging. This condition no longer obtains. The rectifier has revolutionized all that. This device, for transforming the ordinary electric current and automatically recharging the batteries, can be set up in your own barn or garage, and the total cost of maintaining a good electric will cost less than $6 a month, tires and everything included. Say $10 a month, year in and year out, to cover the price of renewal of batteries, repairs and current cost. In cities where rates for current are low it will average $7 per month."

DAME RUMOR BUSY WITH E. M. F. COMPANY.

DETROIT, Feb. 8.—The latest rumor has it that William Metzger has quit the E. M. F. Company. Last week the rumor coupled the selfsame item with Mr. Flanders, while the week before the same report was made relative to Mr. Everitt. According to the latter, the affairs of the concern have been the cause of much discussion among competitors, but as this is by way of free advertising to which a denial simply adds, the officers mentioned really do not mind it. In fact, as Mr. Everitt put it: "Seems as if some person interested in bringing about the dissolution of the 'All Star Cast' invented the yarn before the consolidation was actually effected and ever since, at frequent intervals." Continuing, Mr. Everitt said: "But now you tell me Bill Metzger has quit—or was it me this time? Well, if you ever hear again that Bill is out, let me know confidentially and I'll give him another job. He can have the same old one back again, because a concern that is producing 12,000 cars a year needs a mighty good sales manager, and I believe Metzger is the best in the world."

In the meantime, E. M. F. cars are taking like "hot cakes."

LETTERS INTERESTING AND INSTRUCTIVE

THE BEARINGS ARE MADE VERY MUCH LONGER.

Editor THE AUTOMOBILE:

[1,741.]—In letter number 1,714, of January 28, the subject matter makes me think. I have a two-cycle motor (horizontal) which gives me lubrication trouble in connection with the crank. Oil will not stay in the crankcase, but works back to the combustion chamber, thus destroying the balance of the mixture. There is a drip cup placed to feed oil to the crankcase through the intake, and if gasoline destroys the qualities of the lubricating oil, the question is: how is the crankshaft to be lubricated?

Does a two-cycle engine require a special carbureter?

Would it be safe to put a check-valve between the carbureter and the crankcase to keep "back-firing" out of the carbureter?

Belton, S. C. G. D. ROGERS.

In your case it would seem as if the trouble is due to the fact that lubricating oil (in excess) seeps through, by the piston, and destroys the integrity of the mixture, as well as "fouling" the spark-plugs. This would happen in the case, as you cite it, whether or not the motor is two or four-cycle.

In two-cycle motors, in general, means are provided for adequately oiling the crankshaft, and the bearings are made very long, to serve as packing for the crankcase compression, with the result that lubrication does not have to be profuse. Then, it is a fact that the gasoline vapor, which is really what has to be dealt with, is not the same as liquid gasoline in the lubrication oil.

A check-valve is usually placed between the carbureter and the crankcase to entrap the compression, unless the carbureter is so designed as to accomplish the purpose. Back-firing is due to the fact that the mixture is not with the right proportion of air to gasoline. If you will provide a means of holding a crankcase compression, and then adjust the carbureter so the mixture will be in accord with the needs of the motor, it is believed that your troubles will be materially reduced.

A shield of sheet iron over the ends of the cylinders (with a slot in it for the connecting rod to play in) will prevent the lubricating oil from going by, even if the shield is not so very tight. Your troubles will largely disappear if you will get up a crankcase compression, and prevent the lubricating oil from passing into the combustion chamber. A good carbureter is desirable, but it does not of necessity have to be especially designed for two-cycle work.

THE BEST PRACTICE IN BATTERY CONNECTIONS.

Editor THE AUTOMOBILE:

[1,742.]—I have nine cells of battery and I want to know if it is not better to arrange them in series-parallel rather than in series. If they are in series, and if the circuit opens at any point, then it is plain that the whole battery is put out of action. What is the matter with the idea of series-parallel wiring, in which it would appear that the battery will not be shut down if the circuit opens at some one point?

New York City. F. H. THOMPSON.

Your arrangement of three series of three cells of battery affords you the electromotive force of three cells of battery, and the ampere rate of flow of current of three cells of battery in parallel. It would be the same thing were you to buy three big cells of battery, each one of which to have the capacity of three of the small cells, such as you might put in series-parallel. If the voltage due to three cells of battery is high enough (which is probably not the case, in view of the fact that you show dry-cells), you can proceed as you suggest, but three big cells of battery would be superior for the purpose, since then you would have many less connections to watch. Two series of four good-sized cells would be better for the purpose, unless it is that the coil you use is one requiring a higher voltage than that resultant of the use of four cells of dry battery. In the case of the two sets of four cells of battery it would be better to use one as the working set and the other for emergency purposes. It is true that good cells of battery will deteriorate if they are connected to cells that are run down.

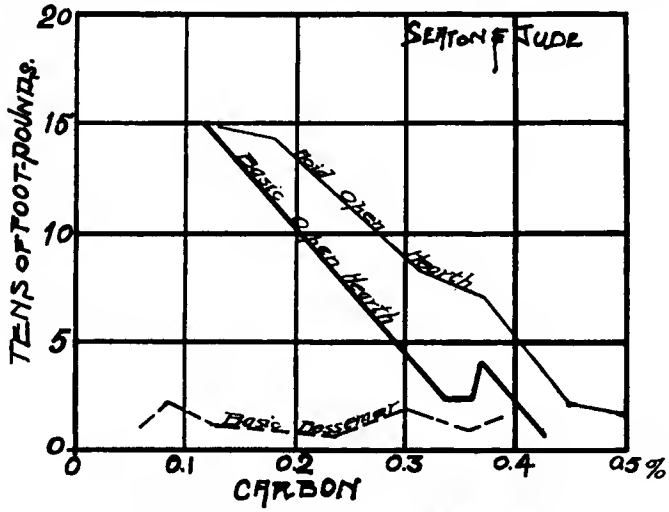
IMPACT RELATION OF VARIOUS STEELS.

Editor THE AUTOMOBILE:

[1,743.]—Since automobile parts are subject to impact to a great extent, the question is: What is the relative value of the several generic types of steel? In other words, is Bessemer steel so very much inferior, and is acid open-hearth steel better than basic open-hearth product? Then, there is the question of carbon content to take into account; what can be said to indicate with some force of clearness the true situation?

New York City. PLUMBAGO.

The questions asked might be cleared up in a volume of many pages, in so far as the knowledge on the subject is capable of inviting clearness. In such limited space as this it may be well to trust to a diagram or chart, showing the relations. Just such a diagram is the one to be found in the paper by F. W. Harboard, read before the Institute of Mechanical Engineers (English) November 20, 1908. This chart is reproduced here, in which (a) increasing carbon indicates decreased impact ability; (b) basic Bessemer steel has the least ability; (c) basic open-hearth steel



Curves Showing Impact Ability of Steel Products.

stands next to the lowest; (d) acid open-hearth stands the highest of the three. In view of the information afforded by the chart it is plain that acid open-hearth steel low in carbon is the steel to use (considering carbon steel) if the impact ability is to be a maximum. In this discussion crucible steel is not involved. Nor is the acid Bessemer product taken into account. The conclusions here reached are in good accord with the general facts, hence the chart is corroborative, and it has the virtue of being in full accord with the latest advices in relation to this important matter.

HOUSE MOVERS USE WOODEN ROLLERS.

Editor THE AUTOMOBILE:

[1,744.]—I note under the heading "Letters Interesting and Instructive," No. 1,714, January 28, that you make the statement that lubricating oil is ruined if diluted with kerosene or gasoline. This is a most natural assumption, but cannot be a fact inasmuch as I used for two weeks last summer a motor boat driven by a two-cylinder, two-cycle, two-port motor, having a bore and stroke of 5 inches x 5 1-2 inches and rated at 8 horsepower, which depended for lubrication of the crank pin, wrist pin and piston solely upon lubricating oil mixed with the gasoline in the tank and entering the crankcase via the carbureter. The motor turned at 800 revolutions per minute, and did not overheat during a five-hour full-speed run. This method of lubrication was not accomplished at the expense of other necessary features, as the pistons fitted tightly enough to show a compression of 60 pounds on a compression gauge when turned over by hand. Two pints of cylinder oil were mixed with each five gallons of gasoline. By this letter I do not wish to go on record as advocating this makeshift method of lubrication, as the scheme would not work at all with a four-cycle engine, and

doubtless interfered with the efficiency of the two-cycle, but the fact is it lubricated.

Dorchester, Mass. FRANK P. HAWKINS.

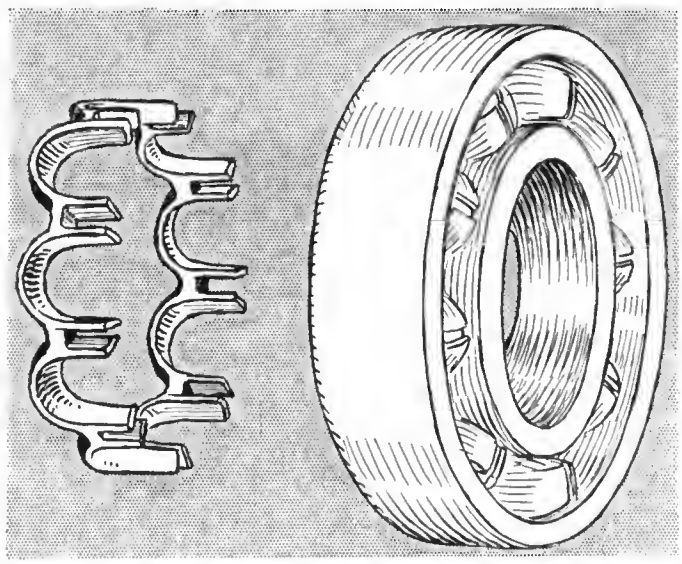
In your case it is plain that the gasoline was provided with lubricating properties to some extent, but it cannot be shown by you that the whole constituted a "lubricant" in the sense of the word as taken when serious work is to be done.

It is not plain that the cycles have to be lubricated, and to whatever extent the gasoline with lubricating oil will serve as a lubricant it will so serve in a two or in a four-cycle motor. Gasoline is absolutely not a lubricant, nor is kerosene. It is a fact also that lubricating oil in which either of these liquids is mixed will lose its ability to sustain under pressure. The fact that you ran a two-cycle motor for two weeks using gasoline in which some lubricating oil was dumped proves nothing. There are instances of record showing that bearings have run for years on water. The bearings were so big in proportion to the work that the pressure was not enough to cause seizing provided the heat was absorbed by a non-lubricating liquid; in this case, water.

SEPARATORS IN HESS-BRIGHT BALL BEARINGS.

Editor THE AUTOMOBILE:

[1,745.]—We are pleased to see the notice you have given our bearing on page 956 of your issue of December 31. At the same time we regret that an error has crept into this description, since



Spacers in Modern Hess-Bright Ball Bearings.

the separator you are describing as being made in halves must be that of some other make of bearing. Our separator is not made in halves; it is a single, high-grade bronze casting, with pockets milled out to a slightly larger sphere than the balls. This separator is inserted and after it is in place the projecting prongs are bent over in a die so that the balls are practically entirely enclosed.

We are sending you by mail a separator, as well as a completed bearing with the separator in place. From the above description you can readily see the actual construction.

We should very much apreciate it were you to give this correction space and were you to show an illustration by your sketch artist to make the matter clear.

Philadelphia, Pa. HESS-BRIGHT MFG. Co.

Annular ball-bearings of the "silent type" have been put out in divers ways, with separators, as springs, etc., and the plan, on the whole, has been of the greatest value in automobile work. If the balls cannot come into contact with each other it is true that noise will be aborted, and since there is no occasion for having a full complement of balls it is the practice to turn out "silent" ball bearings with separators to aid in the process.

The illustration given is of the Hess-Bright annular type, showing the separator in place, which separator is a bronze member suitably fashioned for the purpose, which has the shape as shown above before it is inserted into place. When the separator is placed, in the process of assembling the ball bearings, it is then subjected to a bending process.

FLEXIBLE SHAFT WANTED FOR A SPEEDOMETER.

Editor THE AUTOMOBILE:

[1,746.]—Will you please inform me through the medium of "Letters Interesting and Instructive" where I can obtain a flexible spring shaft for a Lea speedometer? I understand that they are not manufactured any longer, and I can find no one who can inform me as to repair parts. Can you tell me if the Duryea rotary valve achieved any success, and kindly tell me in what issue of "The Automobile" I can find description of same? Have nearly two years' issue, and know I have that particular one, but cannot find it.

When are you going to place those excellent articles of T. J. Fay before us in book form? They should meet with ready sales.

Chicago, Ill. E. A. MARTENS.

Every supply house of any pretence will be able to procure for you the very flexible shaft you seem to want.

The Duryea rotary valve was looked upon as a good success. Confer by mail with Charles E. Duryea, Reading, Pa.

No date can be fixed for the publication, in book form, of the articles by Thomas J. Fay.

TO IMPROVE GRADES OF BABBITT.

Editor THE AUTOMOBILE:

[1,747.]—I understand that ordinary grades of Babbitt can be so much improved as to eliminate the main objection. You tell so many things, it is possible you can cast light upon this subject also.

Binghamton, N. Y. XENTH.

If the inferior grades of Babbitt are melted in a crucible (a cast-iron pot will do) and if tin is added until the metal is rendered quite brittle, when in the solid state, it will then be fairly good as a bearing metal. Keep the surface of the molten mass covered with charcoal in the powder form to prevent loss of metal and to render the process healthy. The fumes of lead are not safe to inhale.

BECOMES DINGY AND DIFFICULT TO RESTORE.

Editor THE AUTOMOBILE:

[1,748.]—Is there any way to clean carbide burners after they are reduced to a state of corrosion?

What will remove the dingy appearance of celluloid?

Florence, S. C. M. A. W.

It is believed that the crust is an insoluble carbide, and it is true that in the removal of the carbide the metal will be reduced.

Celluloid becomes opaque in time and, in view of its low price, to replace it would seem to be the wise course.

PHASES OF AUTOMOBILE LAWS TO CONSIDER.

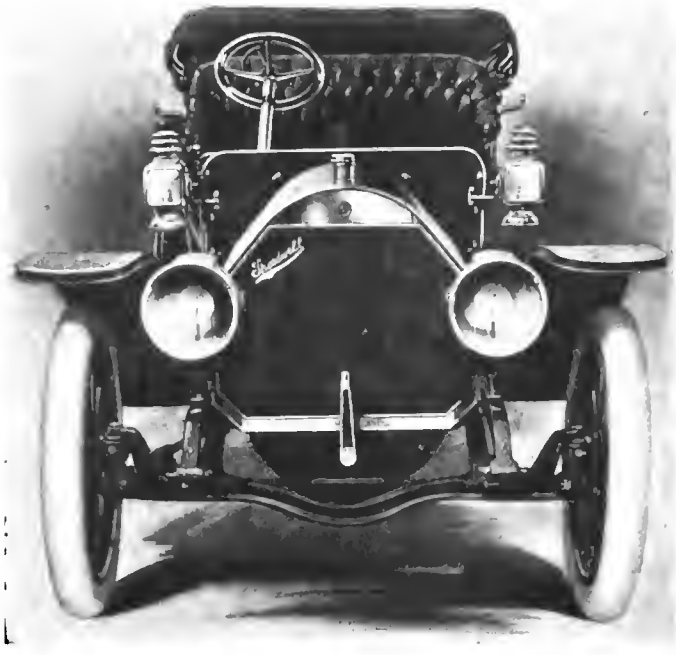
Editor THE AUTOMOBILE:

[1,749.]—In reference to your article entitled "Efforts Toward Uniform Automobile Laws," I wish to call your attention to Sec. 6, Subdivision 3, the latter half of which reads, "and if traveling in the same direction, use reasonable caution in thereafter passing such horse or animal, providing that in case such horse or animal appears badly frightened or the person operating such vehicle is requested so to do, such person shall cause the motor of such vehicle to cease running so long as it shall be reasonably necessary to prevent accident and insure the safety of others." If I understand this correctly, it means that if an automobile driver is driving in the same direction as the horse and the animal appears frightened, the automobile driver shall be obliged to stop his engine. How is this driver going to pass the horse? I believe that in that respect the laws of the State of Wisconsin cannot be improved upon, which read as follows: "Every person operating an automobile or other similar motor vehicle upon or along any public highway shall upon a signal by putting up the hand or other sign of distress, made by a person riding or driving a horse or horses, which are frightened, cause such automobile or other similar motor vehicle to stop, unless a movement forward is necessary to avoid accident or injury, and upon request shall stop all motor power until such horse or horses are under control; and shall, if requested, assist such person or persons to pass such automobile or other similar motor vehicle in safety. All motor power shall be stopped on any automobile or other similar motor vehicle while left unattended on the public highway." I have seen many times when a horse, on account of fright, will begin to back the buggy around and in almost every case the automobilist has had a very narrow escape if it had not been for him moving out of the way, which he would not be able to do in case his engine were shut down.

I also believe that in a case like this, where the engine is down, the automobilist should be exempt from any liability on account of collision.

Phillips, Wis. ARTHUR BEYER.

1909 Speedwell



End on the Radiator Looks Very Artistic.

SIMPLICITY which lends itself to economy is the keynote of the Speedwell Motor Car Company, of this city, makers of the Speedwell, a moderate-priced car. So far is this idea carried that the manufacturers, now entering upon their third year, feel safe in the statement, "The Speedwell price ($2,500) is the highest price that should be paid for the best motor car built." At this price, too, the product is all that can be desired in the way of material, workmanship and accessories.

Thus, taking up the details, the motor is found to be of 40 horsepower rating, but actually capable of delivering 50. The cylinders are cast individually, in the belief that cylinders so cast are more uniform than larger, more complicated castings could possibly be. The valves located on the side are operated from a single camshaft. The bore of the cylinders is 4 3-4 inches and the stroke 5 inches, and the cylinders, pistons, piston rings, crankshaft and all working parts are accurately ground. The valves are very large, of nickel steel, and operate entirely without noise. The power plant is completely self-contained with an an adjustable ball-bearing fan which is mounted on the front, the commutator being on top of the engine and very accessible. Following modern practice, the crankshaft is offset from the center line of the cylinders, reducing cylinder wear, lessening vibration and increasing the efficiency of the motor.

Well Worked-out Lubrication.—The lubricating system is very well thought out, there being but a single place on the entire engine to introduce oil. Three gallons of oil are introduced through this receiving part, which passes directly to the sub-base of the engine. In the commutator shaft column is a pump, the duplicate of the water pump, which pumps the oil to the engine in large quantities, which tends to wash and keep it clean, the oil in turn overflowing and passing down through a filter to the sub-base again, the process to be repeated. This gives an excess of oil at all times for lubricating purposes, yet as the oil cannot accumulate in the upper base the spark plugs of the Speedwell car are never fouled.

The carbureter is of the very latest automatic type with a hot-water jacket. By means of this jacket the gas is kept at a constant temperature throughout the year, and the fuel system is therefore not affected by heat or cold, or by dry or moist atmosphere, or other weather conditions.

Double ignition is provided, using two sets of spark plugs, one system being entirely independent of the other. The battery supplies the spark coil and one set of plugs, and the Bosch magneto supplies the other set of plugs, and in the event of accident to one system the other system is entirely independent.

The cooling of the engine is taken care of by a genuine square-tube honeycomb radiator which is very efficient. This, together with the direct-driven gear pump, makes a frequent supply of fresh water unnecessary.

The motor is controlled by spark and throttle levers on top of the steering wheel. In addition, an auxiliary air inlet between the carbureter and the motor is provided which is operated by a foot pedal. At extreme high speed, or when great power is necessary, this auxiliary air inlet can be opened gradually by the foot pedal, thus giving to the engine the maximum amount of air it will take. The extra power obtained by this device is surprising and it is a great feature for those who wish high speed and powerful hill-climbing abilities.

The clutch, which is interposed between the engine and transmission, is of the cone type, leather faced. A very large square section spring may be adjusted externally, the thrust of it being well taken care of by ball thrust bearings. The shifter, in addition, runs upon ball bearings, so that there is very little opportunity in the entire clutch mechanism for wear. The universal joint between the clutch and transmission is a combination of a slip joint with a universal. It is of very stout construction, completely housed in to exclude dirt, and well provided for in the matter of lubrication.

An Improved Transmission.—The transmission shows many new and valuable improvements which are mostly by way of minor details of design or construction, but which are invaluable in the more severe daily use. Thus in the single matter of leakage of oil or grease out of the bushings in the case, much lubricant is lost and money wasted. On the gearbox of this car a stuffing box is provided for both ends of the driving shaft which entirely eliminates any grease or oil escaping, a common fault of nearly all cars. The telescoping or driving shaft is provided with a long and very efficient roller bearing. Both shafts

Side View, Depicting Wide Entrance and Absence of Obstruction.

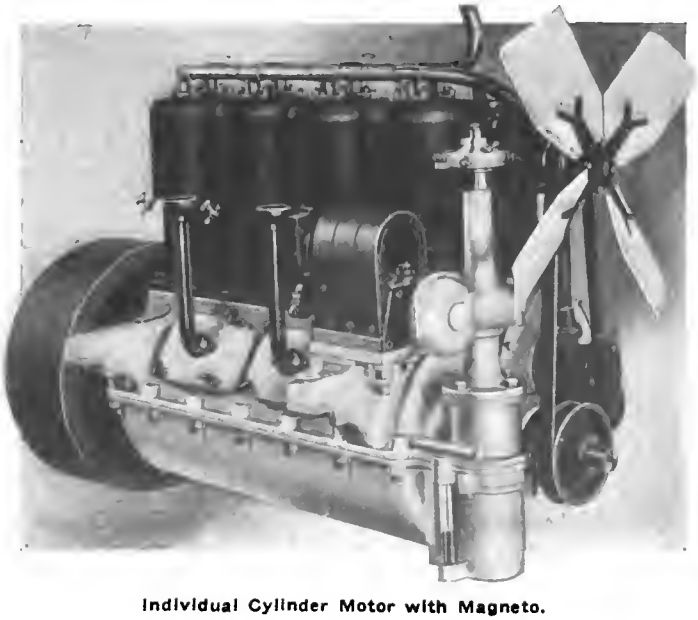
Rear Axle in One Piece of Drawn Steel.

are themselves mounted on large Timken roller bearings. The construction of the driving shaft follows the very latest practice, having the keys milled integral with the shaft for the sliding gears. This permits a greater cross section of metal to be used as compared with former constructions of a square shaft, and it also adds strength. The gears and shafts are formed from a special alloy of vanadium steel, and both gears and shafts are hardened and accurately ground. The transmission is of the selective type with three speeds forward and reverse. The direct drive is on the third or high speed. All gears are of special gear alloy, containing vanadium as the principal constituent. This material, it is well known, is unexcelled for this use, although its excessive cost hinders the use in any but the highest priced cars. Three gear ratios are provided and the purchaser is given the option of 2 1-2 to 1, 3 to 1 or 3 1-2 to 1.

Axles Show Careful Designing.—The front axle is a one-piece drop forging of I-beam section, which, after being finished, is given a special heat treatment. A special feature of this axle is the fact that the steering heads themselves as well as the wheel spindles revolve on large Timken roller bearings. This makes steering easy, and the wear slight.

The rear axle is of the full floating type, the floating axles themselves carrying no weight whatever, the weight of the car being carried on the outside of the tubing. The floating axles are also heat treated. The housing for the rear axle is one piece drawn steel which is very symmetrical and is built entirely without the use of strut rods, rivets or brazing. The differential, the bevel gears and all the bearings are mounted on a frame which can be quickly withdrawn for inspection from this pressed steel housing. This new axle is the most wonderful example of the diemaker's art. The arrangement of the parts is such that all adjustments may be made from the outside, which is a little refinement that old drivers can testify to the sterling worth of.

The liberal, one might almost say excessive, use of roller bearings will be at once remarked. Inasmuch as published figures give the consumption of power for plain bearings as 2 per cent. and of rollers as 1-4 of 1 per cent., it may be seen at once what a great saving this liberal use of them effects. In fact, it is equivalent to a much more powerful engine in that the power delivered to the rear wheels is increased by just such a percentage for every roller bearing used.



Individual Cylinder Motor with Magneto.

Large, Liberal Brakes Are Provided.—The brakes are very large and powerful and are double on each rear wheel, being 2 1-2 inches wide by 14 inches in diameter, both brakes being equalized. It is thus possible to load the car heavier on one side than on the other and still have both brakes operate alike, a great preventive of skidding.

The steering gear is very large and substantial and is of the worm and complete gear type. This gear may be revolved at four different points, bringing into operation four different sets of teeth. This makes, in reality, four different steering gears in one, and should even outlast the car. It is adjustable for every move. Its bearings are very large and all the parts are hardened and ground. The steering wheel is an aluminum web, the wood being laminated on the rim. The touring car and limousine types have a 16-inch wheel and the roadster 18-inch wheels. The advantages of this unit construction of steering wheel, rim and spider over the usual practice of attaching the rim by means of three or four small screws cannot be overestimated. In case of trouble, where the utmost dependence upon the steering arrangement is necessary, the driver will always have complete confidence in this member, knowing that there are no wood screws to work out, leaving the bare rim in the hands of the astonished driver.

Front Axle with Timken Roller Bearing Knuckles.

The wheels are 34 by 4-inch all around except in the limousines and seven-passenger cars, in which case the size of the tires are increased. The wheelbase is 120 inches and the tread 56 inches.

The car is built in three different types: touring cars for five and seven passengers, limousines, roadsters with single or double rumbles or with military seats and with a baby tonneau body. The springs are of an exceptionally fine quality and are double heat treated and oil tempered.

The front and rear springs are both of the now-popular long, flat, semi-elliptic type, the former being shackled at the rear and through the frame. Rebound clips are fitted on both and full provision is made for oiling.

The body lines are straight, and the long extended fenders give a somewhat low, racy appearance. The bodywork is of a high order, as is also the painting.

The car is completely equipped with two gas lights, generator, two side lamps, tail lamp, horn, jack, tool kit, tire repair kit, tire pump, battery, battery box, Bosch magneto, robe rail and foot rail.

The price, $2,500, includes the extras mentioned above, but the top shown in the side view of the touring car is an extra, listed at $125. So, too, are the extra revolving seats in the tonneau, two in number, which with 4 1-2-inch tires all round, for the man who wants larger tires, list at $100—that is, $100 for both.

CALIFORNIA ALIVE TO THE NEED OF HIGHWAYS

SAN FRANCISCO, CAL., Feb. 1.—At the State Legislature, now convening at Sacramento, much discussion and rather heated debate has taken place with regard to the good roads movement. Two propositions were made; the first, being backed by the Governor, was the proposal to issue bonds to the amount of $18,000,000 for a great system of State highways. The Association of Good Roads proposed that the State should assume control and maintenance of such parts of the roads built by the counties as would be accepted by the State as part of the system. The great point of controversy threatened to be whether a State commission or the State Engineer and his advisory board should have the handling of the matter. The association wanted a commission.

The Governor stated that he wanted no more commissions, and for a little while it looked like a war. After a conference it was decided that each side should draw up their bill and they should be presented. The Governor, in speaking to the members of the association, expressed himself as follows:

"I want to co-operate with the committee from your association in framing a bill so that it will create a concrete State road system and provide for its future maintenance, but we must come together on this subject. When the counties issue bonds and build roads that are a part of the State system we will provide that such roads are to be maintained by the State. But I do not like the tentative bill presented by the executive committee of the association. It was drawn by men not familiar with legislation, as was evidenced by the provision for nine-year terms of office, when our law limits the term of officials to four years, unless otherwise provided in the constitution. I don't like the provision for a commission of three members, each at a salary of $3,600 a year. I want the work of supervising centered in the State Engineer's office. When I get $3,600 a year to pay a man I want to get an expert from Washington, who has been brought up on road building and knows every scientific detail of it. I want to put that expert out on the road and make him work with his coat off; then, if he doesn't make good, off comes his head. But if I have a commission on my hands, I cannot remove its members at will. If they don't make good I am saddled with them for four years. So I want the supervision of the road building centered in the State Engineer's office, where it can be under experts. Then, again, in the association's tentative bill is a provision that would saddle the State with a whole lot of county roads that have nothing to do with a State system. I want arterial roads running down the valleys from one county seat to another, with branches to cities and towns of importance and connections in the necessary places." This clearly showed the chief executive's opinion.

On the other hand, the association, through its secretary, said: "The State Engineer's office is too busy with river work, harbor work and the work of supervising State buildings to give the requisite time to road building. In other States the best results have been secured through a commission, and we want a commission of the best road men in the State."

The chairman of the commission stated that public sentiment was so aroused in the matter of good roads that it would force the appointment of good commissioners and hold the commission up to its work. A committee of the association called on Attorney-General Webb and talked over road matters. The Attorney-General advised them to get together with the Governor and agree on a bill. This was done and the committeemen saw that there was merit in the Governor's views and agreed to abandon their contention for a commission. They have agreed to pull in the same harness, and the Governor will offer two bills, one to submit to the voters of the State the proposition to bond the State for $18,000,000 for the construction of a system of highways, and the other to provide for a survey of the proposed system of highways. The Governor realized that if every effort is centered on the bonding proposition there will be little road work done until two years hence, when the proposition of bonding is submitted, and, in the event of the bonds being defeated, road work would get a terrible setback. To enable the counties to go ahead with their plans, the proposal has been made to survey the State and define the roads that will constitute the main State highway. With these defined, the counties may then proceed with the improvement of the roads that will act as feeders, so that when the State system is constructed the county system will be complete and fit in. Definite action and the adoption of the bills have not been decided upon, but good work is being done and there is little doubt of the outcome.

Among the Giant Redwoods of Marin County, Cal.

MICHIGAN SUPERVISORS FAVOR STATE LICENSE.

LANSING, MICH., Feb. 6.—The State Supervisors' Association, which is holding a convention in this city, has gone on record as favoring a law requiring automobile owners to pay a State license of $10, the fund thus collected to be used for the construction of good roads. The supervisors were of the opinion that automobiles do more damage to the roads than any other vehicle.

Resolutions were adopted endorsing the State Highway Department, as conducted by Commissioner Earle, who has lately been the target for considerable criticism at the hands of the farmers' clubs and others, so much so that there has been considerable talk of abolishing the office altogether. Just what the future holds in store remains to be seen, but it is a fair inference that nothing drastic will happen.

PRINCE HENRY TOUR UNDER PRECISE CONDITIONS

BERLIN, Feb. 1.—Rules for Prince Henry tour (1909), which is the event superseding the "Herkomer," will take place from the date of weighing in June 9, next, to the 19th of the same month, and it is interesting to note the manner in which freaks are debarred from the contest. The following rules, which will govern during the contest, were formulated by the Imperial Automobile Club, Berlin; Austrian Automobile Club, Vienna; Hungarian Automobile Club, Buda Pesth, and Bavarian Automobile Club, Munich, as the product of careful deliberation, having in view the fact that the contest is to be deprived of all racing tendencies, hence a reliability run under carefully devised rules, quite completely given as follows:

Open to four and six-cylinder vehicles, whose frames are placed over the axle, of from 7 to 28-horsepower, as calculated on the following basis:

$$P.S. = 0.007\, i\, d^{2.5} \sqrt{S^3}.$$

i = number of cylinders, d = bore, S = stroke, all in centimeters. *P.S.* being German for H.P. The cars must be at the close of the first list of entries in the possession and use of the entrants, all of whom must be members of internationally recognized or German affiliated clubs, or of Austrian motor clubs recognized by the Austrian Automobile Club. The cars must all be at least four-seated, with double side entrance and doors, have steps of full length, and must fulfill all the police regulations for street and traffic. They must all be fitted with two brakes acting independently of each other, exhaust, three lamps, of which the one must be attached to the rear in order to light up the Prince Henry number, reverse, hill climb drag and a single-toned signal. The cars must also be painted and varnished and have four mudguards of at least 200 millimeters breadth, measured horizontally to the length of the car. These may not be displaceable. The minimum measurements for the body are as follows: Breadth of the front seats, 1,140 mm.; breadth of the rear seats, 1,200 mm.; both measured from outward edge to outward edge of the body; height of the front seats, 750 mm.; height of the rear seats, 800 mm.; both measured from the middle of the motor over the upper edge of the frame, i.e., from the upper edge of the seats back to the upper edge of the chassis frame. The distance from the top back edge of the front seat to that of the rear seat, measured from the middle of the driver's seat, must be 1,100 millimeters. The back wall of the rear seats must be closed throughout. The lowest point of the chassis must be at least 150 mm. above the ground. All cars must be fitted with a speedometer, and no advertisement whatever may be attached to the vehicles.

The minimum total weight of the cars, expressed in kilograms, will be calculated according to the formula:

$$G\,k\,g = 147\sqrt[2]{P.S.} - 6.5 + 646.$$

The horsepower (P.S.) being the same as above. The weight will be calculated exclusive of spare tires, inner tubes, fuel (petrol, water, oil), with empty tool case, and with oil in the motor and gear. In order to render the weighing-in easier, the cars may come to the scales with oil, water and petrol in the reservoirs; this will be calculated at 60 kilograms per car. The minimum weight of the body has been fixed at 15 per cent. of the total for each car. The body, which must be made of wood or metal, comprises all mudguards and their fittings, steps and their attachments, toolbox on the steps with tools, luggage rack, lamps, single-toned signal and tire holder. No lightening of the weight may take place during the trial.

Only petrol (gasoline) of a specific gravity of .680 upwards, benzol, alcohol and petroleum and their mixtures may be used as fuel. All additions are strictly forbidden. All cars may be driven only by members of the above-mentioned corporations, who receive no recompense for their driving.

Entries must be made by the owner at the headquarters of the promoting clubs on a filled-out form, enclosing the fee of 500 marks ($125). This fee comprises the liability insurance for damages to persons up to 500,000 marks, with 100 per cent. for damages to goods up to 10,000 marks, with 90 per cent. as well as insurance of the cars against fire in the various garages during the whole tour. A factory certificate as to the cylinder dimensions must accompany the entries. Entries close on April 1, at 6 P.M. Entries at double fees are accepted until May 1, 6 P.M.

The tour takes place from June 10 to 18, with the weighing-in at Berlin on June 9. The route runs:

Thursday, June 10—Berlin-Breslau, first speed trial.
Friday, June 11—Breslau-Tatra Lomnicz, or Tatra Fiered.
Saturday, June 12—Tatra Lomnicz-Buda Pesth.
Sunday, June 13—Rest and exhibition.
Monday, June 14,—Buda Pesth-Vienna.
Tuesday, June 15—Rest and exhibition.
Wednesday, June 16—Vienna-Salzbury.
Thursday, June 17—Salzbury-Munich, second speed trial. Finish at Munich.

The start takes place once for all as fixed by the executive, the car with the biggest horsepower (No. 1) going off first. Every car will be accompanied by an official observer; every car must be occupied throughout by at least three grown-up persons, inclusive of the observer. During the speed trials the cars must carry four grown-up passengers, or 70 kilos of ballast in lieu of a fourth. The driver can hand the control of his car temporarily to his chauffeur, or a person nominated, before the commencement of the tour. This may not be longer than for two hours daily, if indisposition does not render a longer term necessary. The driver must steer his car personally in the speed trials.

All repairs may only be carried out by the driver, chauffeur or nominated passengers. Repairs during the time the vehicle is in motion are prohibited. All repairs also at the various daily garages may only be made with the material carried on the car. Transgression means disqualification, the only exception being the replenishing of tires and tubes. The awards will be made in points as follows:

Every commenced minute of an involuntary stay will be debited with two-tenth points. An involuntary stay is every stay during which a repair is made, the whole of the time being calculated from the stopping of the car to its continuing. Repairs of the speedometers may only be made at the various stations during the sixty minutes before the start given over to repairs and replenishments of fuel, oil and water. No debit points will be given for damages to speedometers.

Further, every commenced minute over the time allowed before the start for repairing will be debited two-tenth points; arriving late at the start from other causes than this will also be debited with two-tenths points. Tube defects from the garage to the start will not be reckoned. Changing of tires, as well as repairs or mending of tires, will only be punishable with one-tenth points each, regardless of time. Every alteration of the tires, especially fitting of enclosures or bandages, will be looked upon as a repair. Every change of the detachable rims will be debited with one-tenth point. Tube changes will not be reckoned. Replenishments of cooling and brake water after the start will be debited with five-tenth points each time. Fuel and oil necessary for the day must be carried in the car in extra tanks, as no official petrol and lunch stations will be available. Lubrication of the driving chain is, excepting the automatic working, only permitted once during the day; further lubrication of the driving chains, as well as of the motor and car—excepting through fitted tubes—is forbidden during the day; transgression will be punished with one-tenth of a point.

Two speed trials take place on the level during the tour. These will be calculated on a basis not yet published in such wise, that each car, according to whether it exceeds the speed fixed for it as normal or not, receives for every commenced one-tenth per cent. in the first trial one-hundredth point, and in the second speed trial two-hundredths point in credit or debit marks. The three credit points mentioned above will not be taken into consideration in the awards for the special speed prizes. Special provision is made in case of a "draw."

INTERNATIONAL AERONAUTICAL EXPOSITION ASSURED

PARIS, Feb. 3.—There will doubtless be an international aeronautical exposition in Paris during the year 1910, with the French Government as its backer and promoter. The initiative in the matter has been taken by the Ministry of Public Works which, with Minister Leon Barthou at its head, has shown considerable enthusiasm for aerial navigation, and has already succeeded in obtaining a Government subvention of $20,000 for the encouragement of flying.

At an early meeting of Parliament the following resolution will be brought forward to be voted upon: "The Chamber of Deputies invites the Government to organize a national and international exhibition of aerial locomotion in all its forms during the year 1910." If, as is very generally believed, the resolution meets with the approval of Parliament, work will be begun at once on preparations for the first exhibition the world has ever seen in which aerial vessels occupied all the space.

The Esplanade des Invalides, on which the last two commercial motor shows were held, and which was the scene of a portion of the 1900 World's Fair, has been seized upon as a suitable site. For an indoor exhibition only the position is doubtless perfect, for it is but two minutes from the Champs Elysees, and as conveniently reached from all parts of Paris as is the lower end of Central Park from different portions of New York City. To give the exposition its full measure of interest, it will be necessary, however, to provide for open-air experiments by aeroplanes and dirigible balloons, and for this purpose the Invalides is not ideal.

Issy-les-Moulineaux, which is just on the city borders, would give all the space necessary for flying, and as the Galerie des Machines has to be pulled down this year it is suggested that it should be transplanted to this ground in preparation for the aeronautical exposition. The hall is the largest in the world, there being sufficient space under its vast glass roof to house a score full-sized dirigibles and more than a hundred aeroplanes. An alternative site can be found at Bagatelle, on the borders of the Bois de Boulogne, and a few minutes from Longchamps racecourse, where Santos-Dumont made the first public flight in Europe, and where Delagrange, Bleriot and other pioneers first learned to fly. The setting is a pretty one; the area is sufficient to allow of the construction of the necessary hall, while leaving all the space required for starting dirigible balloons and aeroplanes for demonstration flights and competitions. The only objection at present is that means of transport are somewhat limited. The choice of a ground, however, will be one of the least of the difficulties that the Government will have to meet, there being in addition to these three positions, several others which many cities would consider adequate for the circumstances.

NATIONAL BALLOON RACE STARTS, INDIANAPOLIS, JUNE 5

WITH the breaking up of Winter in this country the Aero Club of America is looking forward to a greatly renewed activity among the American aspirants for aerial honors. A long list of prizes has been announced, which will be competed for under the auspices of the club, some of the more prominent are: the President's Prize, consisting of $1,000; the "Scientific American" Trophy; The Michelin Prize of $4,000, The Gordon Bennet Aviation Cup, the Fulton Flight Contest for $10,000, and the National Balloon Race. The Fulton Contest for the New York "World" Prize will take place during the Hudson Fulton Celebration, and it is hoped that it will be the forerunner of many similar prizes offered in the future under the auspices of the Aero Club.

The national balloon race will start from Indianapolis, Ind., on Saturday, June 5, according to an announcement recently made by the president of the Aero Club. The details will be managed by the Indiana Aero Club, which has just been organized and has applied for affiliation with the Aero Club of America. The entry fee is $25, which will be returned to all who start. The contestants are limited to official pilots of the club, of which there are now 17, but before the entries close, on May 1, this number will undoubtedly be increased. The prize will be a gold cup valued at $1,000, and additional prizes will probably be offered for the second and third men. Under the international rules the contest is limited to balloons of a maximum capacity of 77,000 cubic feet.

At the recent meeting of the directors, Cortlandt F. Bishop was re-elected president of the club, and arrangements for the third annual banquet, to take place in March, were rushed under way. By that time it is hoped that the fund for the medals to be given to the Wright Brothers in recognition of their services to the cause of aviation, will be completed and the time for presentation determined upon. Thus will the activities partake of interesting variations on a broadening basis.

Y. M. C. A TO START AERONAUTIC SCHOOL.

The West Side Y. M. C. A., of New York City, is making plans for an experimental course in aero science, beginning February 15, and if sufficient interest is aroused in the subject the association will open in the Fall of 1909, or possibly earlier, a school to train men for positions as aerial chauffeurs and engineers. The experiment will take the form of a series of free lectures on aeronautics by well-known aeronauts. The first lecturer will be Winthrop M. Scarritt, member of the Aero Club and former president of the A. C. A. He will speak on "The Experiences of a Tenderfoot in the Clouds." On March 1 Augustus Post, of the Aero Club, will speak on "The Practical Side of Aeronautics," and on March 8 Wilbur R. Kimball will discuss "the Practicability of Flight." Taking things as a whole it is plain to be seen that aerial navigation has taken a hold on the public and from all accounts there will be more than spectators as the product of the interest displayed. Recruits should enlist in the service, which has already rewarded the most daring of the aeronautic students so mightily.

AERONAUTIC SOCIETY CHOOSES OFFICERS.

At the annual meeting of the Aeronautical Society, held in the rooms of the Automobile Club of America, plans were discussed for the coming contests at Morris Park race track grounds, to be held some time in May. The following officers were elected for 1909: President, Lee S. Burridge; vice-presidents, Louis R. Adams, William J. Hammer, and Roger B. Whitman; secretary, Wilbur R. Kimball; treasurer, Dr. William Green; directors, Orrel A. Parker, C. B. Levy, Ernest La Rue Jones, A. C. Triaca, Riley B. Scott and Dr. Julian P. Thomas.

NEXT BRITISH AERONAUTIC EXHIBITION.

LONDON, Feb. 6.—The Society of Motor Manufacturers and Traders, in conjunction with the Aero Club, will hold an aeronautic exhibition at Olympia from March 19 to 27. Aeroplanes or models will be given space free of charge, and sufficient entries have been received already to insure a successful and interesting show.

COMBINED EFFORT IN THE MIDDLE WEST.

Automobile activity in the West is now centered in the Chicago show, which opened under the most favorable auspices, illustrating again the fact that "in union there is strength." Never before, in the history of trackless mechanical transportation, did so many cars mass under one roof, there to proclaim to all the world the fact that the automobile is a power in the land. Nor can it be said that even veterans fully realized just what it meant to assemble the makes of cars which go to represent the industry which compelled the exchange of $467,000,000 within a single year—the last year, to be sure.

In the year to come it is variously estimated that some 80,000 automobiles will be sent out as the agents of the industry; out into the world, in which they must show worth in a manner as never before, and it is well worth risking the prediction, in effect, that these same cars will proclaim in sonorous voice that dreams do come true, and the echo which took seed in the Chicago show will come back within a year with augmented results.

* * *

TAKING INTO ACCOUNT THE MATERIALS.

Static ability was once the main criterion rather with the idea that kinetic properties could be reflected to an adequate extent. Kinetic requirements proved the undoing of the earlier theory with the result that the hunt for materials of a kinetic character has been strenuous, uninterrupted, and through divers channels. From the old methods of reflecting kinetic qualities to alloy steel, in the search for materials pronouncedly superior in "diagonal" work, was a long way, midst thorns bearing the scent of roses, due to the mode of procedure in which "the wish was father to the thought."

The thought was that price was a good indication of quality, and the makers of the materials were perfectly willing to allow the same thought to propagate and spread to the remotest corners, and to swell the "tide." That the scheme will not hold water is rendered apparent from the fact that the best results come from the use of "cementing" steel in which carbon is low—very low indeed; alloying if rigidity is to be intensified; holding to the plan in which kinetic ability is foremost, in any event.

Recent investigations disclosed the glaring fact that none of the "impact" tests in vogue tell the truth, the whole truth, and nothing but the truth; they do disclose the important fact that with increasing carbon impact ability decreases. This is a discovery of such great importance that it should be "branded" in the memory of designers with a "hot iron," particularly in view of the fact that lowering the carbon in the steel increases the melting temperature of the same, and the furnace linings last for a length of time far less, thus accounting for the "influences" in favor of steel with a carbon content above the best requirement. That the carbon content should hold below the point at which hardness will follow quenching from cementing temperatures is assured, for then the core of a cemented section will be ductile, and dynamic, while the surface will be rendered hard as glass, due to cementation, in which carbon abounds in the surface layer sufficiently to deprive the steel of the ferrite excess; interjecting cementite instead, which later condition affords assurance of glass-hardness on the surface while the soft core lends stability to the project as a whole.

* * *

WHAT PROPORTION SHOULD THE BODY BE?

Among the rules formulated for the running of the Prince Henry tour this year is to be found one imposing a minimum weight on the body to be used. When the impossible freaks of construction that passed as touring cars in last year's event are recalled, the reason for the rule will be evident. This new rule stipulates that the body must represent at least 15 per cent. of the total weight of the machine, and it raises a question of general interest. Without attempting to fathom the processes by which this arbitrary limitation was fixed, let us see what 15 per cent means. In the case of the light touring car that weighs but 2,500 pounds, all on, this would call for 375 pounds of body. Take a 60-horsepower machine exceeding 4,000 pounds, and practically none of that power falls below this figure with a touring body, it would mean that at least 600 pounds of the total would have to reside in the body. Whether it be possible to carry out such a limitation as this and make it equitable in practice where the entries comprise a diversity of types, ranging from small and light powered cars up to the heaviest machines, remains to be seen.

$1,000,000 SUBSCRIBED FOR THE MOTOR PARKWAY

NEW capital to the extent of $1,000,000 has been placed at the disposal of the treasury of the Long Island Motor Parkway during the past week. Four of the best known financial magnates in the United States have subscribed for bonds to the above amount, and the money is now available, to be used in the resumption of construction work on the Parkway as soon as the frost is out of the ground. Three of the four men who have showed their confidence in the project in such a substantial manner are J. Pierrepont Morgan, William K. Vanderbilt, Sr., and H. B. Hollins, of the Wall street banking house of H. B. Hollins & Co. The bonds draw four per cent. interest, and are issued as an addition to the former issue of $500,000.

The officials of the Parkway have decided to change the route of the course so that it will now terminate on the northern shore on Long Island, within half a mile of Little Neck station. The right of way has been secured, and the change, besides doing away with the numerous grade crossings, called for on the original route, will bring the Parkway into direct communication with the new Blackwell's Island bridge, which has a special roadway for automobiles.

The completion of the work, which is now insured by the new capital, will prove of great value both to the individual automobilist and to the trade, and the well wishers of the enterprise will be glad to know that the project will soon take shape.

COBE OFFERS CUP FOR WESTERN ROAD RACE

CHICAGO, Feb. 9.—Ira M. Cobe, president of the Chicago Automobile Club, has tendered to the American Automobile Association a trophy to be contested for annually in a national stock chassis road race. Mr. Cobe announced his gift at the annual banquet of the Chicago Automobile Trade Association in the course of his speech on "Road Racing in the West," in which he declared that the West is no longer a way station, but has become an important factor in things motoring. The trophy was given at the suggestion of President Hotchkiss, of the A. A. A. No formal announcement has yet been made of its acceptance by the national association, on account of a slight mistake in the deed of gift.

At first Mr. Cobe wished it to be a strictly Western proposition, while the A. A. A. desired to distribute its favors by holding the race in a different section of the country each year. As matters stand now, it has been agreed that the trophy shall be contested for in the West for the first two years on a course within fifty miles of Chicago. The Chicago Automobile Club has a suitable course in mind and has taken the preliminary steps toward securing it. The Governor of Indiana will be asked to permit the use of the militia to guard the course.

The proposed circuit is within fifty miles of Chicago and can be reached by automobile over fine roads, most of which are macadam. Crown Point, a town in Lake County of considerable importance, is on the course, and there are excellent railroad facilities for transporting spectators. There is only one other town on the circuit—Lowell, a village of about 1,000 inhabitants. Here it will be necessary to establish a control; otherwise, there are few flaws to be found. There are no railroad crossings; on the back stretch a ten-mile straightaway will permit high speeds. The course is approximately 22 miles long, and although there are a few bad turns, fast time can be made on the stretches.

Before the echo of Mr. Cobe's speech had died away, N. H. Van Sicklen, the new Chicago branch manager of the Knox, made the first tentative entry. It is his intention to put in either a 40 or a 50-horsepower model, whichever will be eligible under the rules adopted for the contest. Western manufacturers are showing a keen interest in the proposed race, and it is believed that if the race is run here in Indiana there will be little difficulty in securing twenty-five or thirty entries, not only from Western makers but from those of the East as well.

NO RACE THIS YEAR IN ITALY.

PARIS, Feb. 3.—There will be no racing cars this year on the fast Bologna course, where last September Felice Nazarro put up a new world's record for long-distance speeding. As the result of the decision of the Automobile Club of France to kill the Grand Prix, it is impossible for the Italian body to get entries for a race under similar rules, and the inevitable course has been taken of postponing the speed event until 1910. There are hopes of being able to get on foot an aeronautical demonstration with $20,000 in prizes, but at the present time there are more prizes than flyers, and it is doubtful if the Italians can fill their entry list sufficient to justify the holding of the event.

Belgium, which was to have held a race this year under Grand Prix rules, has not yet announced its decision, but it is understood that as the result of the combine by French makers against speed events there will be no attempt to carry the programme through. High-powered automobile speeding is therefore dead throughout Europe for the year 1909.

SAVANNAH WANTS MORE AUTO RACES.

SAVANNAH, GA., Feb. 8.—At a meeting held by the Savannah Automobile Club and the officers of the militia it was decided that Savannah would put in a bid for the next Grand Prize or for any other large race which may be in prospect. The military has promised to lend its aid again, and with the remembrance of its excellent work Savannah expects to make a strong showing.

HOTCHKISS FOR INSURANCE COMMISSIONER.

ALBANY, N. Y., Feb. 9.—The latest news from the executive mansion chronicles the appointment by Governor Hughes of William H. Hotchkiss, of Buffalo, for State Superintendent of Insurance. This appointment was sent to the Senate on Monday and was referred to the proper committee, which will act upon it at an early date. The interest of the automobile world in this appointment lies in the fact that Mr. Hotchkiss is president of the American Automobile Association, past president of the New York State Automobile Association and of the Automobile Club of Buffalo. He is also author of the motor vehicle law of the State of New York, which has been copied by other States.

Mr. Hotchkiss has signified his intention of accepting the appointment, which came to him unsolicited as a result of a long personal friendship with the Governor.

PARKWAY RELEASED FROM BONDS.

MINEOLA, L. I., Feb. 8. —Upon the payment to-day of $10,000 following closely upon a recent payment of $5,000, the Motor Parkway Company was released by the Nassau County Board of Supervisors from its $25,000 bond. This was put up before the sweepstakes and Vanderbilt Cup races last fall as a liability fund to insure payment for damages to roads or for any accidents. The small payment covered the expense of the deputy sheriff who guarded the road, while the large amount to-day is to defray the cost of oiling the roads and other expenses incurred.

NATIONAL ROADS BILL THAT APPROPRIATES $50,000,000

WASHINGTON, D. C., Feb. 6.—A number of good roads bills have been introduced in Congress during the past few weeks, but one of the most interesting is that of Representative Sturgiss, which provides for the creation of a national highways commission and for the construction, improvement and maintenance of public highways, in co-operation with the several States.

The proposed commission is to consist of three commissioners, to be appointed by the President of the United States, and they shall have a practical knowledge of road building and construction. They shall serve for a term of six years each. It will be the duty of the proposed commission to take into consideration, formulate and adopt such plans for the improvement, construction and maintenance of such public highways as shall promote and facilitate interstate commerce and the postal service.

The commission is empowered to institute condemnation proceedings for the acquirement of any land, right of way, or material needed to maintain, operate and prosecute highway improvements.

The bill carries with it an appropriation of $50,000,000 for the purpose of carrying out its provisions. The sum of not less than $500,000 out of such appropriation shall be expended in each State at the rate of not less than $100,000 a year. The $50,000,000 appropriation shall be available at the rate of $10,000,000 a year during the years 1909 to 1913, inclusive. However, no part of this appropriation shall be expended in any State until an equal sum of money shall be appropriated and set apart by said State for highway improvement. Authority is given the Secretary of War to detail an engineer officer of the army to aid the commission in its work.

VANDERBILT CUP COMMISSION SUED.

NEW YORK CITY, Feb. 8.—Jefferson deMont Thompson, chairman, and Frank G. Webb, vice-chairman, of the Vanderbilt Cup Commission were served on February 5 with a summons in an action to recover $500, representing part payment on account of the entrance fee paid to the Vanderbilt Cup Commission by the Mora Motor Car Company, of Newark, N. Y. Senator William W. Armstrong, attorney for the plaintiff, has made all the members of the Vanderbilt Commission parties defendant to the suit, although the two mentioned were the only ones served.

Speaking of this suit, W. W. Burke, manager of the Mora New York branch, said: "When the entry blanks were issued for the 1908 Vanderbilt Cup race, the first entry was made by the Mora Motor Car Company, in the belief that the race would be an international one, as in previous years. The company sent its check for $500, being part payment of the fee of $1,000, specified for each starter. Then came the clash with the A. C. A., and for a time it looked as if the race would be abandoned, owing to the Cup Commission not adopting the rules formulated by the Congress of European Automobile Clubs. Under this uncertain atmosphere the Mora Motor Car Company decided not to go ahead with their special racing car, and demanded the return of their $500."

Referring to the other side of the matter, Mr. Thompson says the suit will be contested on the ground that all conditions for the race were fulfilled by the commission. "We received the entry from the Mora company on May 25," said Mr. Thompson. "The entry was treated seriously and arrangements were made with the Mora as a prospective starter. It was not until September 24 that we were notified that the company had not been able to finish the car and desired to withdraw. Very naturally the commission declined to return the money. The proviso that half the fee must accompany the entry and would be forfeited in the failure to take part in the race was made to prevent just such happenings. Were we to have made conditions that did not include early payment of part of the entry fee, we would have been flooded with entries from concerns that had no intention of competing and desirous simply of obtaining what prestige might accrue to prospective contestants."

CONNECTICUT ENDURANCE RUN THIS SPRING.

HARTFORD, CONN., Feb. 8.—At the last meeting of the Automobile Club of Hartford it was voted to hold an endurance run in May, and although the time is yet quite distant plans for the event are already being made out. Several routes have been suggested. One that seems feasible is from Hartford, through New London, Providence and Worcester and return by way of Springfield. The dealers are said to favor a run of about three hundred miles, to be covered in one day.

FIVE NEW BILLS PROPOSED IN NEW YORK.

ALBANY, N. Y., Feb. 6.—Five bills amending the present New York automobile laws have been introduced by Assemblyman Robinson at the request of the law committee of the Automobile Club of America. The first deals with the exemption of owners licensed in another State. As the law now stands, a New Yorker may take out a New Jersey license and not register at all in New York, with considerable pecuniary saving to himself and a corresponding loss to the New York treasury. The amendment would confine the exemption to non-resident owners.

Another bill would abolish speed limits of a specific number of miles an hour, and instead make everybody on the highways responsible for the maintenance of a rate of speed reasonable and proper under the circumstances. It is modeled on the law at present so satisfactory in Connecticut. All fines and penalties are to be paid over to the Secretary of State to be used for the maintenance of the roads. Local magistrates will be compelled to account for fines and to turn them into the treasury, instead of putting them into their own pockets. The Penal Code is amended by providing that taking out automobiles without the consent of the owner—"joy-riding," to use the vernacular—shall be considered larceny, and making any tampering with an automobile without the consent of the owner a misdemeanor. That some such laws will pass looks like a certainty, the wisdom of which is reflected in the experiences of the past, more particularly in view of the splendid results which followed the adoption of sane laws in other states; notably Connecticut.

ANOTHER EFFORT AT FEDERAL REGISTRATION.

WASHINGTON, D. C., Feb. 8.—Representative Olcott, of New York, has jumped into the limelight by introducing a bill in Congress regulating the operation of motor vehicles within the District of Columbia and the territories of the United States and while regularly engaged in interstate or foreign commerce or the postal service. It is understood the A. C. A. is behind the bill.

Regarding registration, the bill provides that no person shall, after 90 days following the day on which the proposed law takes effect, operate any motor vehicle unless it shall have been registered by filing with the Secretary of Commerce and Labor at Washington, D. C., a statement containing the name and address of such owner, a brief description of the machine, including the name of the maker, the number affixed by the maker, the style of the car, the character of the motive power, and the horsepower of the car. A filing fee of $2 is required.

A motor car manufacturer or dealer may register one vehicle of each style or type manufactured or dealt in.

It should be understood that this proposed law has no chance whatever of securing any attention during the present session of Congress.

CHIT-CHAT FROM THE CLUB CENTERS

LONG ISLAND A. C. PREPARED FOR BUSY SEASON.

BROOKLYN, N. Y., Feb. 8.—At a special meeting of the board of governors, held recently, the president of the Long Island Automobile Club appointed the following committees: Law and legislation, Wm. Payson Richardson, chairman; Hon. Eugene M. Travis, Charles C. Cluff, A. A. Hovell and Herbert G. Andrews; entertainment, Edwin Melvin, chairman, W. C. Colson and Louis T. Weiss; technical, Louis T. Weiss, chairman, and F. G. Jahn; membership, Allen C. Alderman, chairman, W. L. Webster and Wm. G. Morrisey; contest, A. R. Pardington, chairman; auditing, J. H. Emanuel, Jr., chairman, W. H. Caldwell and W. L. Webster; garage, Wm. Schimpf, Frank G. Webb, Herbert G. Andrews, Charles C. Cluff and W. H. Caldwell; good roads, Charles Jerome Edwards, chairman, Cleveland Litchfield and Robert Magaw. Wm. Payson Richardson was nominated as the club's representative to the New York State Automobile Association.

These appointees are all well-known enthusiasts identified with the club, but probably the greatest achievement in the history of the club was the passage of the Cypress Hills Cemetery bill, authorizing a parkway from King's to Queen's county. This work was done by the law and legislation committee, under the guidance of Mr. Richardson, who is reappointed in recognition of the good work of the past year.

BRIDGEPORT CLUB IN FLOURISHING CONDITION.

BRIDGEPORT, CONN., Feb. 8.—As a result of the campaign instituted by President Sperry, of the Automobile Club of Bridgeport, to not only increase the present membership but to arouse interest among many of the present members, the recent meeting of the board of directors marked the increasing of the roll by 50 new names. This brings the total up to about 225 with brilliant prospects of passing the 300 mark during the summer season.

As indicative of the renewed life infused into some of the members, over 200 with their friends were present at the smoker given at The Stratfield. The program, consisting of moving pictures of the Savannah and Briarcliff races, some vaudeville stunts by artists from Poole's Theater and a buffet lunch served by the hotel management. Arrangements have been made with the management of this new hotel to hold club meetings there.

At the last meeting of the board of governors, chairman Ralph M. Sperry of the contest committee was authorized to begin preparations for the four annual hill climb to be held on the morning of Decoration Day. The place has not yet been definitely decided upon, but it will be either Sport Hill in Easton or Snake Hill in Mill Plain.

PROPOSED MOTOR CLUB MAKES HEADWAY.

BOSTON, Feb. 8.—Last week when the tentative meeting of prominent members of the automobile fraternity was held with the idea of advancing the proposed new organization, L. R. Speare, president of the Bay State Automobile Club, clearly depicted the fact that just the facilities which the new organization would have to provide awaited but fitting use under conditions involving that strength which unity always signifies, and he further stated that if the present officers of the club fell under the ban, they would gladly make way for agreeable successors. The meeting of the charter members of the new organization, comprising some 50 prominent names, fell in with the plan as suggested by F. S. Corlew and the name of the new organization is to be the Boston Motor Club. The committee on rules and by-laws was appointed and is made up of W. A. Thibodeau, chairman; C. E. Fay, J. B. Sullivan, Jr., F. S. Corlew and Arthur P. Teel. The committee on club quarters was named, and consists of W. A. Shafer, chairman; F. H. Ayres and R. R. Ross.

QUAKER CITY AUTOISTS HAVE ELECTION.

PHILADELPHIA, Feb. 8.—The annual election of the Quaker City Motor Club last Tuesday night was the closest in the history of that hustling organization. After a stirring campaign the present president, P. D. Folwell, was beaten out for re-election, by a small margin, by L. D. Berger. The new president is also the presiding genius of the Motor Shop, which formerly handled the Stearns and Oldsmobile, the latter car, however, now being represented here through a branch house. M. E. Brigham for first vice-president; G. Douglass Bartlett for second vice-president; A. T. Stewart for treasurer, and Harry C. Harbach for secretary, were unopposed. There was a counterpart of the presidential contest in the fight for places on the board of directors, of the twenty-six nominees the following being elected: Fred C. Dunlap, R. E. Ross, G. H. Gantert, J. R. Overpeck, W. D. Donnelly, E. H. Lewis, Richard Sellers, A. T. James, and Max R. Greene.

After the pools closed at 8 o'clock there was a stag smoker and luncheon in the banquet hall. The majority of the out-of-town tradesmen and lay visitors who were in town to attend the automobile show were among the numerous guests.

Rumors have been prevalent hereabouts for the past fortnight that a sizeable clique in the club were not satisfied with its management, claiming that the trade element, being in entire control, subordinated the social features to the advancement of their own particular ends. At the same time the publicity committee of the Century Club, which was formerly the Century Wheelmen, the crack local organization during the cycling boom days, began to ring the changes on their intention of transforming their organization, which is now strictly a social club, into an automobile club. While no open defection has as yet materialized, the Q. C. M. C. officials have thought the matter sufficiently serious to come out in a statement denying the rumor and challenging the production of the list of members (said to be 35 in number) who were contemplating resigning.

The rumor, even if unfounded, will in all likelihood make the Quakers bestir themselves and take the initial steps toward establishing a home of their own.

NORRISTOWN CLUB'S SECOND ANNUAL RUN.

NORRISTOWN, PA., Feb. 8.—The second annual endurance run of the Norristown Automobile Club will take place on dates yet to be selected in the latter part of April. It will be a two-day affair, and although no objective point has been positively decided upon, it is almost certain that Sunbury will be selected. This would make a round trip of about 300 miles. While the roundabout route via Harrisburg would furnish the better going, that by way of Shamokin is more direct. A compromise may be effected by going one route and returning by way of the other.

At last week's meeting the following officers were placed in nomination: President, John H. Rex; vice-president, Isaac M. Smith; treasurer, Lewis E. Taubel; secretary, William B. Hart; assistant secretary, Earl Wentz.

GERMANTOWN A. C. HOLDS ANNUAL BANQUET.

PHILADELPHIA, Feb. 8.—One hundred and four members and guests sat down at the annual banquet of the Automobile Club of Germantown last Saturday night. Bright lights in professional and business life, besides many prominent automobilists, were present. President Robert P. Hooper acted as toastmaster, and among those who responded to toasts were E. T. Stotesbury, Senator D. Webster Grim, of Bucks county; Senator William C. Sproul, of Chester; Charles T. Terry and F. H. Elliott, representing the A. A. A.; Paul C. Wolff, of Pittsburg; Powell Evans, president, and F. Boyer Davis, secretary, of the Automobile Club of Philadelphia; W. N. Glasgow, L. P. Wright, Harrison Townsend and James F. Hope.

SKY WARS SEEN THROUGH MAXIM'S EYES.

Hudson Maxim, in a well-put talk, at the Automobile Club of America, New York City, delivered on the night of February 9, made the point that Congress should appropriate $5,000,000 for "aeronautics" instead of balking at a paltry $500,000. It was "aeronautic night" at the A. C. A. and the meeting developed wide interest, which was of a character to indicate that the world is moving faster than Congress seems to appreciate, and as Hudson Maxim aptly put it: "Congressmen look upon the United States as a sort of a big raft bound to float along in the current of prosperity somehow." But the climax of Mr. Maxim's keenness lent zest to the whole discussion when he said, "they (Congress) believe that one's interest, like charity, should begin at home, and thus it is that we have more real statecraft than we have statecraft."

Representative Butler Ames, of Massachusetts, whose work in the aeronautical line has attracted wide attention, in his reply to Mr. Maxim, said: "All that has been said about the necessity for making preparation in this country for meeting the fleets from the skies is true, but as a member of Congress I am not willing yet to say that we shall not have an appropriation this year. There is still a chance in the Senate, and I hope and believe that before the session ends we shall have the full appropriation and in future years much more."

MAXWELL GETS NEW FACTORY AT TARRYTOWN.

Tarrytown, N. Y., Feb. 8.—Rumor has been current several weeks that the Maxwell-Briscoe Motor Company, of this city, has been trying to get control of the Ingersoll-Rand-Drill works here. Official confirmation of the report comes from Secretary F. D. Dorman, of the Maxwell-Briscoe Motor Company, who, when asked in regard to the facts, said: "Yes, it is true we have leased the Rand Drill Works to take care of our overflow. Our business has grown so fast that we have utilized nearly all of our available space, and it was impossible to put up new buildings on the premises fast enough. We will take possession immediately.

Locally, the acquisition of the drill works is considered a great thing for Tarrytown. As the Maxwell-Briscoe people employ about 1,000 men at Tarrytown alone, with a pay roll averaging $12,000 weekly, this is simply another step in the company's policy of expansion, which adds additional factory space to the present chain of three factories. For 1909, the combined output of the Maxwell factories will approximate 12,000 cars. For 1910, with the increased facilities just obtained, the present plans call for an output of about 20,000 Maxwells. Superintendent Pretz has already started a gang of men at work in the new building, which is proof of how sorely the additional space was needed.

NEW JERSEY LICENSES TRANSFERABLE.

Trenton, N. J., Feb. 8.—As the result of an application by A. B. LeMassena, local agent of the Department of Motor Vehicles of New Jersey, at Newark, regarding the legality of transferring a number pad from a car which had been in its owner's possession but a day or two, and had never been used, to another machine, subsequently acquired, Commissioner J. B. R. Smith has made a general ruling which reverses his former stand on this point. Hitherto, Commissioner Smith has held that a license, when once issued, should not be transferred from the car to which it was originally given. If an owner sold his car he could also sell his license, the transfer being validated by the payment of a fee of $1 to any State auto agent, this construction being put upon the Jersey law immediately following its adoption in 1907. Under the new ruling, upon payment of a transfer fee of $1, it will be possible to use the old license pad upon the newly acquired machine. Commissioner Smith has devised a special form of transfer card, with which the agencies are being supplied as fast as the State printers can turn them out. These call for practically the same information.

FRANKLINS WILL DO SERVICE IN PITTSBURGH.

Taxicab service is of a character such as to demand the consideration of designers to an extent far in excess of that usual to automobiles in general, for the reason that the service is continuous, on streets of every character, under the charge of chauffeurs of no great skill. The cars must stand in the street, in the cold of winter, for hours at a time, and economy of fuel as well as maintenance of machinery indicates that the motor should be brought to rest whenever possible.

If air-cooling is taken advantage of, it is then that the cold weather is more of an aid than a detriment; at all events the weather will not effect the service which can be rendered, and the cost of upkeep of the machinery will be lowered since the life of a machine can be counted in revolutions of the rotative members of the same. True, the thermal efficiency of a motor is dependent upon a dozen of considerations, and again, the life of the same is not so low that counting the revolutions of the rotative members becomes as a necessity. Even so, it is desirable to count all the influences and eliminate as many as possible of the negative quantities.

It will come as no surprise then to learn that the "Franklin" air-cooled motor is to be used at Pittsburgh; a location demanding every consideration from the point of view of inclement

Franklin Air-Cooled Straight Front Landaulet.

weather, to say nothing of the steep ascents and in divers ways; roads which demand more than a little consideration at the hands of designers of automobiles to be used in that locality. The illustration here afforded is of the new Franklin taxicab as it will be used at Pittsburgh, twenty of which are to be put into service next month.

The body of the cab is of the "landaulet" type; the top folds back, and in every way the design favors stability coupled with style and an inviting air. The exterior finish is in Quaker green, and the interior is in dust-proof light cloth and leather. The chauffeur's seat is in green leather, and by way of some contrast the green of the body is relieved by molding and underbody work in black.

The chassis frame is of laminated wood (usual Franklin practice), noted for its strength, lightness, and the fact that resiliency is present in the frame to a marked extent. This is a question which may not be quite well understood by many on the ground that wood is not so much used in automobile work, and in the earlier days, when laminating was not resorted to the defects of the wood were to be feared. In the Franklin plan (in which the frame is laminated) the well-known qualities of wood can be taken advantage of without in the least fearing that a defect in the wood will develop to the detriment of the car. In other ways the new car is on a basis which is bound to make the record of performance in Pittsburgh an epoch-making event.

The air-cooled motor is of the well-known Franklin make, using "concentric valves," and the usual Franklin means of wiping away the heat, water or other liquids failing to play a part.

News in General

Mrs. J. W. Gogarn In Her Boon Companion Reo Model G.

The owner has driven this car over 3,000 miles over the roughest roads, and finished "perfect" in the late "Long Island Mechanical Efficiency" wrangle. Mrs. V. V. Board, Mrs. G. G. Williams, and Mrs. E. J. Kincaid make up the rest of the "winter scene" on this occasion.

Michelin's Views on the Care of Tires.—A very large proportion of autoists habitually carry spare shoes with them, or at least have one or two spare shoes in their locker at the garage. In speaking of the care of shoes, M. Michelin says: "A casing which is not in use must be carefully kept away from light and heat. It is preferable to keep it in a place which is cool, without being damp, as dampness is bad for rubber casings, even for those which are being used, although they are less sensitive to light and heat than tires kept in one place. Spare shoes should never be permitted to lie on the ground, or on cement floor, but should be protected by a curtain and must be carefully kept away from any fat substance. Casings in use require more care, as the shoe is constantly receiving numerous small cuts from its contact with the ground. These are sometimes almost invisible and others are large enough for the driver to see, but so small as to be neglected. They open the door to dampness and foreign bodies, which are certain to injure the tire. Dampness rots the lining and invites blowouts, which are also caused by dust being forced through a slight cut in the tire or by the entrance of small particles of ground which become bunched together beneath the outer rubber. The result is the accumulation of a hard body which cuts one ply of fabric after another until the casing explodes. It is, therefore, necessary to pay close attention to these cuts, and in case of Michelin tires to cure them with Michelin Mastic. This closes up many cuts which would otherwise become serious wounds, and a little attention of this sort will lengthen their life very materially, and will procure a length of tire life which will surprise the owner.

Pierce School Plans for 1909.—Announcement has been made to all dealers in Pierce Arrow cars of the plans for the 1909 school of instruction conducted by the Pierce Arrow Motor Car Company, of Buffalo. The plans for the present year are far more comprehensive than any the company has made heretofore, and include not only classes for chauffeurs and garage men, but also a special period during May for owners exclusively and one during April for colored men. The classes begin February 15 and each one lasts two weeks. Expert mechanics are in charge of the work of instruction, which consists of detail lessons regarding the car, its assembly, maintenance and driving. The time between May 3 and May 22 has been set aside for the instruction of owners who intend to drive their own cars, and the work of the instructors during that time will be devoted entirely to them. The class of colored men will open on April 5 and close April 17, and during that period the school work will be for them altogether.

National After 10,000-Mile Record.—Early in May or June the National Motor Vehicle Company, of Indianapolis, Ind., will go after a record, which is nothing more or less than an attempt to do 1,000 miles every day for ten consecutive days. This trial will be made possible by the new two-mile motor speedway track, which has been promised for completion early in May. The trial will be made with a single car, of course, and will be under official observation. The grind will go night and day for 240 hours, with tire repairs or repairs of any kind to be made in running time. The National people feel fairly confident of reaching the record of 10,000 miles in ten days, since some years ago they made a world's record of 1,094 3-16 miles in 24 hours. If the effort is successful, it will certainly be a striking demonstration of the sturdiness of the car, for this would mean the terrific clip of 50 or more miles per hour kept up for 10,000 miles. Four different crews will be used in relays for the trial.

"Grease vs. Oil."—An attractive brochure is printed by the Keystone Lubricating Company, Philadelphia, bearing the above title and containing instructive comparisons of the efficiency of the two great types of lubricant that are used to grease the wheels of industry. Some of the inner reasons for the extensive use of the liquid lubricant, oil, at the present day, are interestingly explained; and the evolution of Keystone grease, stated to be a pure, natural product, free from the harmful ingredients and objectionable features, are convincingly set forth. A feature of the argument for Keystone grease as an ideal lubricant at minimum first cost and operating cost, is an account of exhaustive tests made by the head chemist of William Cramp & Sons, the Philadelphia shipbuilders, on the chemical constitution and mechanical and anti-friction qualities of the product. This booklet, of which many thousands have been printed and distributed, may be obtained gratis on application to the home office of the company, or to any of its agencies.

Wonderful Tire Mileage.—As a slight indication of the wonderful increase in tire building, is cited the case of an Indiana autoist, who in a roadster got a wonderful mileage out of his tires. Forty thousand eight hundred and seventy-two miles on one set of tires with no trouble beyond two punctures, is the record claimed by J. L. Martin, of Fowler, Ind. They are the largest figures for a single set of its product ever reported to the Diamond Rubber Company, but analysis appears to verify them. Looking into the matter brought out the fact that Mr. Martin made the mileage reported within a period of 18 months, according to the record kept by a reliable speedometer. The owner, being in the windmill business, drove constantly in his daily work, in addition to evening and Sunday driving for pleasure. His own estimate, aside from the speedometer figures, place his average daily running at 75 to 100 miles.

Cadillac Gets Another World's Record.—Up in Detroit they are not satisfied to have the greatest number of factories and the most employees, the largest output, and all that sort of thing, but now must needs make factory production records for the whole world to gape at. The Cadillac Company recently did themselves proud when 74 complete cars were turned out and shipped in a single day. This sounds simple, but reducing it to minutes, this means a car every 12 minutes for 16 consecutive hours. This record-breaking feat was made necessary by the unusual pressure brought to bear by the selling agents, all of whom are calling for cars and more cars. The Chicago dealer incidentally made another world's record when 225 orders were sent in in one day. It behooves manufacturers to sit up and take notice now, or the Cadillac'll get 'em!

Fire Company Adopts Simplex.—A big deal in automobile chasses was put through in New York City recently when the American-La France Fire Engine Company, of Elmira, N. Y., contracted to take a good sized portion of the Simplex Automobile Company's output. The Elmira concern is the largest in the country manufacturing fire-fighting apparatus, making about 80 per cent. of all the fire engines produced to-day. After much investigation, the company decided that the 50-horsepower Simplex was best adapted to fire department requirements, combining as it does strength, power, speed, and flexibility of manipulation, with standing-up qualities. These chasses are to be fitted with regular chemical fire engine equipment, and in years to come will doubtless save much property from destruction.

More Up-to-Date Sales Methods.—One of the pronounced tendencies of the day is the matter of changes in selling methods, all firms attempting to keep right up to the minute in this respect. The Gabriel Horn Mfg. Company, Cleveland, O., has just made a very important change in its sales methods. Heretofore it has sold its products not only to manufacturers, jobbers and dealers, but to individual users as well. Now it is thought more economical to make shipments in quantities direct to its own representatives, and this has made it wise to establish exclusive agencies in all the cities of the country. All sales hereafter will be made

through these agents, who will be responsible for seeing that Gabriel products are properly put on cars and work to the owner's satisfaction.

Can't Buy a Second-Hand P. & S.—According to the Palmer & Singer Mfg. Company, of New York City, two so-called bargain hunters trying to buy Palmer & Singer "Four-Forty" limousines at a reduced price were unable to do so. The list price of $5,000 was more than they cared to pay, and they made an earnest effort to find other "Four-Forty" owners in order to buy their cars second-hand. They easily enough obtained the names of a number of "Four-forty" owners under the plea of wishing to ask them how their cars were performing, and it gladdened the hearts of the sales force that every owner refused to sell his car on any terms whatsoever. The two purchasers, utterly unable to get "Four-Forty" cars in the second-hand market, returned to the big Broadway house and purchased new cars.

Races on the Coast.—The first automobile race of the year will be a double century endurance contest around the San Francisco Bay. This will be held on February 7, the first car leaving Golden Gate and Van Ness avenues at 6:30 A.M. The checking points will be at Oakland, San José and Garden City. Thirteen cars have already entered, including three Buicks, two Tourists, one Auburn, one Rambler, one Reo, a Stoddard-Dayton, a Mitchell, an Oakland, an E-M-F and a Studebaker. The roads are in such condition that an all-day job is expected by the competing drivers.

Philadelphia Salesmen Dine.—To show his appreciation of the efforts of the hard-working sales force of the Auto Sales Corporation, of Philadelphia, President Percy Neel, of that concern, last Thursday night banqueted them at the Cedar Park Driving Club. Bert Maucher, "Bill" Street, Ralph Cook, George Brooks, L. S. Julien, Bert King, Albert Kirk, Roy Hagerling, Ed. Burnshaw, J. B. Dickson, Morris Penrose and others were on hand, although a sudden illness prevented the attendance of President Neel.

Smashed Denver Record.—The automobile road record from Denver to Colorado Springs was broken recently by Wesley Smith, driving a 6-70 Thomas Flyer. The old record, 1 hr. 58 min., was held by Harold Brinkler. Smith's new mark of 1:50:32 clips 7½ minutes off of this. The announcement of this feat has stirred up a lot of excitement, and it is understood that Brinker will immediately go after the new mark.

Monthly Meeting of A. S. M. E.—The next monthly meeting of the American Society of Mechanical Engineers will be held in New York City February 23, the fourth Tuesday of the month, instead of the second Tuesday, as usual. The subject of the evening's discussion will be "Safety Valves," a brief paper by Frederic H. Whyte, mechanical engineer of the New York Central Railroad lines.

Factory Proposed in Savannah.—One of the results of Savannah's Grand Prize race may be seen in the recently announced formation of a company to go into the business of automobile manufacturing. C. P. Henderson, one of those interested, will soon leave Savannah on a tour of the South to find what type of car is most desired there. It is hoped to have the factory in operation by the end of this year.

Banquet for Hartford Dealers.—The Allyn House, Hartford, will be the scene of a good time on Tuesday evening of show week, when the Hartford Automobile Dealers' Association will hold its annual banquet in the Automobile Club quarters.

IN AND ABOUT THE AGENCIES.

Hoyt Electrical Works, New York City.—A complete stock of the electrical instruments manufactured by the Hoyt Electrical Instrument Works, of Penacook, N. H., will hereafter be found in New York City at 1931 Broadway, where a branch office, in charge of R. V. Sutliffe, as manager, has been opened.

Firestone Tires, Cleveland.—On March 1 the Firestone Tire and Rubber Company will open a branch office in Cleveland. For this purpose the company is remodeling the storerooms at 1918-1922 Euclid avenue, in the heart of the automobile row.

Nadall Rims, Cleveland.—The Nadall Manufacturing Company, of Chicago, makers of demountable rims of that name, have appointed Way, Mitchell & Company its Cleveland agents. Their address is 1120 Euclid avenue.

Columbia, Pittsburg, Pa.—Dr. R. E. Dinger, president of the Central Automobile Company, has returned from the New York shows with the news of his appointment as agent for the Columbia line.

Palmer & Singer, Philadelphia.—William and Charles Miller, 441 North Broad street Philadelphia, have been appointed agents for the Palmer & Singer for the Quaker City and adjacent territory.

Franklin, Oakland, Cal.—The Consolidated Motor Car Company, which has the San Francisco Franklin agency, has established a branch at Telegraph avenue and Twenty-second street, Oakland.

Hoffecker, Cleveland.—The Hoffecker Company, speedometer manufacturers, has opened a local branch at Euclid avenue and East Nineteenth street, with J. E. Strater as local manager.

Rauch & Lang, Milwaukee.—Welch Brothers Motor Car Company, Seventh and Grand avenues, Milwaukee, have added the R. & L. electric to its line of cars, which is headed by Packard.

Nadall Rims, Canada.—The Dominion Auto Company, Ltd., of Toronto and Montreal, Canada, has taken over the sole rights of the Nadall demountable rim, on a royalty basis.

Stearns, San Francisco.—C. S. Richardson, manager of the Reliance Automobile Company, has just closed a deal whereby his firm gets the agency for the Stearns.

Moon, Providence, R. I.—C. M. Linton, who has the Jackson and Welch agencies here, has added the Moon to his list.

Jackson, Minneapolis, Minn.—The La Crosse Implement Company has been appointed agent for the Jackson car.

Kisselkar, Newark, N. J.—Welden & Bauer have been appointed State agents for the Kisselkar.

Elmore, Spokane.—Smith & Rockwell have taken the local agency for the Elmore.

RECENT BUSINESS CHANGES.

Levi & Hipple Motor Company, Chicago, has removed from the Wabash avenue site to 1467-69 Michigan avenue, where the new models of the Lozier, Autocar and Chalmers-Detroit lines are now on exhibition.

Kellogg Mfg. Co., Rochester, N. Y.—This is the new name of the Wray Pump & Register Company, well known to the trade as manufacturers of auto pumps and registers under the Kellogg patents.

Supplementary Spiral Spring Company, New York City, has removed to 215 West Fiftieth street, just off of Broadway.

PERSONAL TRADE MENTION.

Jesse Froehlich, treasurer of the Times Square Automobile Company and managing director of the Benz Auto Import Company of America, sailed for Europe on the *Mauretania* February 3, and will visit the Benz Motor Works at Mannheim, Germany, to arrange for an immediate shipment of Benz cars. It is an interesting fact that on January 30 Mr. Froehlich sold three Benz cars personally in one day, one being to Herman Ridder, proprietor of the New York *Staats-Zeitung* and president of the Publishers' Association of New York.

Marcus I. Brock has been appointed manager of the Thomas Motor Cab Company, which is fastered by the E. R. Thomas Motor Company, of Buffalo. He is well known in the trade, having been sales manager of the Autocar Company and prior to that time assistant general manager of the A. L. A. M.

F. M. Germane has been promoted to assistant general manager of the Standard Roller Bearing Company, of Philadelphia, his former place as sales manager being filled by T. J. Heller. F. W. Lawrence has also been appointed Western representative, with headquarters in Chicago.

A. R. Pardington, vice-president and general manager of the Long Island Motor Parkway, Inc., has gone to a sanitorium at Mt. Clemens, Mich., to take the rest cure. He will return to New York in time to superintend work on the parkway.

V. M. Palmer has accepted the position of chief engineer with the Selden Motor Vehicle Company, of Rochester, N. Y. He was formerly with the Pope Mfg. Co. at the Hagerstown works.

Louis E. Elmer, the Hartford, Conn., agent for the Ford, who has been confined to the hospital for some time, is now able to be about a little each day. His many friends will be gratified to learn of his improvement in health.

Thomas W. Henderson, manager of the Detroit Winton branch, was married to Miss Maud Nicol Hawley, of that city, recently. Mr. and Mrs. Henderson are now in the East on their bridal tour.

E. V. Stratton has succeeded Frank Yerger as manager of the Philadelphia branch of the Studebaker Company. Mr. Stratton was formerly sales agent for that company in New York State.

H. Nelson Dunbar has accepted the position of sales manager with the Gabriel Horn Mfg. Co., of Cleveland. He was formerly with the Packard Motor Car Company, of Detroit.

George Daley, a well-known Philadelphia automobile writer, has joined the sales force of J. C. Bartlett, who recently took on the Quaker City agency for Woods electric vehicles.

Francis H. Warwick, formerly of New York City, has been placed in charge of the sales department of the Colburn Automobile Company, Denver, Col.

DEATH OF S. R. BALL.

S. R. Ball, head of the famous decorating firm of S. R. Ball & Co., New York City, died very suddenly at his home on February 9. This concern has made a specialty of show decorations and have been responsible for the fine appearance of the Grand Central Palace and Madison Square Garden automobile shows for many years back, as well as numerous other automobile shows in Philadelphia, Pittsburg, Kansas City and elsewhere. He will be missed by a host of friends and business associates.

INFORMATION FOR AUTO USERS

"Rist-Fit" and "Ventilated" Gloves.—Comfortable and classy automobile gloves for all seasons charaeterize the output of the Morrison-Ricker Mfg. Co., of Grinnell, Ia., and "Rist-Fit" and "Ventilated" gloves have heeome popular and

ADJUSTING THE "RIST-FIT" GLOVE.

well known the country over. One type of glove has a smooth strap leather cuff made from choiee "Reindeer" and black eolt skin of highest wearing quality, and another has a dignified gold initial in Old English. The "Rist-Fit" is a patented device which allows the glove to be drawn snugly at the wrist, keeping the euff up and exeluding dirt, snow, etc. Its application is shown in the illustration. The Morrison-Ricker Company also makes one-fingered mittens for winter use, whieh are finding much favor with some drivers.

The gloves for winter use are wool lined, lamb lined, and squirrel lined. Those for spring and summer are unlined or silk lined, and have the "Ventilated" back, whieh consists of rows of tiny perforations too small to admit dust, but which will allow air to enter and keep the hands eool and dry.

Hill's Automobile Specialties.—The Hill Dryer Company, of Worcester, Mass., announees in its eatalogue No. 9 an exceptional list of speeialties for the automobile which will appeal to the discriminating buyer. These specialties are of the nature of drip pans, waste cans, gasoline measures and funnels. The first mentioned is a drip pan which instead of being turned in at the rim is

HILL'S COMBINED MEASURE AND FUNNEL.

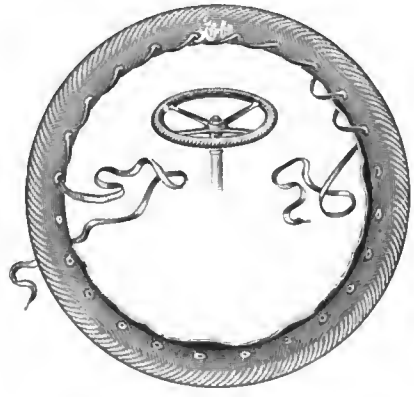
turned outward, and rolled in such a manner that the seam eomes on the under side of the pan. This method leaves no eraeks around the edge of the top of the pan that are neeessary to pateh with solder in order to make it water-tight. It is made in two sizes. In oily waste cans the eompany make two styles, the full, round type in three sizes, and a speeial half-round type in one size, all of which are fitted with special self-elosing covers.

A eombined measure and funnel, the design of whieh is shown in the illustration, made of extra heavy tin, is made in four sizes, and fitted with fine brass strainers at a slight additional cost. A speeial line of funnels, suitable for the automobilist is also manufactured, in various designs to meet requirements. All of these funnels are fitted with fine brass strainers and movable hoops to hold ehamois when ehamois is used to

HILL'S FLAT FUNNELS—TWO STYLES.

separate any water that may be present in the gasoline. It is interesting to note that the shape of the funnel is elliptic, thus affording the exact shape of "spilling" liquid, and redueing the spaee required in the other plane.

Steering-Wheel Grip.—Wet and rainy weather prevailing just at present should stir up a considerable interest in the matter of steering-wheel grips. One of the best of these is the Alpha, made by Parker, Stearns & Company, New York City. This has a roughened tread, if it



ALPHA STEERING WHEEL GRIP.

may be so called, and is made of rubber, either black or red being optional. The inside portion is open and provided with eyelet holes, so that it may be laced up tight. When this is done a roughened surface, upon whieh the hands will never slip, is assured at all times regardless of weather. In the interest of safety every machine should have something of this nature added to its equipment where the original steering wheel had a smooth surfaee.

Don't Lie Down in Grease.—For the benefit of garage men and others who have of a necessity to lie down underneath a car while working on the mechanism, the Portland Garage Company, Portland, Me., makers of the Repairman's Couch, send this messagc: "Don't lie down in grease or oil." This eouch is made very low and light, and runs on casters, so that it may be utilized under any car anywhere. The head-rest por-

PORTLAND REPAIRMAN'S COUCH.

tion is adjustable, so that the position of the head may be varied to work to the best advantage. The body of the couch is fabrie but tightly stretched so as to be springy and easy to lie upon. The head rest, on the other hand, is upholstered so as to be unusually comfortable. In faet, it is almost possible to imagine that after the long use of this, the men might get to like working under the ears.

New Holley Carbureter.—After eight months of eonstant experimenting, G. M. Holley, of the Holley Brothers Company, Detroit, determined to his satisfaction the exact amount of gasoline and air required by a motor under all conditions of speed and load, and found the following chief essentials: A high vacuum around the nozzle for starting; a perfectly uniform mixture at all speeds, exeept hill climbing with wide open throttle; no limit as to motor speeds, and a device that would maintain all eonditions eonstant. The accompanying illustration shows a sectional view of a carbureter that has been developed by the Holley Brothers Company to fulfil these conditions. The regulation type of concentric float chamber is employed, but the needle is made adjustable for raising or lowering the gasoline level. The mixing device consists of a taper needle for admitting gasoline *A*, sliding in the taper nozzle *B*, surrounded by the small strangling tube *C*, the needle *A* being eon-

nected to the adjusting rod *D* by the ball joint *E*, whieh eliminates side thrust and wear in the nozzle *B*. The air valve consists of the strangling tube *C*, and the taper and flanged body *F*, the coarse threaded serew *G* being fastened to the air valve at *II*. The rod *A* and the valve *F* move together, according to the requirements of the motor. *I-I* are bottom stops; *J* is the upper stop. It will be apparent from an inspeetion of the sectional view in conneetion with the above deseription that known quantities are being dealt with

in making adjustments, and once the proportions of the taper needle and the air valve are right they will stay so for good. No springs being employed, conditions in the carbureter remain constant.

New Style of Brass Auto Horn.—The Automobile Supply Manufacturing Company, Brooklyn, N. Y., has added another style of horn to its line for the coming season. The latest Nonpareil horn, as

THE LATEST NONPAREIL HORN.

shown in the illustration, is distinctly novel in design and has a far-reaching, deep, penetrating tone. Letters patent No. 39,746 were issued to the inventor, Louis Rubes, on this horn on January 5 of the present year. Mr. Rubes is the president of the above-named company, and six years ago he started the business with a working force of seven men, since which time it has grown to such an extent that now 246 men are employed, and, besides the Emerson Place and Classon Avenue plants in Brooklyn, a new factory, located at 220-224 Traffle Place, that city, has been added to meet the demand. At the present time the company is turning out 3,000 horns a week. The new horn illustrated above is meeting favor with the trade and bids fair to be one of the most popular sellers among the company's productions.

Patterson Wireless Dry Battery Holder System.—The great ease with which incandescent lamps are screwed into sockets is only equaled by the permanence of the connections and the fact that the electrical contact is good and secure. This same facility is afforded in the Patterson system of assembling dry batteries as used

PATTERSON BATTERY BOXES E AND F.

in ignition systems on automobiles, and it is plain to be seen that the same method allows of the quick alteration of the relations of the cells of battery, enabling the motorist to take advantage of (a) all the cells in series for the maximum voltage, (b) multiple series connections of sets of four cells in such a way as to realize the voltage of four cells and the added capacity of sets of four, as eight, twelve and so on. The system comprises a substantial moulded composition (rubber) plate, in which is incorporated the component members of the screw tops on the respective cells. The receptacles for the cells are so devised and arranged as to enable a "dead" cell to be removed without opening the circuit. Then, there is an entire absence of wires and other loose details which every autoist regards as a nuisance. It is also a fact that the cells of battery are held in secure and rigid relation by the "plate," with the result that the cells are not chafed, which is beside the fact that inter-cell leakage is prevented in the same way. The sets of battery come in several selections as to size. With substantial and ornamental cases the appearance is up to a high standard of art and utility. Stanley & Patterson, 23 Murray street, New York City, are the manufacturers of the Patterson "wireless," and the reward for business acumen is by way of a large list of satisfied customers, ever expanding.

Vehicle Top Support.—"It is the little things that count." In other words, they count for comfort and satisfaction if they are right, and in the case of top supports it is assured annoyance in the absence of a suitable design, since broken bows in-

MORAN'S VEHICLE TOP SUPPORT.

terfere with the results. Stephen J. Moran, of Cambridge, Mass., makes a top support (patented) which is here illustrated, and, as will be seen at a glance, it has merit as its companion.

A Wrench for Unhandy Places.—About the meanest situation for a man to find himself in is with a nut to tighten and to have a wrench which for some reason or other cannot be used to tighten it. To cater to this business and to make a wrench that can be used anywhere, the Lowell Wrench Company, of Worcester, Mass., has produced the "Multo" autowrench. This has several features worthy of individual mention, thus it is a ratchet arrangement. This allows of tightening up nuts in a situation where the swing of the handle is limited. Another idea is that it is a socket arrangement, fourteen sockets being provided to accommodate the ordinary range of nuts. This is sold in a neat box with the fourteen sockets and the ratchet handle, the wrench being sold only with the unbroken set of sockets. The illustration shows a "ghost" view of the tool box with the ratchet and full set of sockets.

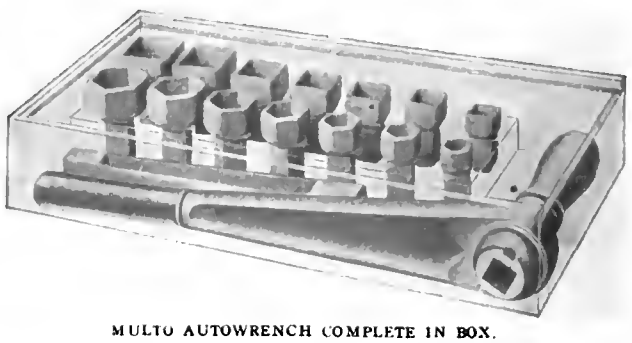
New Timken Roller Bearing Axle.—In line with the constant improvement in rear axle construction is the latest product of the Timken Roller Bearing Axle Company shown herewith. The axle proper is a one-piece pressed steel member of smooth

TIMKEN DIFFERENTIAL AND BEVEL CARRIER.

and regular outline. The gradually diverging lines of the tubes between the hubs and the central differential case does away with the angles and joints always found in the built-up types. The differential and bevel gear carrier is a compact unit that can be removed bodily from the axle housing without taking down the axle or disturbing brakes, hubs, or bearings. It is anchored to the front of the case. All bearings can be adjusted from the outside by means of worms. The brakes are internal and external on the rear hubs, 14 inches in diameter by 2 1-2 inches wide. The construction

INTERNAL AND EXTERNAL BRAKES.

has been greatly simplified and the number of parts reduced to the minimum. The axle will be made in floating and non-floating types for cars weighing up to 3,000 pounds empty and of 45 horsepower or less. With this form of construction of few parts and simple, the weight is reduced to a minimum without any corresponding sacrifice of strength.



MULTO AUTOWRENCH COMPLETE IN BOX.

Vol. XX New York—Thursday, February 18, 1909—Chicago No. 7

THE AUTOMOBILE

DETROIT HAS A NOTABLY ARTISTIC SHOW

DETROIT, Feb. 17.—Once each year the Detroit Automobile Dealers' Association and local manufacturers tear themselves away from the strenuous task of supplying the rest of the country with cars long enough to demonstrate what a real automobile show is like. They're at it this week, and the pace set is one that will compel would-be competitors to throw in their high speed and then trail along in the rear. Frankly stated, there is no second to Detroit in the matter of appearances. New York's two shows were imposing affairs, as shows go. Chicago's exhibition, in spite of being overdone in some respects, was up to the usual high standard. But none of the three equalled in an artistic way the standard set by the Detroit association at its second annual show, held in the Wayne Casino.

This may seem like an extravagant statement, but it isn't. When Manager E. LeRoy Pelletier was associated with Fred Thompson back in those days that the Pan-American Exposition was in the making, he was given a valuable schooling in the advantage of "dressing up" an exhibit. He has been watching automobile shows ever since, and noting wherein they fell short from the viewpoint of the spectator. Pelletier was brimful of ideas when appointed manager of the local dealers' show a year ago, and in spite of the handicap attendant upon the inadequate quarters in which it was held managed to furnish surprises that long remained pleasant memories, in addition to making the show a financial success.

This year he was again given carte blanche, and with more than twice the space ever before at the command of the local show has provided a revelation. The first thing Pelletier did was to engage the services of Edward Wagner, a sculptor who won distinction with his work at the Pan-American Exposition. Wagner is a Detroiter, and put his heart into the task mapped out. The result is apparent.

Expense was no object. It was the understanding that if necessary $10,000 might be spent for decorations. It was, too. As a matter of fact, when the show was thrown open to the public more than $11,000 had been expended in preparations. It is well worth every dollar it cost, though. In planning the exhibition the Detroit Association was not figuring on profits. It wanted to impress on Detroiters and the country at large what the automobile industry meant to the city—and it has succeeded most convincingly and at the same time artistically.

Both floors of the Wayne Casino have been utilized, and so cleverly have the arrangements been planned that one surprise follows another until the climax is reached on the second floor. Entering the Casino, visitors pass into the section set apart for accessories. Never lending themselves well to a harmonious arrangement, it has nevertheless been possible to place them so they show to good advantage in their segregation.

A few steps further on there bursts upon the spectator's view a scene that causes him to gasp with admiration. Stretching away seemingly for a half mile is a vista amid which the highly finished motor cars are singularly at home. Extending from one end to the other of the great hall is lattice work hiding much of the ceiling, and extending down the sides at regular intervals. Twined through this lattice is Southern smilax in profusion, giving an impression of midsummer in marked contrast to the season. The side walls are given over to great paintings representing scenes familiar to local motorists.

Down the hall extend four rows of latticed pillars, the centers of which are formed of colored glass with electric lights enclosed. Thousands of colored electric bulbs are strung about the ceiling and along the sides, and scores of cages containing canaries hidden among the smilax add to the summery effect.

On the second floor Sculptor Wagner was given a free hand to work out the ideas evolved by Manager Pelletier and himself, and the effect is highly pleasing. At the outset Manager Pelletier's cunning in planning illusionary effects is shown. Up a dead black staircase the visitors pass, and are suddenly confronted by heroic sized figures in staff depicting "The Spirit of the Automobile." Seated at the wheel of a car, the lower part of which is enveloped in dust, sits a man bare to the waist. Beside him sits a woman holding in her outstretched hand the palm of victory, while just ahead speeds an American eagle. The surprise is

General View of the Detroit Automobile Dealers' Association's Artistic Show.

complete, but it is only incidental to the general arrangement. In the center of the great auditorium rises a thirty-foot fountain of staff, twenty-seven feet in diameter at the base. The upper basin is supported by a half dozen mermen chauffeurs, faces set, muscles rigid, hands grasping steering wheels. Surrounding the fountain is an enclosure fifty feet in diameter, bearing at regular intervals the head and shoulders of a motoring girl done in staff. Here the thoughtfulness of these in charge of the show is evidenced, for the enclosure is designed as a resting place for the fair sex, upholstered seats extending entirely around the inside of the circle.

All the standard makes whose names have been familiar in the motoring world for years are much in evidence, comparison with the same cars of a few years since providing an interesting object lesson on the development of the industry since its inception. There are men among those present, too, who witnessed the birth of the industry, chief of them being Henry Ford, Detroit's pioneer automobile maker.

Accessories manufacturers are here in large numbers and are quartered at the west end of the main floor. The commercial vehicles are also housed in this section and are attracting much attention, as is the exhibit of motorcycles.

In spite of inclement weather the opening night witnessed a rush that made it difficult to handle the crowds even with the provision made. Every night has been a repetition of the opener and dealers are elated. Actual sales exceed all previous years, day for day, by a large margin, and from the inquiries made it is apparent that great numbers of Detroiters are in a hurrying mood.

Detroit Has Outdoor Show Idea.

One of the interesting bits of news coming out of this week's show has to do with making Detroit not only the automobile manufacturing center of the country, but the sales center as well. While those back of the movement decline to go into details, the general outline of the plan is to hold an automobile show and carnival in Detroit next August, at which time all the new models will be shown under conditions that are impossible at this season of the year. August is the month tentatively selected, and the State Fair Grounds the place where this novel exhibition will be held. The grounds are easy of access and there is one of the fastest mile tracks in the country upon which to demonstrate.

Michigan produces 60 per cent. of the automobiles made in America, representing 50 per cent. of the value of this country's output. Millions of dollars are invested in plants, and tens of thousands of men are given employment in the manufacture of motor cars. In Detroit alone 50,000 automobiles will be made this year. Why, then, argue those back of the plan for a midsummer exhibit here, should Detroit manufacturers be compelled to exhibit hundreds of miles from home at a time when agencies have been placed and every energy is being directed to filling orders.

Detroit and Michigan manufacturers who have been sounded on the proposition are enthusiastic. Detroiters who are just beginning to realize what the automobile and allied industries mean to the city are for it. The Detroit Automobile Dealers' Association, which has shown the rest of the country what a real show is like, is a unit in favor of the undertaking, realizing that it would mean the bringing to Detroit for a week of 10,000 to 12,000 agents and automobile enthusiasts, and give the city even greater prestige than it now enjoys.

List of Firms Exhibiting Cars.

The following is a complete list of firms in the Detroit association exhibiting. This, however, does not represent the full line of cars, as several of these concerns handle four and five different makes, while almost without exception two lines are represented:

E. M. F. Co.
Rapid Motor Vehicle Co.
Cartercar Co.
J. B. McIntosh Auto Co.
Rumsey Electric Co.
Maxwell-Briscoe-McLeod Co.
American Electric Auto Co.
Grant Bros.
Regal Motor Car Co.
Wm. F. V. Neumann Co.
Coombs & Gilmour.
Cadillac Motor Car Co.
Seldler-Miner Co.
Anderson Carriage Co.
Ford Motor Co.
Brush Runabout Co.
Olds Motor Works.
J. H. Brady Auto Co.
Winton Motor Co.
J. P. Schneider.
W. S. Isbell.
Buick Motor Co.
Standard Auto Co.

This list does not include the power wagons or accessories manufacturers and dealers, of whom there are many.

For the success of this year's show, in addition to their own efforts, the Detroit Automobile Dealers' Association can thank Manager Pelletier, and George Lane, president; John P. Schneider, vice-president; Robert K. Davis, secretary, and J. H. Brady, treasurer, who have worked untiringly for the good of the cause.

ST. LOUIS SHOW HAS BLIZZARD BEGINNING

ST. LOUIS, Feb. 15.—Struggling with a blizzard of no mean proportions, the exhibitors at the third annual show of the St. Louis Manufacturers' and Dealers' Association had some difficulty in getting their cars to the Coliseum in time for the opening to-night, but were in the end successful. In spite of the difficulties of transportation and of walking in the streets, a goodly number of automobile enthusiasts were present, and were immensely pleased with what they saw.

This, the first show held in St. Louis under the management of a committee from the Manufacturers' and Dealers' Association, might be classed with the greater of the minor shows, although it is the first time that a St. Louis exhibition has merited the classification. Approximately 130 cars are displayed by some forty exhibitors. The figures are more than double those of last year or the year before, when the show was held at the Jai Alai Building in the West End.

A large part of the show—at least nearly 30 carloads of automobiles—came from the Chicago show. Nineteen of these cars came by fast freight in an automobile special. Six more were sent by a special express running on passenger schedule, and one car was attached to a regular passenger train. The distribution of these machines at the Coliseum began as early as Sunday afternoon, and by Monday morning early the cars in the 19-car load shipment began to arrive at the Coliseum and at the same time snow began to fall, which had increased by night to a blizzard. If there had been any motor trucks available for the transportation of the automobiles from the freight yards to the Coliseum there would probably have been no difficulty, but most of the machines were hauled by horse-drawn wagons which had trouble with the snow. To overcome the difficulty many of the machines were dismounted from the sluggard wagons and run under their own power.

The only car shown here for the first time was the Frayer-Miller, which did not appear at either of the New York shows or the Chicago show. Besides several pleasure cars, a Frayer-Miller truck without body was exhibited.

The local dealers, some of them handling several makes of cars, exhibited as best they could and were in nearly every case ably assisted by their factories. The several local manufacturers, including the Moon Motor Car Company and the Dorris Motor Car Company, gave about the same exhibits that they had at the Chicago show, although the Moon was slightly limited for space here. It is said that the Moon cars that were to have been brought back from Chicago were sold at the Chicago show by a new agent demanding immediate deliveries, and the St. Louis exhibit had to make up from cars in stock at the factory.

To have the decorations complete, Chairman John J. Behen and acting manager, Lloyd Rickert, worked all through Saturday night and Sunday without sleep, but the result was worthy of their trouble. The illumination was particularly good—as it not always is at auto shows.

Besides the attraction of the 1909 cars, many of them shown in St. Louis for the first time, the management provided motion pictures of the Savannah Grand Prize Race and the Grand Prix at Dieppe. At one end of the auditorium the mammoth Gabriel horn was played, while at the opposite end of the building a large band helped to make things lively.

A large list of cars never exhibited in St. Louis before were on view, including the following: Darby and Victor, made in St. Louis; Stoddard-Dayton, Mitchell, Overland, Atlas, Woods (electric), Oakland, Franklin, Rambler, E-M-F, Studebaker (gasoline), Jackson, Regal, Stanley (steamer), Detroit (electric), Marmon, Chalmers-Detroit, Cadillac and Frayer-Miller. The

Installing the Exhibits of the St. Louis Automobile Show in the Big Coliseum.

Locomobile and Apperson cars, handled by the Capen Motor Car Company, were exhibited at the Hotel Jefferson.

The complete list of exhibitors follows:

MAIN FLOOR.

Peper Automobile Co.
Moon Motor Car Co.
Union Electric Car Co.
John Deere Plow Co.
South Side Automobile Co.
Park Automobile Co.
Victor Automobile Mfg. Co.
Doyle-Curran Motor Car Co.

BUFFALO SPORTSMEN'S SHOW PLANS.

BUFFALO, Feb. 15.—Under the auspices of the Buffalo Launch Club and the management of Dai H. Lewis, the Annual Power Boat and Sportsmen's Show, which will be held for a week beginning with March 8, is promised to Buffalonians as a "spectacular revel, replete with many amusement features." Manager Lewis has placed no limit upon the expense necessary to make it a success and has embodied many new points in decorations, equipment and in the quality of the exhibits.

In the matter of decorations, he will "provide a perfume effect by lavish use of hothouse flowers, a forest effect of trees in staff, with a wild animal and ornithological display in their branches, and an electrical effect which will throw a brilliant dazzle over all," according to Dai. Many applications for space have been received.

ALL READY FOR NEWARK'S SHOW.

NEWARK, N. J., Feb. 16.—Everything is ready for the opening of Newark's Second Automobile Show in the Essex Troop Armory on Saturday. Workmen have been engaged all week in the laying of the floor, and the decorators have practically finished draping the armory building in the National colors. Every inch of floor space has been taken, and the show will be a very representative one. There will be about thirty different makes of cars on exhibition, and included in the list will be the Acme, Brush, Cadillac, Chalmers-Detroit, Ford, Crawford, Fiat, E. M. F., Grout, Jackson, Isotta, Kissel-Kar, Locomobile, Marmon, Maxwell, Mitchell, National, Oldsmobile, Overland, Pennsylvania, Pierce-Arrow, Peerless, Premier, Rambler, Regal, Reo, Stevens-Duryea, Stoddard-Dayton and White.

There will be about 75 or 80 cars on view during the week, aside from a complete line of accessory exhibits. An elaborate program has been arranged for the week, which will include music every afternoon and evening and a moving picture exhibition every night.

The show will be opened by George E. Reeve, president of the Newark Board of Trade, who will deliver an address from the balcony of the armory building at 8 o'clock Saturday night. This address, which will open Newark's biggest and best automobile show, will for that reason be of absorbing interest to those present. It is expected that society will turn out "en masse."

Wednesday night will be set aside for the New Jersey National Guard and will be termed "Troop Night." Thursday night will be "Club Night," and the show will be attended by members of the various automobile clubs of New Jersey. On Friday night the show will be attended by the New Jersey automobile dealers. There will be several meetings of automobile clubs during the week, the most important of which will be that of the Associated Automobile Clubs of New Jersey, which will be held at the show on Thursday evening, when legislative matters will be discussed.

BLUE BOOKS FOR 1909 WILL MEET ALL REQUIREMENTS

THE assurance with which various clubs, leagues, and associations prognosticate future usefulness and unblushingly appropriate what has been done by others, is paralleled only by a vivid and optimistic imagination of the temperature of the tide undulating under the serene and soliciting sunshine of the month of May, which invitingly says, "Come in; the water is warm."

For the information of the tourist who may not desire to personally test the temperature of the ebb and flow of these multitudinous tides promulgated solely for his benefit, but incidentally to sustain an ebbing financial situation, an accurate and timely thermometer should be a valuable instrument.

Whatever is of assistance to the automobile tourist, whether of public or private origin, is to be commended, but he must not be misled either by the promise of doing in a day what requires months of laborious effort or by captious criticism of what has already been accomplished to the satisfaction of many thousands of automobilists.

Even "The Official Automobile Blue Book" did not at first contemplate the enormity of the undertaking when, several years ago, its publishers began the work of authentic road directions, and, while equipped with every facility and enjoying the cooperation of every club and thousands of motorists, it was still found necessary to travel by automobiles equipped with editors experienced in writing road directions and expert draftsmen with ready pencil to sketch intricate places from which hundreds of outline maps could assist the descriptive text.

The "Blue Book" began its work in 1903, since which time it has been issued annually, no expense having been spared to make each succeeding edition complete, authentic, and timely as to the modifying conditions of each season. The 1909 edition, the first section of which is now on the press, will consist of four volumes, covering respectively (1) New England, reaching into New York State; (2) New York, reaching the Middle West; (3) New Jersey, Pennsylvania, and the South; (4) Chicago and the Middle West, comprising 2,642 pages of text, assisted by 700 outline maps, all strictly originally constructed and executed. The text, besides carefully prepared directions from notes made from an automobile on the spot, contains largely cyclometer reading of distances and useful information of reliable hotels, garages, and matter of general interest. Upwards of 100,000 miles covering main trunk lines have been thus accurately recorded, with changes from year to year covering local conditions, until the "Blue Book" work has become the recognized authority in all localities east of the Mississippi and has unwittingly formed the groundwork of many club touring sections dependent on it for its information, and numerous imitating competitors, who copied even the errors it contained.

Meantime the "Blue Book," unheralded by flaming prognostication or competitive organization, is *per se* a wholesome supply of authentic information for tourists in the territory covered, which is available to the public generally, without red tape or trapping, as a strictly private enterprise on a basis of minimum expense for actual service rendered.

While the "Blue Book" does not predict its future or cast a horoscope for others, it is proud of the work it has already accomplished, and is fully satisfied that its efforts have been and will be appreciated. The "Blue Book" series come from the Class Journal Company, 231 West Thirty-ninth street, New York, and 1200 Michigan avenue, Chicago.

CHICAGO'S SHOW RESULTS IN PLENTEOUS SELLING

CHICAGO, Feb. 13.—The big Chicago Show which to-night came to a conclusion supplied a total of business done never before equaled by an automobile exhibition in this metropolis of the West. Of course, figures of all kinds are current in regard to the sales accomplished, but a conservative estimate of the grand total involved in cars purchased directly or indirectly as a result of the show would reach a mark not far from two million dollars.

"It is my judgment that the sales averaged ten cars for each exhibitor," said Manager S. A. Miles, "although it is impossible as yet to give anything like definite figures."

In the matter of attendance something close to one hundred thousand people undoubtedly passed the entrance doors of the Coliseum and First Regiment Armory. A study of the throngs that attended made apparent the fact that many had come from quite a distance in order to get a look at the 1909 products of both licensed and unlicensed manufacturers.

That a national show of this character is satisfactory to the average buyer was plainly apparent. It has been suggested in regard to New York another year that one show follow immediately upon the heels of the other, and perhaps be held in the same building. This plan would permit people to attend the last few days of the first show and also attend the succeeding exhibition. Much comment in favor of such a plan has been heard in Chicago, and it is not improbable that something of the sort may be arranged. This would permit accessories makers to exhibit at both shows with lesser expense and greater convenience to themselves. It is understood that efforts along this line have been discussed.

Among other subjects considered at the two days' conference of the traffic managers of automobile factories during the Chicago Show was the question of suitable freight cars for automobiles. The facilities of the railroads are being taxed more and more by the increasing output of the automobile industry and the traffic managers of the respective lines are anxious to provide freight cars that will secure for them a portion of this attractive business.

General Traffic Manager J. S. Marvin, of the National Association of Automobile Manufacturers, presided at the meeting, and pointed out the necessity of arriving at a uniform recommendation to the railroads so that the new freight cars built for this purpose would suit the requirements of all factories. The meeting recommended the double side-door plan of box car, which gives an opening ten feet in width and nine feet or more in height, placed diagonally opposite each other in the car. Such doors permit the loading of the largest machines. For double-decking purposes, that is, the loading of an extra tier of machines above those on floor, car should also have one end door ten feet square. This double-decking is accomplished by means of a skeleton work of timbers, and the plan is coming into favor for shipments of the smaller class of machines long distances, where the freight rates are high and where the minimum weight charged by the railroads is considerably in excess of the actual weight that can be loaded on the floor of the car only.

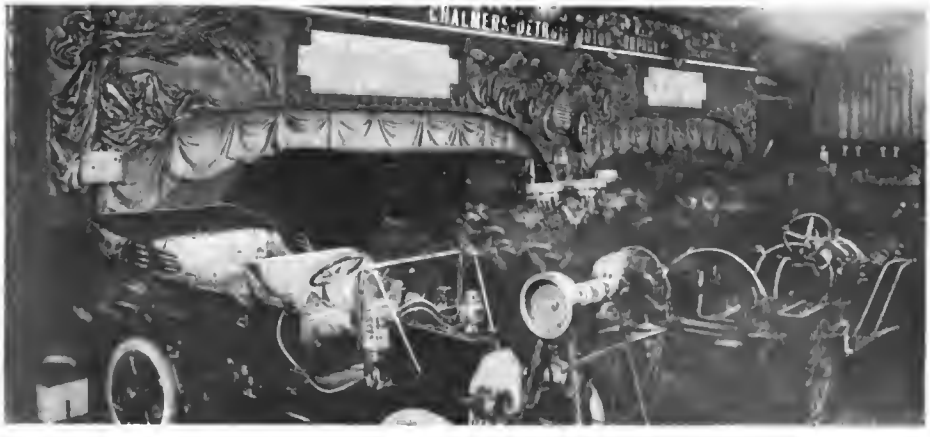
It was found impossible to recommend at the present time any one length of freight cars, owing to the fact that the railroad companies in the different parts of the country have conflicting rules as to minimum weights on cars of different lengths. For shipments to the Pacific Coast 50-foot cars are in demand. Other sections of the country 36-foot cars are favored, owing to the fact that a penalty in the shape of higher minimum weights is assessed by the railroads on longer cars.

An arrangement of particular interest to the Pacific Coast trade was effected whereby G. F. Detrick, chairman of the Automobile Trade Association of San Francisco, will, in connection with similar trade associations in other Pacific Coast cities, act as the Pacific Coast branch of the National Associa-

Thomas 6-70 Flyer, Midwinter Record, Denver to Chicago; Distance, 1,400 Miles; Running Time, 114 Hours.

Mitchell Thirty, with Magneto Ignition, in the Foreground.

Pennsylvania with a Model D-25 Selective Three-Speed Shaft Drive.



Chalmers-Detroit Thirty with En Bloc Cylinders.

Oakland Thirty Roadster with Thermo-Syphon System of Cooling.

tion's traffic department. It is expected that this arrangement will result in bettering the shipping conditions as they now exist with respect to that territory.

Record Run of a Thomas.

The Thomas people made considerable capital out of the finish of the Denver-Chicago record run of Wesley Smith, who wound up his trip at the Coliseum at 8:10 o'clock Wednesday night. Smith had smashed the Denver-Colorado Springs record in a Thomas six, cutting eight minutes off the old mark, and, enthusiastic over this, he decided to try for a mid-winter mark to the Chicago show. He left Denver at 1:15 o'clock Wednesday afternoon, February 3, being accompanied by A. E. Blanchard from the Thomas factory, James McDonald, a mechanic, and two newspaper men. The roads were in frightful condition because of the frozen mud, but by 9 o'clock Thursday night the car had reached Julesburg, Col. Omaha was made by 6 o'clock Saturday night. The Iowa roads were worse than the ones in Colorado. The gumbo mud forced the crew to work for hours at a time with block and tackle to get through. At one place the car broke through the ice crossing a river and it took twelve hours to get it out.

"From this point on it was even worse," said Smith, in describing the run. "Instead of getting better, the roads became worse, and when we reached the Illinois line we struck the terrible blizzard of the 7th and 8th. The intense cold and driving sleet forced us to seek shelter for the first time or perish with the cold. We arrived at Morrison, Ill., at 12 o'clock February 8, but after stopping a few moments we again took to the road and managed to reach Sterling, where we were compelled to rest. Leaving at a late hour Wednesday, we bucked the snow drifts and managed to reach the Coliseum at 8:10 o'clock.

"The total distance between the two cities is about 1,400 miles, which we made in 114 hours actual running time. We were in bed only two nights, the balance of the time taking turns sleeping in the tonneau. We came through without a replacement. Our car is a 70-horsepower six-cylinder, and was completely equipped except that we had no top.

"This car and driver also hold the record between Los Angeles and Goldfield, Nev., of 20 hours, but the trip from Denver was the hardest it has ever made because of the road conditions. We covered some of the distance that will be on the Glidden tour route next summer if it goes to Denver, but if dry weather favors the tourists there should be little of the trouble that was experienced in midwinter. We also tried some of the rules proposed for the transcontinental race, that of sleeping in the tonneau, and found that it could at least be done successfully, but there was little rest secured. The fact that it took three days to cross the State of Illinois alone is an illustration of the difficulties encountered.

APPERSON IGNITION PATENTS.

By VICTOR LOUGHEED.

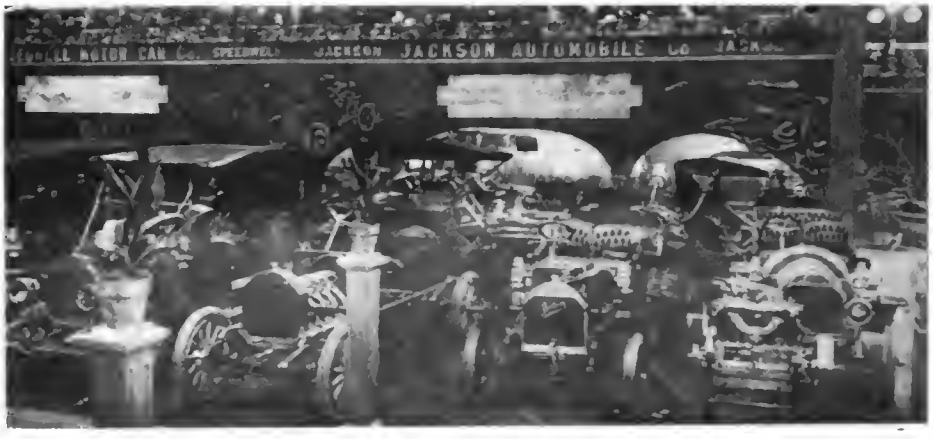
CHICAGO, Feb. 15.—There was much talk during the Chicago show concerning the Apperson patents on double ignition, which are claimed by the Apperson interests to cover basically every possible system in which two or more spark plugs are used. It is not claimed that the dual ignition systems, in which appears one set of plugs in combination with a double current source, infringe, but that some sort of a fight on the others is in the air can scarcely be doubted. Already a number of manufacturers admit having received infringement notices while the Apperson people stoutly and openly defend their position.

Among the very considerable numbers of offenders there is a variety of attitudes. Some of the more timid appear secretly worried to such an extent that it will not be surprising if in the near future several manufacturers that had decided double ignition to be good should decide on second thought that the simpler system is better after all, and revert to it forthwith. Others preserve a non-committal attitude to the extent of flatly refusing to discuss or opinionate on the subject. And, finally, very numerous indeed are those who discount the claims of the Kokomo pioneer and declare that they are waiting for him to attempt his worst. Bartholomew, for example, builder of the Glide, exhibited a three-cylinder casting made by him for Charles E. Duryea in 1894, in which appears provision for jump spark in addition to the regulation make-and-break ignition used on the stock machines produced by the Reading man. Duryea himself is outspoken in his opinion that the Apperson device was too long anticipated to be made the subject of a valid patent, while there are even those who whisper that a search of European stationary-engine practice will reveal double-ignition employed as early as twenty years ago. Patent sharps, too, suggest that the Apperson claim only purports to cover simultaneous ignition at two or more points within a cylinder, and, therefore, has no bearing on the mere provision of double systems adapted to use in alternation rather than in conjunction.

It at least admits of no doubt, should the courts sustain the Apperson claims, that a very fat slice of automobile profits for a while will trend Kokomoward, until back royalties are settled and ignition systems reorganized. This is sufficiently evident from a consideration of the threatened infringers, whose numbers and standing as strongly attest the popularity of double ignition as their more or less outspoken disapproval attests the unpopularity of the attempt to monopolize it.

In the Stoddard-Dayton cars one side of the system derives its current from a Bosch high-tension magneto, while the other secures it from a six-volt storage battery, worked in conjunction with a standard multi-vibrator coil of well-known make.

Atlas Two-Cycle Model F Is Fitted with Atwater-Kent Ignition.



Jackson Model H Is the Center of Interest, Especially the Roadster.

A Sea of Originality with a Runabout to Whet the Interest.

Pullman Model L with Selective Three-Speed Geared Roadster.

The same system is used in some of the Rambler models, except that a Splitdorf single coil with master vibrator is employed, and that the eight plugs are in the eight valve caps.

Another example of the same general type appears in the Oldsmobile, in which the Bosch magneto and six-volt storage battery are in combination with a multi-vibrator Heinze coil, with the plugs through the valve caps.

The big Austin cars employ a Splitdorf magneto, and, on the battery side, six dry cells with a Splitdorf master-vibrator coil. The spark plugs pass directly through the cylinder heads.

Special interest attaches to the Haynes scheme, this car being turned out by Apperson's former associate. Moreover, in the particular feature in question it practically duplicates the Apperson, Bosch high-tension magneto, six-volt storage battery, and two plugs paired through each intake valve cap being the details in common. In the Haynes, however, a single coil with master vibrator is favored.

Pierce cars have one set of plugs in the cylinder tops and one in the inlet valve chambers, with Bosch high-tension magneto on one side of the system and six-volt storage battery on the other. Separate vibrators in the Autocoil pattern are used.

The Premier construction involves primarily the Bosch low-tension magneto with the mechanical make-and-break through the inlet valve caps. The alternative system, worked from a six-volt storage battery through a Pittsfield distributor and single coil, connects to plugs in the sides of the inlet-valve chambers.

Bosch high-tension storage battery, and Splitdorf coil tell most of the Bartholomew story. The eight plugs are in the eight valve caps. The two systems can be used together.

In the Corbin cars, the purchaser is offered the alternative of Bosch high-tension or low-tension magnetos and plugs, with a six-volt storage for the battery system, in conjunction with a Connecticut multi-vibrator coil. Each plug is in a valve cap.

The Knox is the same as the preceding, except that the low-tension option is not given.

In the Lozier, the eight plugs are in the eight valve caps, with a Connecticut master-vibrator coil on the battery side. Otherwise the specifications are the same as in the other high-tension Bosch and six-volt storage battery systems.

Bosch, Eisemann, Splitdorf, or Dow at the extra price is the range of options in high-tension magnetos offered by the Cadillac people in their new model. The regular equipment, on the battery side, is six-volt storage, with Jacobson & Brandow multi-vibrator coil. Plugs are in the valve caps.

A storage battery with Leavitt distributor and Bosch high-tension magneto constitute the combination approved by the National. Plugs are in valve caps.

The two-cylinder American Simplex is the first of its type to appear with duplicate ignition. Bosch high-tension magneto, six-volt storage battery, Heinze multi-vibrator coil, and plugs through the cylinder heads constitute essential specifications.

Stevens-Duryea uses Bosch and storage battery in combination with multi-vibrator Pittsfield and Connecticut coils, the plugs being in the valve caps.

A double system of rather unusual but of some years' standing is the combination of dry cells and Bosch high-tension magneto in the Thomas cars. The Atwater-Kent device keeps down current consumption on the battery side. The plugs are in the valve caps.

The rechristened Toledo cars tie to the all but invariable Bosch high-tension magneto and six-volt storage battery. The coil is Splitdorf multi-vibrator, and plugs are through cylinder walls.

Dependence mainly on the Bosch high-tension system is evident in the big Stearns model, in which the alternative Connecticut multi-vibrator coil takes its current from dry cells. The plugs are slanted together in pairs in the inlet valve caps.

The Welch ignition is the same as that of the Toledo, except that the Connecticut multi-vibrator coil is offered as an option, and the plugs are close together in the cylinder heads.

Similar to the foregoing is the Pullman system, except that in the coil is the Connecticut master vibrator. The magneto plugs are in the cylinder heads and battery plugs in inlet valve caps.

The plugs each in a valve cap, the use of dry instead of storage cells, and the fitment of a Pittsfield multi-vibrator coil are the only important differences between the Speedwell and the preceding ignition system.

Lambert cars carry the Remy magneto, six-volt storage battery, and Kingston multi-vibrator coil. The plugs are in the valve caps.

The Mora scheme is the same as that of the Speedwell, with the substitution of storage for dry battery.

Moline ignition differs from that of the Speedwell only in that the Pittsfield master vibrator coil is provided.

The Halliday cars are equipped like the Moline, except that the Pfanstiehl multi-vibrator is on the dashboard end.

In the six-cylinder engines of the Fort Pitt Motor people, a Connecticut six-vibrator coil with six-volt storage battery is on one side and the Bosch high-tension on the other. Plugs are paired in inlet valve caps.

Another "six" is the Ricketts with U. & H. magneto, dry cells, master vibrator, and plugs in opposite sides of the cylinders.

Only the 50-horsepower car of the Marmon line qualifies in the double ignition class. It has Bosch high-tension magneto, dry cells, Heinze multi-vibrator coil, and two plugs in each inlet valve cap.

The Auburn arrangement almost duplicates the foregoing, but the plugs are distributed one to the valve cap, and a six-volt storage battery is preferred to the dry cells.

Three Characteristic Accessory Stands that Attracted Much Attention at the Chicago Show.

TREND IN TRANSMISSION PRACTICE

By Thos. J. Fay

Chapter III

IT is not enough to have in hand physical properties of the steel if it is true that the results are to be of the greatest possible magnitude. The steel should be investigated from the several points of view and an attempt should be made to locate the limits of utility very definitely. As a good aid to the process it is well to heat treat the steel in divers ways, and if a microscope is not available, have photomicrographs taken of the steel under the several conditions. If the steel can be viewed under a microscope at about 350 diameters, it will be possible to arrive at a very substantial conclusion as to the respective physical characteristics of the structure.

In this class of work, as in everything, it is pretty nearly sure that if the steel looks good it is good. It will be shown in this article that the structure of the steel changes as the heat treatment is altered, and an attempt will be made to illustrate the fact that it is the structure that looks close and uniform under the microscope that is the structure to depend upon in general practice. The only reason for thus entering into this phase of the subject is to assure the interested reader of the fact that it will be unnecessary to hesitate to take an interest in this phase of the subject, giving as a reason the fact that it is rather deep water.

Closer acquaintance with the appearance of structures will come in time, and as the structure unfolds to the eye of experience the story will broaden and the benefits will multiply. In the meantime there is no denying the fact that the benefits that will follow even crude attempts are well worth while. Take, for illustration, the photomicrograph H-5, which is of chrome nickel steel, and it is plain to be seen that the structure would hold out little promise by way of shock ability. Compare this structure with H-4 of the same material, and it will be seen that in H-4 there is no indication of the whitish zones characteristic of "burnt" steel.

Both of these specimens were of the same material, both were treated in the same way, but the specimen H-4 was carefully heat treated, while the specimen H-5 was allowed far too much liberty in the process, and it was reduced to the level of no value, in that it was "burnt." Both of the specimens belong to the brand of chrome nickel steel marked BND in the table of steel products to set before the designer. The notched bar test of this steel in the treated state, with a structure as shown in H-4, was given as 360 foot-pounds (Fremont). The same steel "burnt," as shown in H-5, would not be worth recording. Under these circumstances it is plain to be seen that it is not the steel which indicates failure in many cases.

Indeed, it is quite true in this class of work that failure is very frequently due to wrong treatment of the steel. On the other hand, there is something to be said of steel which is too easily depreciated in the process. Steel should stand a certain amount of irregularity in treatment, and it should bend to a "corrective" retreatment to a fair extent. If steel is overheated it should be reannealed, and in the reannealing process it should be possible to restore the structure, as a rule.

With a view to showing the extent to which annealing will render the structure close and of a uniform texture, the photomicrograph H-3 is given. But if the steel is annealed, in the absence of the tempering process the structure will look as it does in H-2. On the other hand, if the steel is tempered and not annealed it will take on the structure as seen in H-3a, if the normal steel looks as it does in the view H-1. All the photomicrographs as above given are of chrome nickel steel of the grade BND in the table of the products as given.

Of the BND products, H-1 was magnified to 580 diameters and the remaining products of the same brand were magnified to 350 diameters. The photomicrographs are somewhat better than the average, due in a large measure to the fine quality of the steel. The steel is used for gears of the highest grade, in which the faces of the gears can be as low as 3-4 inch, considering a 30-horsepower transmission gear set, and the low-speed pinion, six pitch, 14 teeth.

In the same fashion it is possible to know the appearance of all the grades of steel and to know as well the condition in which the material resides. It is necessary to know this in order to fix upon the treatment to give the steel in any given case. Indeed, it is not always possible to procure material from the mill and assume that it is in the "normal" state. Then there is the question of what constitutes normal steel. Some mills send the steel out as rolled, more anneal, but the annealing temperature is not always the same, nor is it true that the product is always rolled to the same limiting temperatures.

By way of indicating the extent to which steel changes in structure, as a result of changes in composition, the photomicrographs as follows are offered: 18-E is a chome vanadium steel,

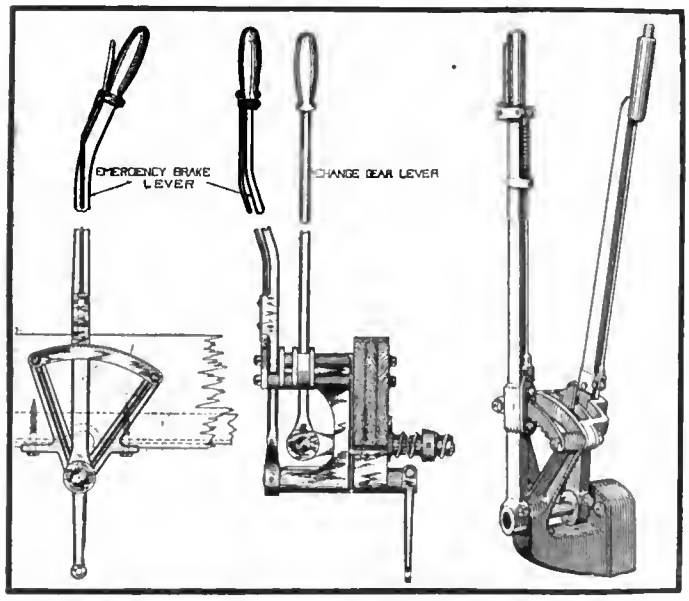


Fig. 15—Franklin Brakes and Change Gear Control.

Fig. 16—Characteristic Side Lever System.

with 16 points of carbon, low in vanadium and chromium, made by the basic open-hearth process, magnified to 350 diameters, after deeply etching and vertical illumination. The steel is in the normal state, and, with a view to showing the result of cementing, the core of a cemented section is given in 20-E, after quenching 850 degrees centigrade.

Just to show the contrast, it will be possible to give a photomicrograph, BO-1, of a specimen of 25 carbon basic open-hearth steel, the same in the annealed state. This steel is magnified to 250 diameters and was annealed from 800 degrees centigrade. It is of no value in gear work of any sort, such as should go into automobiles, and a comparison with some of the other products is enough to indicate the fact.

Importance of Straight-Line Levers and Linkages.

With suitable materials at hand the next question is to contend against all eccentric features of design, not only in the levers and in the linkages, but throughout the transmission system. It is quite out of the question to expect even fair results if all the lever rods are with crooks in them; the quality cars of the present time are noted for clean straight designs, and history, as it relates to cars which failed to come up to the best requirements, records the fact that no attention was paid to this important matter. A strut or a strain member will do its best work if the same is straight, in the plane of the strains and free from all diagonal tendencies. That it is possible to avoid interferences is proven by the large number of cars on the market in which every lever, rod, and relating member is straight and true, barring the crankshaft in the motor, which, of course, has to be capable of performing the reciprocating functions.

A curve in a lever marks the point at which the load will concentrate, hence the point at which deformation will be first noticed. Economy in the use of metal, for a given factor of safety, demands that the designs be straight-line; this is even more important than the question of the metal, for the reason that the modulus of elasticity is no higher in good than it is in inferior steel, as a rule. If parts are not straight, it is then that torsional strains will have to be handled, and under these conditions the question of the modulus of elasticity has to be taken into account to a serious extent.

If torsion and bending moments are present—and they will be in many cases—if straight-line designing is not practiced, the need for good steel is due to the bending moments, and the quantity required will be increased in view of the combined moments. The argument is vastly in favor of straight-line designing, even at the expense of redesigning a car just to realize the safety which such designs carry in them as inherent properties. The fact that torsional work brings into play the question of the modulus of elasticity as a requisite in the process of design, and the further fact that the modulus is not higher in superior steel, is no good excuse for using the inferior steel, on the ground that the dynamic life of the steel is the factor to emphasize, and this life is not pronounced in the steel of inferior quality.

Noise Is Due to Vibrations and Loose Fits.

Distinguishing between a sound that does not grate upon the ear and what is called noise, is to point out that noise is due to more than the fact that lost motion may be present. If gears do not run on the pitch line, or, if they are not cut accurately, noise will be due to these facts. On the other hand, if the same gears are shaped like a bell, they will accentuate all noise tendencies to a marked degree, and to avoid the noise, it is necessary to keep away from the bell-like shape. That gears will "squeal," if the pitch-line velocity is high, is well known, and while some cars are designed with the pitch-line velocity of the gears in the transmission as high as 1,600 feet per minute, the fact remains that 1,000 feet per minute is the maximum for that performance which is classed as noiseless.

Noise is also due to the fact that the gearcase is thin in many cases. If a noiseless performance is desired, it is necessary to use enough metal to assure a slow rate of vibration, and on this account it is a matter of small moment; the fact remaining that aluminum is stronger when cast thin, than when the walls are thick. The fact that aluminum is light renders its use in quantity sufficient desirable and by taking advantage of this idea it is possible to abort the noise due to a high rate of vibration in the gearcase, and for that matter, in the motor case as well.

Plain bearings always did have the property requisite for noiseless performance, and when ball and roller bearings came into vogue it was directly ascertained that some noise crept in. In recent times, the use of "silent" types of ball bearings reduced this tendency to a marked degree, and since roller bearings are spaced, they are not offenders to any great extent. Under the circumstances it is a fact that the bearings should not be a source of noise, and they certainly are to be preferred to plain bearings for the reasons as follows:

(a) They are more easily lubricated.

(b) They will not so quickly get into trouble if the lubrication fails.

(c) Less energy is absorbed in the bearings, hence the mechanical efficiency is increased.

(d) The weight of the system is decreased in view of the fact that the housings do not have to be so long.

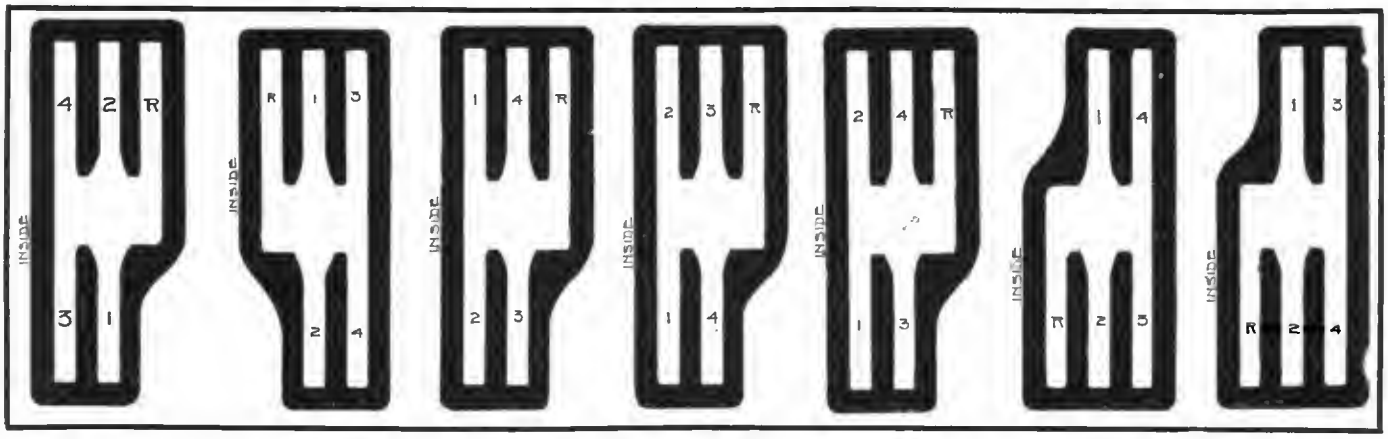

Fig. 1. Fig. 2. Fig. 3. Fig. 4. Fig. 5. Fig. 6. Fig. 7.

Types of Four-Speed Selectors as Used on Prominent American Automobiles, Showing Wide Variation.

(Fig. 1) Lozier Model G; (Fig. 2) Peerless and Stearns; (Fig. 3) Studebaker; (Fig. 4) Lozier Model H; (Fig. 5) Matheson; (Fig. 6) Toledo; (Fig. 7) Simplex.

(e) Alignment is of less importance if ball or roller bearings are used, although this is no recommendation in favor of disregarding the correct alignment of the bearings.

Some Features of Selective Types of Gearsets.

Selective types of gears have the advantage of the progressive plan in one particular, in that the gears do not have to be arranged so that they will "clash" in both directions. As a result the effective face of the selective gears is more, since the face must be reduced enough to bring about easy engagement (through the good office of a wedge-shaped contour) which must be on both engaging faces in the progressive gears.

In other respects selective types of gears differ to some extent, as, for illustration, the skill of the operator must be such as to enable him to determine the proper gear to slide in the train in order not to place the motor at a disadvantage. This is a feature which does not have to be considered in connection with progressive gearsets on the count that the gears are shifted progressively and the shifts correspond to the car speed.

The question of the gear ratio is the same in both types of gears for the reason that the conditions to be satisfied are the same. Just what the gear ratio should be is a matter which depends upon the several conditions as:

(a) The speed of the motor as it relates to the attainable speed of the car.

(b) The ultimate speed of the car.

(c) The rate at which acceleration is to be engendered.

(d) The design of the motor, taking into account the torque curve of the same.

(e) The degree of harmony of the several relations.

(f) The competence of tires used.

In a general way it is considered that the sliding gears (assuming three speeds ahead) should be geometrically related in the manner as follows:

MILES PER HOUR			In a four-speed transmission the third speed would be as follows:
First.	Second.	Third.	
5	10	20	15
6	12	24	18
7	14	28	21
8	16	32	24
9	18	36	27
10	20	40	30
11	22	44	33
12	24	48	36
15	30	60	45
20	40	80	60
25	50	100	75

NOTE.—With four speeds the geometrical relation of the three-speed system would be retained and the fourth speed would be interjected between the second and the third of the three-speed system, so that the third speed would become the fourth, in a four-speed system.

If the power of the motor is barely sufficient for the purpose, it is plain that the second speed should be nearer the third speed, and the practice, in general, is to favor the motor in this way. On the other hand, if the motor is of adequate power, it is then that the second speed can be in the geometrical relation, and this is an advantage on very bad roads, in that the low gear is so advantageously related as to afford adequate advantage under the most severe conditions, while the second gear will be high enough to handle quite bad roads at a fair speed in miles per hour of the car. The bevel drive can have several ratios, depending upon circumstances. The ratio is as follows:

(a) 3 to 1 in light roadster work.

(b) 3½ to 1 in light touring car work.

(c) 4 to 1 in heavy touring car work.

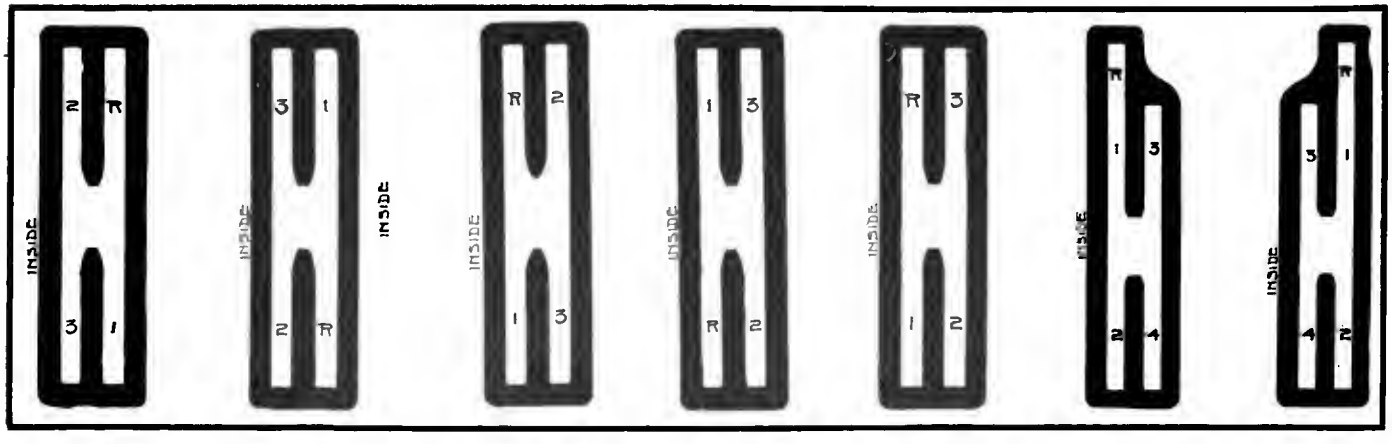

Fig. 8. Fig. 9. Fig. 10. Fig. 11. Fig. 12. Fig. 13. Fig. 14.

Types of Three-Speed Selectors as Used on Prominent American Automobiles, in the Greatest Proportion.

(Fig. 8) Franklin; (Fig. 9) Columbia and Corbin; (Fig. 10) Apperson, Cadillac, Elmore, Knox, Oldsmobile, Walter, Winton and Thomas; (Fig. 11) Oldsmobile Models X and M; (Fig. 12) Buick Model 5; (Fig. 13) Locomobile; (Fig. 14) Thomas.
In publishing the cuts credit must be given to Coker F. Clarkson, of the A.L.A.M., for them.

In the given cases, account is taken of the fact that the power of the motor is barely adequate for the purpose; if the power is in considerable excess then it is possible to alter the bevel gear ratio to suit.

Transmission Gear Ratio in Practice.

This question is one which is best handled in many cases, by stating just what is current in good examples of automobiles; the following is true in one well-known make of car, in which the gear-set affords four speeds and reverse:

WITH MOTOR RUNNING 1,000 REVOLUTIONS PER MINUTE.

Low speed, 15.11 miles per hour of the car;
2d speed, 23.52 miles per hour of the car;
3d speed, 36.64 miles per hour of the car;
High speed, 51.13 miles per hour of the car;
Reverse, 9.94 miles per hour of the car.

Some Questions of Design of Sliding Gears.

Referring to Fig. 17, the cross-section indicates symmetry, in that the web is centrally located, and the thickness of the web (J) approximates that of the flange (I) so that the warping in heat treating will be within allowable limits, if the gears are "nested" properly during the carbonizing process. The thickness of the flange (I) is equal to the value of the "addenda," which is half the difference between OD and PD, in which OD = the

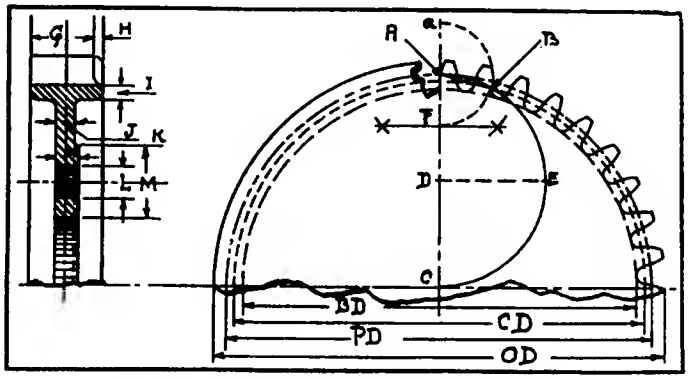

Fig. 17—Design of Square-Cut Sliding Gears.

outside diameter and PD = the pitch diameter. In the old standard machine designing, using cast iron for the most part, it was the practice to make the depth (I) equal to the whole depth of the tooth. In automobile work this depth would far exceed the allowable, for the reason that the "fly-wheel" effect of the gears would exceed the desirable value; indeed, it is the aim to keep down this effect as far as possible. On the other hand, alloy steel, or, "cemented" carbon steel, assures all the strength required under the circumstances in which transmission gears play a very important part.

The question of the shape of the teeth is one which has to be given some attention in view of the importance of the work, and since gears in American car work are of the "involute" genera, which seems to serve well the purpose, it will be the aim here to discuss them. Referring again to Fig. 17, the diameter of the base circle (CD) becomes of importance if it is desired to lay out the teeth of the gears, which, however, is not a matter of great practical importance, in view of the fact that it is not necessary to do so, as a rule. On the other hand, it may become necessary, on occasions, and the manner of approximating the same will serve for the purpose.

Knowing the radius of the pitch circle, C A, the half of which becomes the radius of the circle D E, the axis of which is at D. Taking in turn, half the distance D E as the radius of the arc of the circle F B a, the axis of which is at A, when this radius A B will serve to approximate the addenda curvature of the teeth, provided the axis is on the base circle C D, which bisects the arc of the circle F B a, at the point B. The radius C B then is the radius of the base circle and if this system of circular arcs is used, the involute may be approximated, in so far as it will be necessary, in view of more exact methods of arriving at the magnitudes of the important dimensions, in the following manner:

Some General Formulæ of Involute Gear Teeth.

Considering teeth of the same pitch, if the gears are meshed in such a way that the pitch-circles touch, it is then that the respective diameters are proportional to the number of teeth in the respective gear wheels. The pitch-diameter then is of the greatest importance, and that gears should perform in a noiseless manner it is desirable to so mesh them as to have them ride on the pitch circle. On the other hand, if the gears are machined and then hardened, the dimensions will not be the same after hardening as before, and the mesh will have to be in view of this fact. The exact allowance to make in view of the "swelling" tendency is difficult to state, and the writer, in his work, preferred to measure the meshing gears in a machine designed for the purpose with the result that allowances as follows would seem to be in accord with the requirements:

Pinion.	Gear.	Allowance.
14 teeth.	28 teeth.	.004 inch.
18 teeth.	49 teeth.	.008 inch.

These allowances will indicate somewhat the idea, and it is a fact that the exact allowance will depend upon several conditions as:

(a) The dimensions of the gears and mates.
(b) The quality of the steel.
(c) The carbon content.
(d) The time taken in the carbonizing process.
(e) The effectiveness of the quench.
(f) Warping is a matter which has to be taken into account separately.

Deformation Due to the Heat-Treating Process.

If the gears are symmetrical in shape, and if the material is of a uniform quality, it is then that the manner of handling the product in the process (heat-treating) will have to do with the extent of deformation, more than anything else. If the gears are to be casehardened they should be nested in conjunction with soft iron blanks in such a way as to expose the teeth to the carbonizing process, in which position they should be bolted into rigid relation, with the iron blanks so fashioned as to serve as a backing to pull against. The nest so devised will then slip into the case (of cast iron) big enough to hold the nest of gears and allow for carbonizing material all around the nest of gears. When the gears, so nested, are carbonized, they may be quickly and deftly lifted out of the case and quenched in such a way as to assure that the teeth will have the benefit of the process, while the clamping will serve to abort warping to a vast extent. The gears will be hardened on the surfaces desired to be hard, and they will remain soft on the surfaces which do not have to be hard, but which should have kinetic ability to the greatest possible extent.

This is a matter which has to do with the sizes of the gears and, under the circumstances it is proper to refer to this phase of the question at the time of taking up the question of sizes of gears, from the designers point of view. Some designers have tried to overcome the ills of "swelling" by allowing for the difference in the machining process, and they have had the cutters made in such a way as to fashion the teeth to compensate for the swelling. The idea has some meat in it, but satisfaction does not seem to reside in the scheme, on the count that it demands the use of special cutters, which are difficult to procure, on the one hand, and likely to vary, on the other.

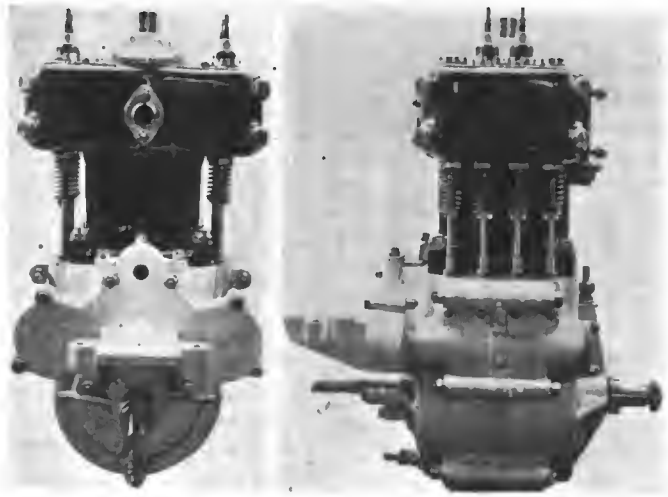
In the subsequent annealing process it will be well to allow the gears to stay in the clamped position for the reason that the same device that will abort warping in the carbonizing and quenching process will also serve in the subsequent annealing process. The object of annealing is to render the structure kinetic.

(To be continued.)

NEW AND NOVEL DESIGNS IN FRENCH MOTORS

By W. F. BRADLEY.

PARIS, Feb. 10.—The task was undertaken by a French constructor more than a year ago of producing a four-cylinder engine of 2.3 by 3.9 inches bore—practically 8-10 horsepower—which should be of such small dimensions that it could be put in the place of any single or two-cylinder engine of 6 to 10-horsepower that has ever been built. The difficulty was, of course, to reduce the overall length, and to reduce it in a greater measure than is possible by a bloc casting and the abolition of the central bearing for the crankshaft.



Front and Side Views of Aries Four-Cylinder Motor.

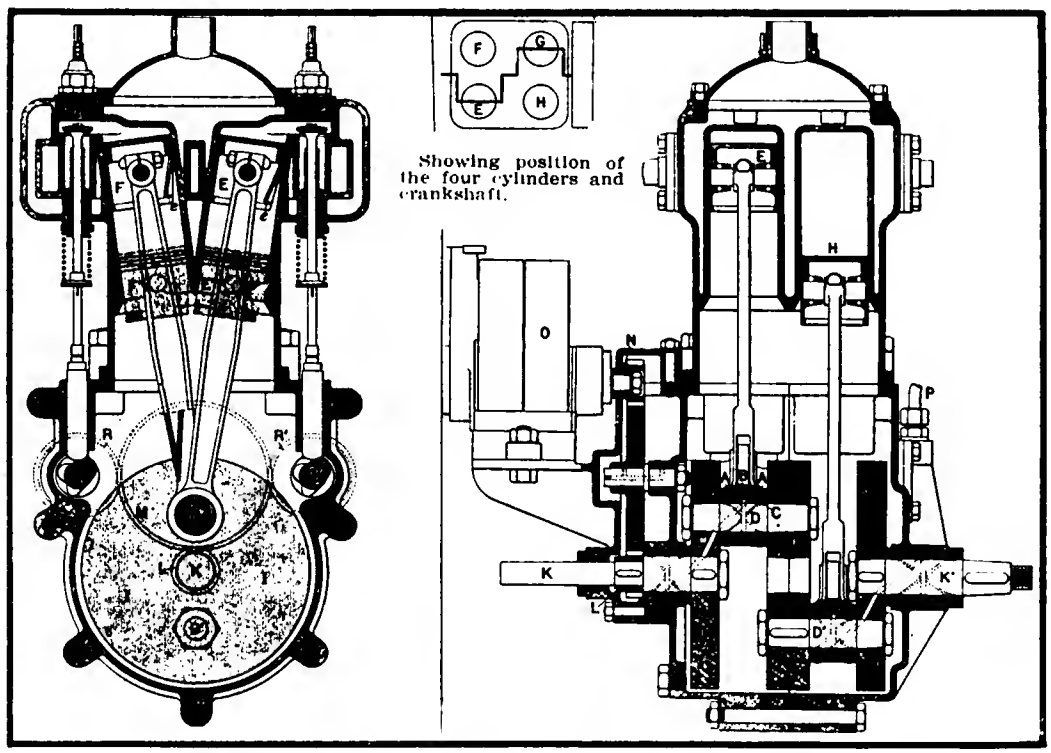
Showing magneto platform, valves and spark plugs down each side in head. The four cylinders occupy same overall length as a standard two-cylinder. The cylinders are slightly in V, thus obtaining a motor which, it is maintained, occupies no more space than a two or four-cylinder of the same power. Note vertical division of the crank case in the side view.

The engine has now been presented by the Aries Company and is certainly of such compact design that viewed from a distance it might be mistaken for a single or a two-cylinder motor. As there has been no distinct departure from the principles adopted and found satisfactory in the construction of vertical engines, the novelty may be accepted as one that will give satisfaction in the rough school of daily work.

The Aries motor consists of two pairs of cylinders slightly in V, but unlike the more familiar type of V engine the casting is in one piece. The two cylinders together forming the V have their pistons connected up to the same pin of the crankshaft; there are thus as many throws as there are sets of cylinders. In this case it is, obviously, a two-throw crankshaft that is employed, with the throws placed at 180 degrees in relation one to the other. The crankshaft is a built-up one formed of three interior flywheels united by two nickel steel connecting rods forming crank pins. The crankshaft is practically of the type made familiar in the De Dion one-lungers and other vertical engines. There is nothing really original in this, the built-up crankshaft having been employed for years on small motors, with very satisfactory results, while having the additional advantage of being very cheaply constructed. As on the single cylinder motor mentioned, the whole is carried on short steel shafts projecting through each end of the crankcase. This latter is divided vertically, being formed of two practically equal parts united by horizontal bolts, as on the majority of vertical single cylinder engines.

It has been stated that two connecting rods are attached to each of the two crankpins. In the usual type of V engine this has frequently led to complications and unsatisfactory solutions. Here one of the connecting rods (A in the illustration) has a forked end; the other (B) is of the ordinary type. A rather thick sleeve (C in the illustration) is forced onto the crankpin, and bears on it for its whole length. The connecting rod B is attached to the center of this sleeve, thus obtaining a bearing on the whole length of the crankpin. The connecting rod A, on the other hand, having a forked end, fits round the head of B, also bearing on the total length of the crankpin.

As will be seen from the illustration, two cylinders forming a pair are inclined outward, the inclination being 7 1-2 degrees from the vertical. On reaching the end of their downward stroke the two pistons forming a pair approach one another, and would come into contact were arrangements not made to prevent this. The disposition consists of cutting away a portion of one of the cylinders only, shown at *e* in the illustration. This loss of material can have no ill effect on the engine, for when under



Front and Side View Cross Section of the Aries Four-Cylinder Motor.

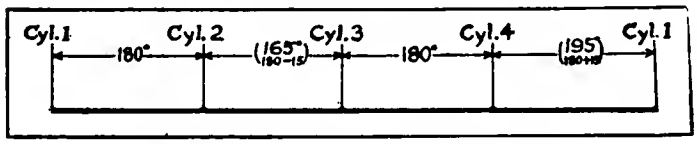
Side View—A, connecting rod end of piston E. B, connecting rod end of piston F. C, sleeve. D, crankpin receiving two connecting rods. EH, pistons. IJI, interior flywheels. KK, crankshaft. LM, timing gears. N, magneto gearing. O, magneto. P, lubricating oil piping.

pressure it is the opposite face (F in the cut), which is bearing on the cylinder wall by reason of the thrust of the explosion. It will be noticed, however, that the opposite piston E has been cut away also; this, however, is merely to make the pistons interchangeable, there being nothing to clear at this point.

In London taxicab work there are two explosions at 180 degrees, then at 540 degrees, the irregularity being overcome by the use of balance weights. In the Aries the explosions occur at the following intervals:



Intervals Separating Four Explosions, Aries Motor.

which is obviously a considerable improvement on the two-cylinder, now recognized, however, as almost perfect in balance.

While the regularity of firing is practically equal to that of a standard four-cylinder motor, the equilibrium of the moving parts is the same, for when two cylinders ascend two others descend.

Other portions of the engine do not particularly call for attention, for the reason that they do not depart from standard lines of construction. The valves, mechanically operated, are of necessity on opposite sides of the engine.

The Korwin & Rebikoff Three-Cycle Motor.

A three-cycle motor has been produced. Like the two-cycle engine, it gives an explosion for every revolution of the crankshaft, without, however, the imperfect scavenging of the spent gases which is the principal objection now raised against this type of engine. The discharge of the exhaust, indeed, on this engine is as perfect as on a motor devoting an entire stroke for each of the four operations.

Imagine a vertical cylinder with the usual type of piston and the addition of an auxiliary piston, which, at the commencement of the power stroke is stationed in the head and above the spark plug. This auxiliary piston, with its face turned downward, or toward the face of the main piston, is indicated by *R* in Fig. 1. During two-thirds of the power stroke it remains immobile in the cylinder head, but as the main piston uncovers the exhaust port *K* near the end of the stroke, the upper auxiliary piston commences a rapid downward movement, driving out the spent gases. The descent has opened the automatic valve *b* in the cylinder head, with the result that while the piston is on the one side driving out spent gases on the other it is drawing in a fresh charge.

When the main piston has descended just below the exhaust port, the auxiliary piston is nearing the end of its stroke. The two almost meet midway in the port opening, coming so close together that practically every particle of gas is expelled through the open port. The upstroke commences, the upper auxiliary piston moving more rapidly than the lower main one. The automatic intake valve *b* naturally closes as soon as the end of the downward stroke is reached, and it is now the automatic valve *a*, placed in the secondary piston, which is drawn off its seat, allowing the gas to pass through into the combustion chamber between the two faces of the pistons. Piston *R* reaches the end of the upstroke much more rapidly than piston *Q*, which latter, following up, compresses the charge that has been admitted through the automatic inlet valve. Thus, on returning to upper dead center, the piston is ready to start again on a downward power stroke, explosion, exhaust, intake and compression having been performed during two strokes only of the piston, and that with as complete an expulsion of the spent gases as can be obtained with an engine occupying an entire stroke for the four operations.

Such is the idea of Engineers Korwin and Rebikoff. The operation of the auxiliary piston is obtained by the connecting rod *C* and levers *G G P* and *n*, shown in the diagrams. In the engine which has been constructed, however, and which has proved its worth in service, the control of the secondary piston is, for mechanical reason, made from above, the levers being on the outside of the crankcase. It is an easy matter, with an engine built on these lines, to obtain varying power by admitting a larger or greater amount of gas into the combustion chamber. All that is necessary is to arrest the upward motion of the auxiliary piston, thus allowing only a portion of the charge to pass through the piston inlet valve, the remainder being uncompressed in the head of the cylinder. This has been done on the experimental engine constructed by making provision for instantaneous change of the length of the exterior commanding levers.

A detail worth noting is that the auxiliary piston has no need of rings. During the intake the speed of the auxiliary piston being one and a half times greater than that of the main piston, the burnt gases are rapidly ejected without being able to pass the auxiliary. During the power stroke the auxiliary piston being in the cylinder head is not under any pressure, and does not communicate pressure to the levers by which it is operated.

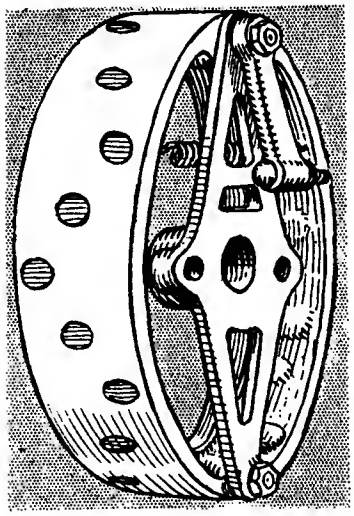
Sectional Plans Showing Operation of Korwin & Rebikoff Three-Cycle Motor.

(Fig. 1)—Commencement of power stroke. (Fig. 2)—End of power stroke. (Fig. 3)—Middle of second cycle, auxiliary piston commences its downward stroke, and aspires through automatic valve "b." (Fig. 4)—End of the second cycle; spent charge has been expelled and intake is completed. (Fig. 5)—Middle of third cycle; compression, the gas passing through automatic valve "a" into combustion chamber.

MODERN TREND OF DESIGN IN MOTOR BRAKES

By LAWRENCE WHITCOMB and THOS. J. FAY, Members Society of Automobile Engineers.

UNDER ordinary circumstances it is well understood that in the braking operation, taking into account the instantaneous value of the initial effort as measured in negative torque values, foots up so high as to engender what would be easily termed excessive torsional values in a shaft, the ability of which would be adequate from the point of view of the "normal" positive (mean) torque of the motor. In view of the fact that it is possible to so design brakes as to defeat this excess initial effort, provided the machine members are equal to the occasion, as measured in terms of the work put upon the members by the clutch, it is possible to regard the ability of a suitable clutch as the measure of the ability of the brakes, and in some measure, at any rate, the plan here will be to discuss the brakes along such lines. The other side of the question takes into account the question of the disposal of heat, at such a rate as to enable the brakes to work for a time so long that the increase in heat (in the absence of some means of disposing of the same) would defeat the project. In the meantime it is assured that no set of brakes would be able to accomplish the task within the limits as measured by the ability of the clutch, in the absence of design features taking into account the amount of energy which can be dissipated while the car is at high speed; which is when the greatest amount of work can be done in the shortest time, hence the time when an effort must be made to absorb the energy; it is the time, however, when it is necessary to guard against excesses by way of "fierce" action.



Cork Inserts in Brake-Shoe.

It is not always the materials of which shoes are made that counts for utility. If the shoes do not cling to the surfaces they will be of no great value, no matter what the quality may be, and if the mechanical means is defective, then it is a fair inference that the performance will be bad in spite of the use of "cork inserts" or whatever the surfaces of the shoes may be.

Product of the Initial Effort.

If the operator presses with a force of, say, 100 pounds, and the lever advantage is on a basis of ten to one it is plain that the members at the end of the linkage will have to sustain under 1,000 pounds. It is not uncommon to see the mechanism so poorly devised as to "give" when the pressure is thus applied and multiplied, and it is no stretch of the imagination to conclude that the multiplication of pressure as theoretically deduced is a long way from the truth. On the other hand, it is unfortunately a fact that the pressure, if it produces a distortion, will have the effect of producing variations in pressure that will end in excessive surface contact at points in the shoes.

The surfaces thus compelled to take more than a fair share of the pressure will wear the most, and so quickly as to bring about acute brake trouble. When brakes are at this stage it will be the natural thing to "adjust" them to new contact, but the original trouble will still be present and the uneven pressure will again wear away the spot of contact, quickly, as before. Such brakes will be called of no great value, and the materials will be condemned as of no use for the purpose when, as a matter of fact, it is the weakling structure that is at the bottom of the whole trouble.

Internal shoes, unless they are of good section and enough strength to maintain their shape, will surely deform just enough to bring about the uneven surface pressure as before outlined, while "band" types must either be very supple so that they will evenly hug the surfaces or they must be rigid in the extreme, in which event it is important to apply the pressure in such a way as to make the axis of pressure the axis of rotation of the drum. This is rarely the case, and with rigid bands it is to court two classes of trouble, at least. In the first place, the bearing pressures will be so lopsided as to cause the bearings to degenerate. Did anyone ever take into account the fact that a pressure which wears out a good bearing will play havoc with a brakeshoe for the same reason?

Influences That Demand Time in Stopping a Car.

If a car is traveling at a low rate of speed, say, 20 miles per hour, the time factor is not a serious matter for then the tire contact is unaffected by the rate of speed to an extent such as will need be taken into account. On the other hand, it is not when cars are going at this low rate of speed that brakes are of the greatest importance and even poorly constructed brakes might be made to serve the purpose.

But when a car is going very fast it is then that the brakes begin to show their qualities, if the brakes are really in possession of qualities to any great extent. As a car speeds up the ground contact of the road wheels becomes more uncertain and the brakes are more prone to fail. The curve given shows that the coefficient of friction falls away quite rapidly as the speed is increased, and the result is that the brakes work at a great disadvantage under conditions of high speed.

It is at the higher speeds, just when brakes become valuable possessions, that the indifferent kind fail in service, not because they will not apply the requisite pressure, but for the reason that the pressure is bruskly applied, if it will be permissible to use such a term to express the condition. When the road contact is uncertain or reduced to quite a low point it is easy enough to see that any sudden application of the pressure will engender skidding, after which the brakes are of little or no value.

At such a time it is essential to have a time factor, and as the shoes contact it is necessary that they "give" a little before the pressure becomes pronounced. Were rubber of a nature to withstand the temperature it would be good for the purpose, because it would "give" with the application of pressure and the necessary time factor would be realized. Once the shoes contact firmly, if in the meantime the road wheels do not skid, then pressure can be added with a considerable force without any fear of causing skidding.

Any material, then, which will allow the shoes to contact gently at first and firmly within a short distance of shoe travel after contact is established will do the work that brakes have to do, within the limits of ability, taking into account the coefficient of friction of the material under the several speeds of rubbing during the process of slowing a car from a high speed to a dead stop.

In this process there are two prime conditions aside from the fact that establishing the working condition during the interim of initial contact is a delicate process that may upset the whole performance. The two condtions are: (a) the coefficient of friction at high rubbing velocity, and (b) the coefficient of friction at low rubbing velocities. They are not the same and the result is that no single set of materials will give all the results desired. But this alone is not of great importance provided the material used will engage well and serve at the higher speeds.

* Paper read at the December, 1908, meeting of the Society of Automobile Engineers, held in New York City.

Metal to metal will not do this, even approximately. The result is skidding will ensue with metal to metal. If skidding does not ensue it will be on account of bad initial contact and the materials will abrade in the process which spells short life of the shoes. This is due to the fact that the materials chatter and in some measure serve to prolong the time of making the contact. During this interval the metals are scored, and later as the contact is more firmly made, the loosened metal is detached.

The material that will engage softly and slow the car down to a point where metal to metal contact is a practical possibility is the material that will abort skidding and protect the metals from undue wear. Cork alone will not serve the purpose any more than will any other soft material. What is wanted is the cork to a limited extent only, and this to be followed by metal-to-metal contact *as a final operation.*

Conditions Favorable to Cork.

Under such conditions the cork will do the engaging and abort skidding while, as the pressure is increased, the cork will press more and more until it recedes into its sockets, when, the speed will have fallen off and metal-to-metal contact will take hold under conditions that will measure success. But it will only be so if a car is arrested from a high speed. From ordinary speeds the cork alone will do all the work and the brakes will act softly and with certainty. This is due to the fact that the effort required to stop a car from a low speed is little in comparison with the effort at a high speed, and it is only under high-speed conditions that brakes so designed will be tested to the metal-to-metal limit.

In nearly every treatise on the subject the situation is handled on a basis of a constant coefficient of friction which is far from the true state of affairs. It follows that brakes do not serve well under certain conditions, even though they might do very well, indeed, under demonstrating conditions in the park at a speed of from 20 to 30 miles per hour with good roads. What to take into account is the moment of friction, as it obtains at all speeds, and try, by some means, to arrive at a constant or nearly constant moment of friction for a constant moment of pressure. This is not quite possible because there is no material that will quite fill the bill, but cork in the insert form comes very near to a complete performance.

When a car is going fast it naturally covers the maximum distance in a given time. It is at such a time that the effectiveness of the brakes will be (a) not worth taking into account if the materials used for the facing will not take hold; (b) the car will be brought to a stop in a short distance if the materials will act during the time the drum is rotating at a high speed.

Under these conditions everything depends upon the ability of the materials during the time the brake drum velocity is high. If materials of a high coefficient will engage at a high speed, then it is plain that just when the car is covering the most ground it will be arrested in its flight to the greatest extent. This is the time when the mass has stored in it the greatest amount of energy, but it is also the time when the energy will be absorbed at the highest rate if it is true that the brakes can be made to work efficiently. This is also the time when the shoes will be damaged if the engagement is not smooth. It will be smooth if a compressible material is used in conjunction with a final metal-to-metal contact.

Clutches and Brakes Compared.

The very clutch, on which so much time is spent, is the exact device that will serve perfectly for brakes. The earnest attempts made to give life to clutches are wanted in connection with brakes. The reasoning for the one is good for the other, and any reasoning that is a fallacy for clutches is a fallacy for brakes. The argument in favor of brakes on the rear wheels to avoid shock to the transmisison is weak, unless it is an admission that the same transmission is damaged by the clutch. If the clutch will hold while the motor slips the wheels, the brakes can do no more. If the brakes would unduly shock the transmission system, so would the clutch. The car that will not stand up with brakes on the propeller shaft will go to rack equally fast, because the clutch will furnish the very same destructive effect complained of in connection with the brakes.

The clutch is operated with great frequency, whereas the brakes are used to stop a car, or to frequently slow down, if the driver is more or less incompetent. At all events, it is the clutch, as a rule, that will do the most damage to a weak car, not forgetting that the motor is the prime source of the power. With a view to showing what it means to have the brakes on the traction wheels instead of upon the propeller shaft, or some other shaft back of the clutch, rotating at a speed higher than the traction wheels, a concrete example may be set down as follows:

Assume a 12-inch brake drum under two sets of conditions as follows: 1. On the propeller shaft making four times as many revolutions per minute as the rear wheels; 2, on the rear wheels at one-fourth the speed of that of the propeller shaft.

Pull in pounds on the periphery of the drum in a given case will be equal to:

$$P = \frac{H.P. \times 33{,}000 \times Q}{2\pi R S}$$

When

P = pull in pounds on the periphery of the drum;
$H.P.$ = the actual delivered horsepower of the motor;
Q = the efficiency of the transmission;
R = radius of the drum in feet;
S = angular velocity in revolutions per minute.

For a case involving a 25-horsepower motor at 1,500 revolutions per minute we have:

Case One.

$$P = \frac{25 \times 33{,}000 \times .70}{6.28 \times .5 \times 1{,}500} = 122 +$$

Case Two.

$$P = \frac{12.5 \times 33{,}000 \times .70}{6.28 \times .5 \times 375} \times 2 = 490$$

In other words, a brake system on the higher speed shaft will balance the ability of the motor under the conditions named, if a pull is exerted equal to about 122 pounds on a drum 12 inches in diameter. If the two drums are used on the rear wheels, assuming an equal division of work, the pull on the main rod will have to be four times the pull for case one, because the speed is one fourth and all the remaining conditions are equal in both cases. Back of the compensating device the effort will be divided by two, and the pull on the respective traction wheel drums will then be 244 pounds approximately, for the case in hand. If the pull on the periphery of the high-speed brake drum is all that can be afforded, then it is plain that the greater pull required on the traction wheel drums will not be available. If the pull required for the lower speed—traction wheel—drums can be allowed, the problem resolves itself into the question of the relative virtues of speed versus pull.

Relative Virtues of Speed and Power.

The effectiveness would be proportional to pressure on the periphery, on the one hand, and to speed upon the other were the coefficient of friction to remain constant for all speeds of slipping, and for all materials, which is not the case. On the other hand, the higher the speed the quicker the action for any material that will prove efficient as the speed increases. In these points we have the reasons for success in some cases and failures in others.

Designers who do succeed consider the abilities of the materials they use, under the conditions of use. Some fail through imitating designs that work, as respects materials, but not under the same conditions, as respects pressure and speed of rubbing.

The abstract coefficient of friction as determined in a laboratory is as far from the true facts, in practice, as it is possible to go. If the materials are pulled over the face of a platen at a low speed, under a given load, for a given area of bearing, the respective materials will perform in proportion to their respec-

tive abilities to cling to the platen surface. The coefficient so obtained affords no clew as to the effect of speed, although it is possible to plot a curve for pressure by the simple expedient of changing the weight for a given area. These coefficients are good, as far as they go, but they do not go far enough to serve the purpose sought, with the result that brakes work, or they do not, merely depending upon the speed of rubbing when pressure is applied for any given material. It makes no difference what the material is, since there is no single genera of material of which we have knowledge that will work under conditions of a constant coefficient of friction, under all conditions of speed.

Composite Shoes Required.

The conditions in practice require the use of two classes of material in the shoes, as follows:

A, A material that will "bite" upon contact at high rubbing velocities; B, a material that will supplant the high-speed clinging material when the speed falls off, and pressure must be increased to continue the effort to a successful climax.

Some six or seven years ago, when cork was at first considered seriously for clutches, Mr. Fay, then executive engineer for the C. W. Hunt Company, decided that cork—if it was good for the purpose—might be used exclusively and instead of an insert, made shoes of pressed cork and tried them out under very exacting conditions of service. The experiment was an indifferent success for the good reason that unsupported cork "crawled" out from under the pressure. It took time to unravel the mystery, and it was ultimately ascertained that too much cork was worse than none at all. Brakes must have shoes that stand up to the pressure, because the mechanism is so closely linked that an excessive increase in the length of the band results in exhausting the travel of the linkage. If a drum, say, 12 inches in diameter, is lined with a material that compresses 1-16 inch the condition will be as follows:

$$3.1416 \times 12 = 37.6992 \text{ inches cir.}$$
$$3.1416 \times 11\ 7\text{-}8 = 37.3065 \text{ or } .3927 \text{ inch difference.}$$

This increase if .392 inches in the length of the band, is more than the take-up will allow in addition to the normal clearance, and the band will then not constrict adequately for the purpose. Increasing diameters of drums increases the trouble, since the length of the band is equal to:

$$2\pi R = \pi D,$$

when R and D = radius and diameter, respectively.

It is easy to see why all cork failed in service. It fell away from the pressure and the take-up reached the limits of available effective sweep. Beyond this point lies an unbroken series of reasons why the cork should be used as an insert, viz.:

A, the cork is not a good conductor of heat, and if it is inserted in metal, the heat will be spread out over the metal surfaces and be radiated from the cork as a result. The cork then will get no hotter than the metal.

B, the cork will grab at a high speed and will snub motion—relative—up to the limit of its ability.

C, when the pressure conquers the rigidity of cork, the inserts will compress in their sockets, without loss of ability up to its limit, since it will contact just the same—not unlike a compressed spring—and present about the same face area as before it is "flushed";

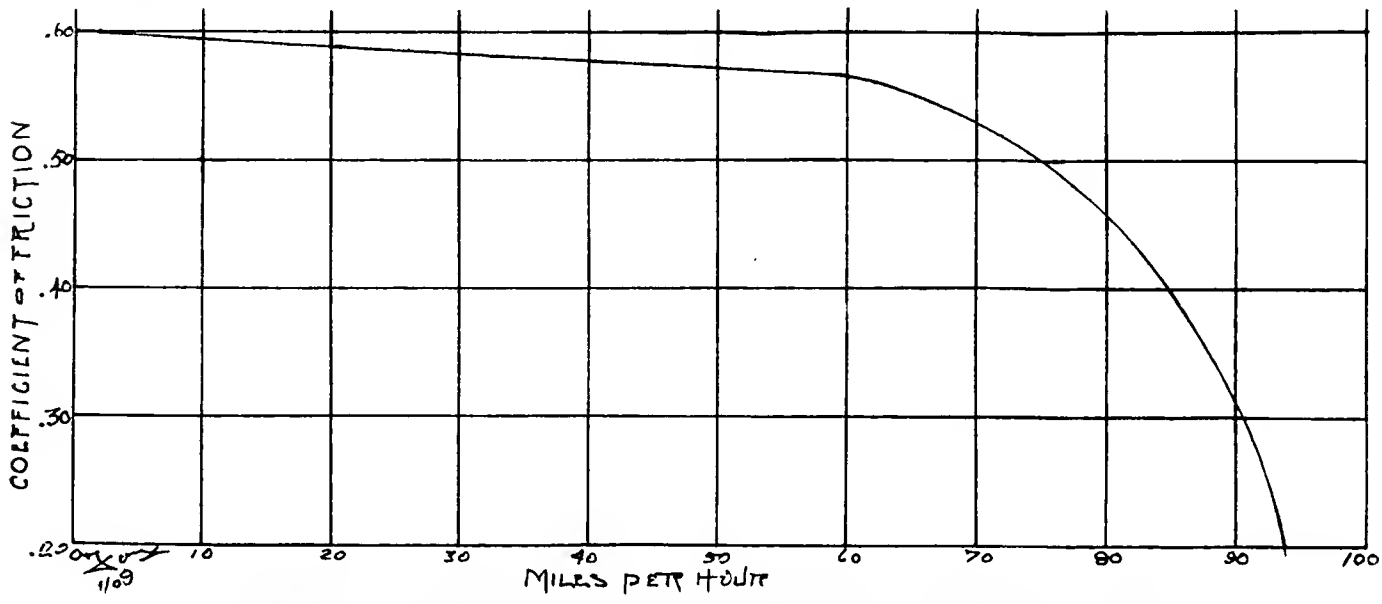
D, when the metal faces contact they do so under high pressure and lowered speed, hence under effective conditions for metal, and it will then grab on as well and render assistance to the receding corks. In these phenomena, we see the reasons why a dual condition of the brake shoe media will best serve the ends to be sought.

Wipe the Heat from the Surfaces.

In motors, to keep them cool, we arrange to wipe the heat off of the hot surfaces, and we use a liquid for the purpose, as water, or glycerine and water, etc. The specific heat of the liquid is brought into play and by keeping the liquid churned, or circulating, we bring cool splashes of the liquid up to replace the heat-laden portions fast enough to absorb all the heat and maintain a constant temperature. If we can wipe the heat off of the hot surfaces of the motor cylinder head, we can duplicate the process in connection with the brakes. We did not think it so easy without resorting to waterjackets, and most of us refuse to add to the freezing zones. Oil did not seem to lend itself to the process, since in the past the problem was to keep oil away from brakeshoe surfaces, but clutches submerged in oil do work. So will brakes. They will work in conjunction with cork inserts on a moderate pressure, or they will work anyway if the pressure is high enough to drive the oil out from between the faces and let the metals contact. It is best to avoid these high pressures if we can, and if cork is the product that will wipe the oil off of the faces—just as a rubber mop wipes water off of plate glass—and allow of friction contact, cork has a property that lends itself nobly to the task to be performed.

Coefficient of Friction of Cork.

The coefficient of friction of cork on oiled faces is higher than that of leather, as it is ordinarily found in cone clutches. It is high enough then to assure working qualities under pressure and low enough to abort structural impossibilities. The oil bath will serve to wipe away the heat and distribute it over the radiating surfaces of the housing. The one remaining factor is



Curve Showing How the Coefficient of Friction Changes, on a Given Road, as Speed Increases.

that of providing enough surface to dispel the heat. The emissivity of roughened black surfaces, as iron housings, for oil baths, with the car in motion, as will be the case with brakes on cars, may be set down as at the rate of 10 watts per square inch, within the allowable increase in temperature for the materials used. The surface then to radiate the heat must be sufficient to dissipate energy at a rate equal to snubbing a car on a grade, for some time, and taking the electrical equivalent of a horsepower, a means is at once afforded for fixing upon the requisite surface.

A Simple Concrete Application.

The simple process of stopping a car does not involve this problem, since the body of oil in the bath would have to be heated and that would have to be at the expense of time. In descending a grade the speed of a car would probably be low—say, ten miles per hour—and with the clutch free, thus putting it up to the brakes. Assuming that the friction of the car would total 30 per cent., weight would enter into the problem.

10 miles per hour = 880 feet per minute;
880/5 = 176 feet fall per minute;
= vertical drop per minute;
car weighs, say, 3,000 pounds, and a gradient of one in five;
3,000 × 176 = 528,000 foot pounds;

from which take 30 × 880 = 26,400; leaves 501,600 foot-pounds;

hence, $\frac{501,600}{33,000} = 15.2$ *H.P.*;

15.2 × .70 = 10.6 *H.P.* to be dissipated in heat over the surfaces;

and $\frac{10.6 \times 746}{10} = 791$ square inches of oil bath housing-surface required to dissipate the heat on a basis of 10 watts per square inch. This is not impossible.

This is on a basis of a draw-bar pull of 20 pounds per ton mile, which is a fair average figure, although some tests made some time ago showed 70 watts per 1,000 pounds—rate of expenditure—for a 3,000 pound car, would foot up to:

70 × 3 = 210 watts;
210 × 10 = 2,100;
2,100/746 = 2.8 *H.P.*;
2.8 × 33,000 = 92,400 foot-pounds per minute.

If the car—outside of the transmission losses—will retard on a bases of 92,400 pounds per minute, when doing 10 miles per hours, instead of 26,400 foot-pounds, then the surface of the drum housing will need be less. In this we have a factor of safety which may be allowed to stand.

Retarded by "Horizontal Component."

A car descending is retarded by the "horizontal component," and if the brakes are on the remote end of the transmission, by the "mechanical component."

The same car—motor cut off by the clutch—will be impelled by the "gravitational component." Since the brakes will be arbitrarily set to control the speed, the gravitational component will be equal to the energy of position residing in the car. In this case the car is said to drop—down grade $\frac{880 \text{ feet}}{5} = 176$ feet per minute. The energy of position is 176 × 3,000 = 528,000 foot-pounds, from which the two negative components must be taken, leaving the energy that must be absorbed and dissipated by the brakes, which was found to be 10.6 horsepower, reduced to watts for convenience.

The pressure on a brake drum—pull in pounds at the periphery—would be, for the case in point:

$$P = \frac{10.6 \times 33,000}{6.28 \times .5 \times 45^2} = 246 \text{ pounds};$$

and were the emergency brakes required to do the work, considering a four to one gear ratio, the pull on each one would be: 246 × 2 = 492 seconds, considering all brakes as of 12 inches in diameter. In the cases involving brake-drums of greater diameter, examples of which are now quite common, the situation becomes much more favorable, except that it must be remembered that the "take-up" will have to be more carefully regulated, for reasons which will be obvious.

An Emergency Condition Portrayed.

In this we see the greater need of brakes than would follow the previous condition in which the torque of the motor was taken as a guide, but a gradient of one to five is most ususual, and the double set of brakes would about correct the discrepancy, were all the brakes of equal competence. There is one other way to take care of this condition; that is, place the emergency brakes on the clutchshaft and gear down so that the clutchshaft would be rotating at a considerably higher speed than that due to a direct drive. The losses in transmission would also help out. At all events it is possible to maintain the first contention in which the 12-inch drum would have to sustain a peripheral pull of 122 pounds.

Ability Is Proportional.

But the ability is proportional to the pull on the periphery, and the life is proportional to the contact area in square inches for a given material and peripheral pull. If we allow that the projected area will equal the contact area, then for a drum of 12 inches in diameter, with shoes 2 inches wide, the projected area will be:

12 × 2 = 24 square inches.

If it is safe to work on a basis of 10 pounds per square inch,

24 × 10 = 240 pounds;

and since this pressure will be against the periphery, it will be resolved as a tangential effort and become the pull P in the formula

$$P = \frac{H.P. \times 33,000}{2\pi R S} = \text{pull in pounds};$$

when, R and S = radius in feet and speed in revolutions per minute, respectively. The next question is: Will some other pressure per square inch be better? We will endeavor to answer this by some further tests.

Illustrating the Point.

If we assume that bronze on steel will be the basis from which to judge of relative values, it will be necessary to fix upon the coefficient of friction of the basic products first. This, for several pressures at low speeds, will be as follows:

Pounds per square inch:

2	4	6	8	10
Coefficient of friction:				
.14	.14	.14	.14	.14

In other words, the coefficient is constant up to the point of seizing. After this point is reached the friction follows no law.

If, on the other hand, 20 per cent. of the bronze shoe surface is of cork—in the shape of inserts—using 3-4-inch corks in sockets 1 1-2 inches apart, center to center, the coefficient will be as follows:

Pounds per square inch:

2	4	6	8	10
Coefficient of friction:				
.35	.35	.35	.327	.293

In this we see the increase in value for decreasing pressure with a direct proportion below 6 pounds per square inch, and at about 5 pounds per square inch the coefficient is at its maximum.

On the other hand, oil will not squeeze out—excepting under the cork, where it is mopped off—at such low pressures, and if the pressure is applied to an extent that will cause the cork to recede to the flush, the oil film on the metal-to-metal contact will defeat the further increase in clutching ability, provided the metal surface is the remaining 80 per cent., allowing 20 per cent. for cork. The theoretically correct shoe, then, will present but little metal-to-metal surface and an easy oil channel.

LETTERS INTERESTING AND INSTRUCTIVE

DOUBLE TAXATION, STATE AND CITY.

Editor THE AUTOMOBILE:

[1,750.]—Will you be kind enough to advise me on the above subject, as follows: If, in addition to the tax paid by all automobile owners in their own State for license to use their machine on public highway, the town in which a man lives assesses his automobile as part of his personal property, similar to that of his home (and horses, etc.), is this not a case of double taxation; and is there not a reason to protest against it? No road tax is assessed on horse and wagon. J. F. B.

New York City.

You are not subjected to double taxation, for the following reasons:

First: The registration fee for your automobile which you pay to the Secretary of State is not a tax on property, but a license fee imposed to defray the expenses of the motor vehicle department in registering machines, issuing licenses and doing such other things as are required by law.

Second: Since the registration fee is not a tax on your automobile as property based upon value, it necessarily follows that, for the State as a municipality, to levy a tax on your automobile as property, is not taxing you twice for the same thing and in the same manner, or subjecting you to double taxation.

Third: Fees paid for registering an automobile, provided the fees are reasonable and are in amount no more than necessary to defray the expense of issuing the license and registering the machine, also maintaining the motor vehicle department, are properly imposed under the police powers of the State. By requiring the registration of machines, an identification system is established, for the detection of offenders against the law and the safety of the public.

Fourth: If the registration fees are unreasonable in amount, the excess is a tax upon either the automobile as property or the privilege of using it, in both of which cases the tax is illegal.

Fifth: Provided the registration fees are unreasonable, it is not double taxation for a municipality to assess a tax against an automobile upon which the unreasonable registration fee has been paid, because double taxation presupposes an existing legal tax.

These questions are now being litigated in New Jersey in a case testing the automobile law of that State. A decision is expected soon from the Supreme Court which will be of vast importance. It is claimed that the annual registration fees for automobiles in New Jersey are excessive and consequently illegal.

The fees required by the State of Connecticut for registering automobiles are not so high as required in the State of New Jersey, still they are larger than demanded in New York. In the latter State the fee is $2, and it need be paid but once. Whether the Connecticut fees are illegal because excessive, depends upon whether there is a material surplus left after deducting the motor vehicle department's expenses. It is merely a case of subtracting the expenses from the income. If there is a substantial balance, it is revenue, it is a tax, and it is illegal, because, since it is a tax, it is not imposed according to valuaton as required by constitutional provision.

OXYGEN AND NITROGEN IN AIR BY VOLUME.

Editor THE AUTOMOBILE:

[1,751.]—Will you please state the relation of nitrogen to oxygen in atmospheric air, under a pressure of one atmosphere, and at a temperature of 60 degrees Fahrenheit?

Jersey City, N. J. ALEXANDER.

(*a*) To find the quantity of nitrogen, by volume, in atmospheric air, corresponding to one volume of oxygen, procced as follows:

$$N = O \times 3.770992 \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (1)$$

(*b*) To find the quantity of oxygen, by volume, corresponding to one volume of nitrogen, proceed as follows:

$$O = N \times 0.265182 \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (2)$$

Volume changes with temperature: which must be considered.

QUITE AN UNDERTAKING, TO BE SURE.

Editor THE AUTOMOBILE:

[1,752.]—I am a subscriber to "The Automobile" and so I refer to you to answer the following questions:

I am making an induction coil and want to use 40 No. 16 double cotton-covered magneto wire for the secondary winding. I would like to know if you could tell me what size wire I could use for the primary winding, and what voltage to use for the best results. Could you give me any idea what diameter the flanges should be and what diameter core I should have. The coil will be 16 inches long.

San Rafael, Cal. F. W. ORPIN.

There is very little that you say which would enable one to aid you on a basis of much safety from the point of view of result of a character such as would take rank with good coils to be had on the open market. The leakage factor will be enormous if the core is as long as you suggest, and the diameter of the core should bear some relation to the length to compensate in some measure for the great length. On the other hand, if the diameter of the core is great, it is then that the length of the mean turn will be overmuch and the number of turns for a given resistance will be relatively few. No flange at all would suit the case, it is believed, for then it would be right to taper off the windings as they approach the ends of the core. The end windings probably will do but little good, anyway, and tapering down at the ends will enable the winder to accomplish the task with greater ease, unless it is that the winding is done on a machine. Probably the primary wire should be about 16 to 18 B. W. G. and the secondary winding should be between 36 and 38 B. W. G. for the secondary if the coil is to be used in automobile ignition work. On the other hand, it would be well to reduce the length of the core if the coil is to be used for automobile ignition service. As to the core, it is possible that one inch in diameter would do.

GEARS HAVE TO BE MESHED PROPERLY.

Editor THE AUTOMOBILE:

[1,753.]—Will you please tell me through "Letters Interesting and Instructive" how to time the half time gears properly on a double-opposed motor when the large wheel is in the lower part of the crankcase under the crankshaft? Also tell me if an engine will run at all if the gears are not properly meshed. How can I overcome the grinding or churning noise made by the water pump on this engine? Will grease do it? If so, what kind?

South Braintree, Mass. SUBSCRIBER.

The location of the half-time gear is merely incidental. The timing must be in accord with the fact that the valves must open and close in a way to perform the functions efficiently. If the gear is so placed as to render the mechanical work difficult it is then that more skill must be brought to bear on the task. In the meantime it is necessary to so mesh the gears that the valves will open and close relative to the piston travel in the manner as follows:

(a) Exhaust opens 3-8 inches of piston travel before center.
(b) Exhaust closes 1-16 inch of piston travel by center.
(c) Inlet opens 1-16 inch of piston travel by center.
(d) Inlet closes 1-4 inch of piston travel by center.
(e) Maximum spark advance, 33 degrees before center.
(f) Maximum spark retard, 7 degrees beyond center.

In the case (a) the exhaust opens before center on the power stroke; in the case (b) the exhaust closes by center on the suction stroke; in the case (c) the inlet opens coincident with the closing of the exhaust; in the case (d) the inlet closes by center on the compression stroke.

In relation to the timing as given, it is fair to say that in actual practice all sorts of deviations are made from the relations as given, and it is possible to argue in favor of them all. As a matter of fact, much depends upon the area of valves as it relates to the area of the cylinders and each specific case must be given attention on a basis, taking into account the details. Then it is a fact that the speed of the motor must be considered,

and since speed and compression must be taken into account simultaneously, it is evident that the problem can be multi-sided.

In a general way the timing as above set down will afford good results. The best way, perhaps, to mesh the gears for the right cam position is to shift the camshaft gear as it relates to its mate. The mechanical construction will have to be considered in this connection. A length of wire inserted into the priming cock of the cylinder head will serve as a depth gauge. The piston travel can be marked off with good accuracy in this way, and it is more definite than taking into account the angle of the timing as it may be marked off on the flywheel.

If the water pump grinds it is crying for grease, assuming the surfaces are not cut. The makers of grease for lubricating purposes will fill your order for the right quality upon request. If the pump is of the "gear" kind, and if the speed is high, it will make a little noise anyway.

OUTLINES OF A VERY SIMPLE CAR.

Editor THE AUTOMOBILE:

[1,754.]—As an interested reader of your journal, I would like to ask why a car outlined as below would not be a desirable car to build and own, by reason of its extreme simplicity.

First, use a three-cylinder two-cycle motor, cranks at 120 degrees, crankshaft offset, air-cooled by gear driven blower and cases around each cylinder, balance wheel at each end of crankshaft to aid in steady running; the same gear that drives the blower to drive the timer, and a force feed oiler to care for engine lubrication; all other parts oiled by local cups. Incorporate in rear flywheel a low tension magneto with coils on dash.

Second, use a friction transmission with differential on jackshaft and an enclosed silent chain running in oil both to each rear wheel; brake surfaces and sprockets integral on each rear wheel; all wheels and jackshaft, ball or roller bearings.

Third, control on left side; at least 32-inch wheels, and car of medium weight and power and speed; any type of body.

I am not an engineer and know nothing of the technical difficulties involved, but from a layman's point of view this car would have what would seem to be the simplest of all engines to build and care for and the simplest of transmissions. The engine would have the torque of a six-cylinder four-cycle engine, but all valves, springs, cams, rods, side shafts, pump, and connections, radiator and water are done away with in one stroke; also the extra moving parts for a separate magneto are saved.

I have seen it stated in the "Scientific American" (presumably unbiased) that a properly designed friction transmission was more efficient than an equally well designed sliding gear. Assuming them to be equal (I do not know that they are), with the friction transmission you eliminate from your car clutch, gearbox, sliding gears, universal joints, shaft, bevel gears, and the heavy and complicated divided rear axle, and substitute a transmission that is simple, light, cheap and fool-proof together with the strong, light, solid rear axle. Enclosed silent chain should be noiseless and should not stretch and ought to run easier than gears—at least it was my experience with many makes of bicycles that the chain-driven ones ran the easier. By reason of the steady pull of its engine and the innumerable speed combinations that friction transmission permits, this car ought to be very flexible. In view of the relatively few moving parts to make, the initial cost of the car should be low and yet enable a manufacturer to use the best of material and workmanship, its life should be long and its upkeep slight, and for the owner who must look after his own car there would seem to be the minimum of moving parts to watch in the machine outlined. It seems to me that every step taken in the direction of simplicity, so long as efficiency is not reduced, is a step in accordance with good sense and the tendency of the times.

I am an Elmore owner and a believer in the two-cycle principle, and also believe that when the two-cycle engine has reached the present perfection of the four-cycle, it will drive the latter from all but special fields. If you have your gas and spark a two-cycle engine can't help but go. Would the car I have outlined be practicable? Would it meet my expectations as to life, ease of operation, flexibility, low price, general every-day use and roadability.

Mineola, N. Y. "TWO-CYCLE."

It would be interesting to note the performance of a car such as you outline; Ford uses the magneto in the flywheel; one flywheel will do quite as well as two; the blower idea is now used; the dashboard might well be clean; two-cycle, air-cooling is used to some extent; friction drives seem to be good; left-hand drive is used on the Ford; it would be up to you to make good.

You say "medium weight, power and speed; the engine would have the torque of a six-cylinder, four-cycle motor." That is the question: would it?

Your plea for simplicity is to be commended; the two-cycle motor you name is water-cooled, and it is not with a friction drive. In mechanical work it seems that conclusions in the absence of an actual trial are worth but little; it follows that jumping at conclusions ofttimes leads to mechanical indigestion. It is suggested that you, in your desire for simplicity, reach conclusions which have not been proven by the facts thus far, and it will be inconsistent here to make the same mistake. If you have the time, skill, patience and money to pay the piper you might be able to make good.

CRUST ON SURFACES OF COMBUSTION CHAMBER.

Editor THE AUTOMOBILE:

[1,755.]—I have a couple of questions I should like to ask:

1. Do you know if the chemical carbon removers advertised will remove the carbon from the cylinders almost as well as scraping by hand, yet with absolutely no injury to the surrounding metal parts in the cylinder?

2. I wish to have the foot accelerator to the gas throttle to a two-cylinder 1906 touring car changed to a stationary gas throttle as in all the late cars, and also to keep the accelerator in addition if possible. Do you know what would be the cheapest, best and most feasible way for having this done?

3. In the same car, which has a rear axle of the pin and key style, we have continual trouble with the pins breaking, especially on one side, where on one-half of the side of the keyway in the hub, the keyway is sheared away, i.e., partially broken. Do you think if we only had a new hub put on it would remedy matters? Also, my garage man says that although the pin may be broken (not the key which runs horizontal to the axle) there is practically no danger of the wheel coming off, as part of the broken pin always sticks through where the hub and axle join. Is this true that with a broken pin there is practically no danger of the wheel coming off?

4. The head of the muffler on the same car is broken in. As it has been on the car for over two years, I presume there is more or less back pressure. Hence I think a new muffler is needed. Do you consider a new muffler is the best and cheapest to put on again, or would you advise some other kind of muffler, and why? Is there any back pressure exerted by the mufflers, and do you consider that they muffle the sound as well as possible?

Pawling, N. Y. RONALD R. KELSEY.

The chemical carbon remover would save you much work and some cost; it probably will do the removing quickly and well. You must take into account the fact that all the crust is not carbon, and it is not possible to guarantee that the time required to clean the cylinders will be the same in each case. With the cylinders once cleaned out, you will be able to keep them so by the systematic use of the decarbonizer. No complaints have ever been made such as will indicate that the decarbonizer will "etch" the cylinder walls.

You probably would save money by having the company furnish you with the necessary parts by means of which you would be enabled to bring about a reform of the carburetion.

The fact that the pin breaks is assurance to you that the key is not tightly fitted. It is dangerous to run a car when the rear wheels are threatening to come off, even if it is a fact that they do not come off very often. The one right way is to have the keys fitted "tight"—as tight as possible. The average man is not capable of doing the work. When the keys are driven home see to it that they are free from oil, and clean out the keyway as well. The new muffler of the same make as the car should serve for you. Some back-pressure is to be expected; not enough to cause you over-much annoyance.

NOISE IS DUE TO INACCURACIES.

Editor THE AUTOMOBILE:

[1,756.]—Despite the greatest care, I am unable to make gears for the transmission system so that noise will be reduced sufficiently for the demands; I know that some transmissions are quite noiseless, and I want to know how the feat is accomplished. In my judgment much of the noise is in the gears; why should it be there when I take the greatest care, use the best cutters the market affords, and cut the gears as accurately as possible?

New York City. FOREMAN.

In the first place, you "use the best cutters the market affords." This is a sure sign of failure because the market affords

cutters for gears in which the error is admitted, in that they are approximately correct, since they are designed for a range of teeth rather than for a fixed number of teeth. A cutter to be absolutely accurate must be designed for the exact number of teeth in the gear-wheel to be cut. While the error is not great and the makers of machines in general consider the results "good enough," the fact remains that the error makes for noise, in a transmission gear case, in which thin walls accentuate the noise, however little it may be.

If accurate cutters are provided and the teeth are cut accurately, which depends upon the accuracy of the "dividing-head," on the one hand, and the sharpness, speed and feed of the cutter, on the other, provided the temperature of the material on the gear is not altered in the process, the result will be good if it can be claimed that the gears will run on the pitch-line when they are in place; nor must the spindles be limber.

If the gears are hardened it is plain that something will have to be done to compensate for the "swelling" tendency, and if the centers are changed (which is the superior way) care must be exercised to avoid an excess. Then there is the question of the sliding gears. If they are loose on the sleeve, and they will have to be if the shaft is long or if the sleeve itself is long, especially if the shaft is small and if a "broached" (square) hole in the gear sleeve is depended upon for the purpose. If the shaft is of considerable diameter, so that it will not spring, and if (instead of a square) the shaft is spline with six shoulders, against which the pressure will come, it is possible to consider a close sliding fit (with a short sleeve) and then the gears will mesh on the pitch-line, or so close to it as to assure nearly noiseless performance, provided the pitch-line velocity is little more than 1,000 feet per minute as an outside figure.

With all these matters carefully attended to, the remaining questions will be by way of good "silent" ball or roller bearings, and a shell (case) so thick that it will not serve as a "sounding-board" unless to a slight extent, which fault can be leveled by the use of a hard mineral grease, which will serve for the triple purpose: (*a*) serve as a lubricant for the gears, (*b*) dampen the noise, the volume that will follow if all the above precautions are observed, (*c*) serve as a protection for the metal parts, as against rust and other etching media; barring the presence of acids, etc., in the lubricant itself.

CARBON DECREASES IMPACT ABILITY.

Editor THE AUTOMOBILE:

[1,757.]—While I feel confident of the fact that carbon in steel is at the expense of the ability of the same to sustain under conditions involving impact, the fact remains that steel manifests notable peculiarities which would stand some discussion. Why is the steel B N D, as given by Mr. Fay, of high impact ability and at the same time low in elongation (per cent. in two inches), carbon decreases the elongation, and here is a case in which steel is high in impact qualities, and low in elongation; what is the explanation?

Staten Island, New York. J. F. O'D.

The steel as referred to by you is low in carbon (about 20 points), and it seems that the impact ability is lowered by the presence of carbon, rather than as the direct result of a low elongation. This phenomenon has been noticed many times, and if the steel is low in carbon, from ores and scrap originally low in metalloids, reduced in an acid-hearth, the strength can be increased enormously, at the expense of the elongation, in the heat-treating process (aided by alloys), and the fact that the elongation may be low (relatively) will not be a sign that the impact ability is low.

ARCHIMEDES DISCOVERED THE PRINCIPLE.

Editor THE AUTOMOBILE:

[1,758.]—Will you go back to first principles and explain the action of a float in a carbureter?

Camden, N. J. JUST-PURCHASED-A-NEW-CAR.

The "Principle of Archimedes" is concisely stated as follows: "A body submerged in a liquid appears to lose a part of its own weight, the amount lost being equivalent to the weight of an equal bulk of the liquid."

If, then, the body weighs less than the weight of liquid it would displace were it of the same specific gravity as the liquid, the "buoyancy" of the body would be as the difference in weight. It is this buoyancy which is taken advantage of, in that the float submerges partially, and as the gasoline raises in the bowl the float is resisted, in that the valve mechanism retards the float and the valve is closed by the pressure due to the buoyancy of the float.

IT HAS THE LOOKS OF POLISHED BRASS.

Editor THE AUTOMOBILE:

[1,759.]—I would like to know why, in the development of the automobile, the flexible tube connecting the hand bulb with the horn, still persists in writhing its tortuous course along the outside of the car, collecting dirt, preventing proper washing of the body and supplying additional brass work to be constantly polished? Are there known objections to permanent internal piping, with simple outlets at the bulb and horn for attaching same?

Very truly yours,

New York. F. W. FERGUSON.

If the internal piping is properly done it will serve the purpose, and if the objections named go for dissatisfaction it is easy to eliminate the flexibile tube on the outside. So many like the appearance of the polished brass on the exterior that a ready sale is assured and, after all, the vendors of the commodity are governed wholly by the fact that good business results. Then, there is the fact that the device does work extremely well, and utility does lend enchantment.

NEW FAN FOR A FRANKLIN CAR.

Editor THE AUTOMOBILE:

[1,760.]—Can you give me a diagram and show what material will be needed to put a fan on a 1904 air-cooled, four-cylinder Franklin automobile? A great many owners have put them on, and as I have one I would like to do so. I do not wish to use a gear unless I have to.

New York City. FLUSHING.

It might be well to consult the maker of the car; just the information wanted will probably result.

MUST SET SPRINGS HIGHER THAN USUAL.

Editor THE AUTOMOBILE:

[1,761.]—I notice a correspondent has a runabout on which the springs are too stiff, except when he adds a rear seat with a 400-pound load. His problem, which is to make the car ride easy with and without extra load, is an old one. It can only be solved approximately. Supplementary coils, to make the springs ride easy with the light load, would probably make them too easy under the added weight. Lighter springs with "helper" plates, or "bumper" coils are used in delivery wagons, but seem hardly suitable to a pleasure vehicle.

In the nature of a compromise, I suggest the following: As the springs are now too strong for a single seat, they should be lightened so as to balance the car, say to a capacity of about 100 pounds per inch depression. This is what suits the average runabout. The extra weight of 400 pounds, if directly over the axle, would depress the springs two inches, therefore they must be set that much higher than usual. Thus we shall have springs easy enough for the light load, while the additional strength for 400 pounds of extra load will be gained from the two inches of further depression.

This, of course, will make the car stand high behind under the light load, or low under the heavy load, or a little of both. This is the case with his present springs though in a lesser degree.

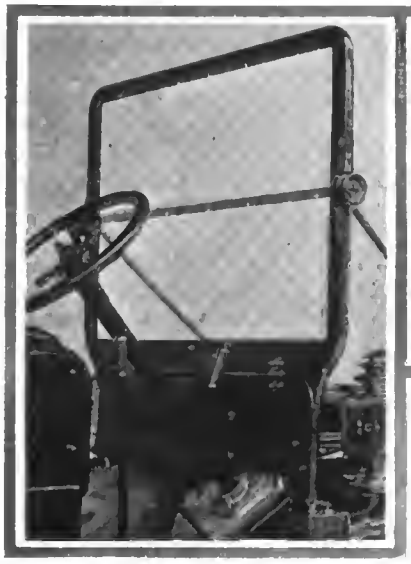
Chicago. WM. H. TUTHILL.

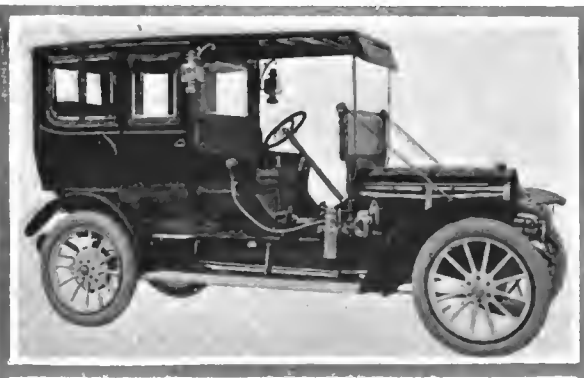
OVERLAND CYLINDER MEASUREMENTS.

Editor THE AUTOMOBILE:

[1,762.]—In your February 4 issue, under "Discrepancy in Horsepower Ratings," No. 1,730, in comparing motor sizes the stroke of the Overland motor is given as four inches. Again in the New York show issue of THE AUTOMOBILE and the same issue of "Motor Age," of Chicago, the stroke of the Overland is given in the list of specifications as four inches. As an owner of an Overland "30" to which the above refers, I beg to correct through your columns this misstatement, as the size of these cylinders is 4x4½, bore and stroke. I think your subscriber will find that most four-cylinder motors of this size on the market are rated at 30 horsepower, at a given engine speed.

Ashland, Ohio. C. A. HOFFMAN.





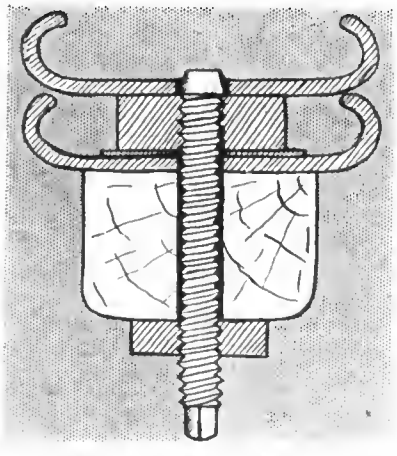
RAMBLER MAKES ITS WINDSHIELD.

In order that the windshield, which has become such a universal equipment on automobiles, shall harmonize with the general finish of the car, Thos. B. Jeffery & Company have decided to make their own shields for Rambler cars. The illustrations show the shield fitted to the new Rambler limousine with the upper half in three different positions. The shield is of heavy plate glass, with mahogany frame bound with brass, both of which match the finish of the dashboard. Stiff brass rods extending from the middle of the shield to the front of the bonnet insure that the frame will be stiff enough to practically eliminate vibration. An individual feature of the shield is the ability to locate the upper movable section at any desired angle, two large hand-operated clamps holding the glass in place. The wind is prevented from getting through at the joint, when the shield is raised, by a brass fixture.

The limousine, which is the highest priced as well as the highest grade Rambler product, is shown in the central illustration. This is in the nature of a new departure for the company, being the first production of an enclosed body, but the fine wood-working facilities, together with the long experience on finely built and finished touring bodies, have simply paved the way for this culmination of the body builders' art.

REVOLUTIONARY IDEA IN SPARE WHEELS.

MARSHALL, MINN., Feb. 8.—The recent great and growing interest in quick detachable tires and later in spare wheels has stimulated inventors to work along these lines. One of the inventors who has an apparently meritorious idea is Dr. A. D. Hard, of this city. He has patents pending on a device for fastening independent rims to wheels. A series of bolts occupying the lug and valve holes of the ordinary clincher rim as used in practice, and felloe, held in position by two nuts, one of which is adjusted to the space between the rims. The illustration shows a cross-section of an independent clincher rim held upon a common clincher rim by this device. The bolts resist sidewise stress and prevent the independent rim creeping. No bolt heads or nuts project. By its use cushion or solid tires may be quickly and securely attached to clincher wheels, and the diameter of the wheel is kept the same. This preserves the speed ratio, does not derange the speedometer, and permits of return to pneumatic tires at will. By carrying a cushion tire on an independent rim, the ready mounted tire can always be depended upon. Another use is to attach clincher rims to Fisk wheels. It only requires holes in the Fisk wheels to securely fasten clincher pneumatics. Another use is to secure to the clincher wheels tires which are larger in diameter than the former tires. Thus, it enables higher speed, or gives heavier tires, which wear longer. It is a very simple device, consisting for a common-sized twelve-spoke wheel of six bolts and twelve nuts.



Cross Section Hard Spare Wheel.

HERE'S ANOTHER WONDERFUL INVENTION.

GRAND RAPIDS, MICH., Feb. 8.—A recent invention of a local genius is of interest to automobilists, because it is applicable to electric searchlight, side light, and other lights. When so used it will require no wires, no attention, and cost nothing to operate.

Philip Young, an electrical engineer of this city, has discovered a method of supplying power to electric lights and motors without the use of wiring. His first experiments, which covered a period of two years, have been in the production of light. In this he has been successful, and lately has also produced current for a one-half horsepower motor.

The new lamp does not contain a storage battery, nor a dynamo, but generates its own electricity. The construction is amazingly simple. The base is a small cone-shaped contrivance, to which is screwed a regulation incandescent lamp. The electricity is generated inside the cone, which is only four inches high and an inch and a half in diameter. Inside this cone is a magnet cylinder which is covered on the outside much like an armature, and within which is a hard, white composition, the secret of the invention. It resembles carbon, only it is white instead of black. This composition in contact with the magnet creates the heat and produces light. It has a voltage of 110. The product will be placed on the market very soon by J. W. York & Son, manufacturers of band instruments.

The inventor has had one of the lamps in his home burning constantly since November 24. The members of the family say they use it as they would a lantern. It burns in any position. It is estimated that the lamp will burn for nearly a year.

It is the intention of the inventor to adapt it not only to ordinary electric lighting, but to automobile and other headlights, and to the running of motors.

The Imperial Automobile Club and the German Society of Motor Manufacturers and Traders have resolved to hold a combined motor boat and aeronautic exhibition in Berlin next year from March 1 to April 10. The industry will back up the promoters to the fullest extent and the primary arrangements have already commenced.

NEW YORK CITY CARNIVAL WEEK PLANS ARE MADE

ANOTHER week of festivities in automobile trade circles in New York City, made an annual affair after the phenomenal success attending the first one last year, is now being arranged by the automobile carnival committee of the New York Automobile Trade Association, which held its first meeting recently to outline plans. It was decided that the week from April 5 to 10 should be the one set aside for the celebration—one which will contain more elaborate and extensive features than the initial attempt and be concluded by a day instead of a night parade. The enthusiasm shown at the meeting presages success for the carnival, and the support of the whole trade is promised.

The affair last year was one of the most enlivening events in trade circles ever conducted, thousands of persons taking part, and hundreds of thousands coming from neighboring cities and towns to see the parades, decorations, cars themselves and contests. The crowds on the streets and the general spirit exhibited all over the city were evidences of the importance of the events, but it has been felt that many more would have taken part in the big parade of decorated cars if it were held at day. As it was, the length of the parade was exceedingly great, and some of the features of illumination were made possible by the darkness, but from present indications the greater preference for daylight affairs will offset this.

Another meeting of the committee will be held at an early date, when more of the details will be considered and further plans mapped out.

HERRESHOFF MAKES ITS METROPOLITAN DEBUT

THAT New York City awaited with interest the arrival of an entirely new production was well shown this week upon the appearance from Detroit of the first of the new Herreshoff touring cars, now being exhibited by Harry S. Houpt in the Rhinelander Building. A car which follows well-recognized lines of construction, with improvements claimed by the designer and makers, in both chassis and body, was what was seen by the many enthusiasts who have been following the progress of the car through the manufacturing stages as told by the pen of Advertising Manager West.

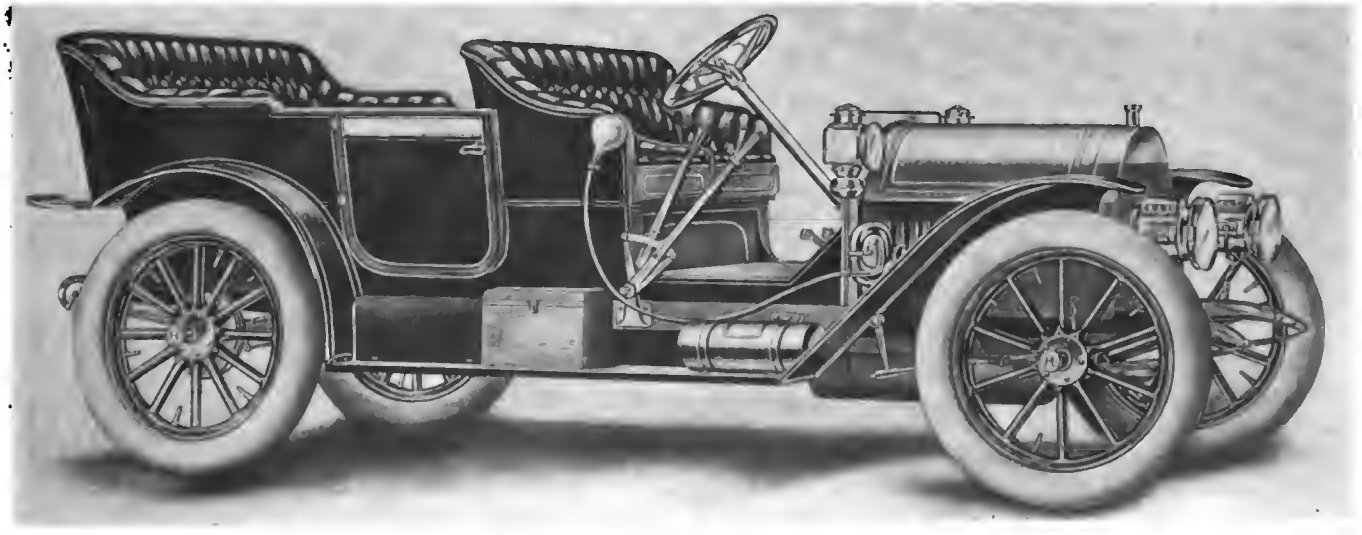
For many weeks the cars have been under way in the factory and tested on the roads so that it is expected from now on there will be a steady flow of the finished product to New York and other cities. For the moment however interest has centered in the advance guard, and the great number of people who have visited Mr. Houpt's new quarters have shown enthusiasm over it.

A four-cylinder motor rated at 24 horsepower, but which in brake tests is said to have developed 30, furnishes the power, with inlet and exhaust manifolds and a carbureter which were especially designed for it, and valve lifts, crankshaft and camshaft arrangements which show considerable ingenuity. The motor, clutch and three forward speed-selective sliding-gear transmission are an integral part. The power is transmitted by shaft to the live rear axle in a direct line, and with a gear ratio adapted to a maximum speed of from 45 to 50 miles per hour.

The car was designed primarily as a light machine of good class, suitable for owners of large, heavy cars in saving the latter from the wear and tear of use in cities, as well as for extended use by others in country touring and all-around work. Its light weight tends to lower tire expense and cost of operation, while at the same time ample power and effective springs make it suitable for use out of town and on any kind of roads. According to the statements of the designer, Charles Herreshoff, added efficiency at the rear wheels is obtained by a better corelating of the component parts than in many machines of size and selling price of this one.

By virtue of improved design the motor, which is built by the American and British Company at Bridgeport, Conn., greater potential ability has been secured from a given cylinder volume than usual, and careful attention to the same principles was followed in making the other parts of the car. The contracts made by the Herreshoff Motor Company, of Detroit, with the firms furnishing materials call for the same quality as are employed in the best American and foreign machines. Many of the manufacturing processes are carried on in the new factory.

In body equipment the car compares favorably with any of its size, giving ample seating capacity for five persons, the front seat being divided, and all upholstered in fine grain leather. Curved and enclosed fenders protect the passengers from flying mud and dirt. It is planned to produce about 1000 of these machines for the 1909 season, 200 of which are intended for New York City alone, while almost the entire output will be marketed in the East. The Middle, New England and Central States are included in this, and the West will not be taken up until 1910.



Herreshoff 24-H.P. Touring Car, with Straight-Line Shaft Drive and High-Duty Herreshoff Motor.

SILENT PERFORMANCE NOW NECESSARY.

Automobiles were once quite up to the scratch from the point of view of noise; all the kinds of noises possible in machines emanated from the bowels of some of the earlier types of cars. As it is at the present time, cars must perform noiselessly to be regarded as up to a fitting standard. In this connection it becomes necessary to define what will be regarded as noise relative to sounds which do not class as discordant. That motors will emit a little sound is to be expected, and that the sound can be so agreeable as not to be noticeable is well known. Such sounds are not as noise from the point of view taken, and while absolutely silent performance would be most agreeable, the fact remains that such performance is scarcely to be expected.

In the meantime it is assured that noise is wholly uncalled for, and many are the automobiles to be seen at every hand in which harmony is so entwined as to resolve all sounds into the class called agreeable. That modern transmission construction has a lot to do with this noiseless performance is assured, and the reasons lie in better material, more accurately proportioned parts, thicker walls, and micrometer fits; taking into account limits of tolerance, which automatically compensate for all the variations that follow in the footsteps of necessity—since it is true that no workman can be expected to arrive at the point—on the road called excellence, so very far that a one-inch plug will go into a one-inch hole.

Gears are now so well made that they will run on the pitch-line, despite the fact that they have to be heat-treated after they are machined; the teeth are so nicely fashioned that they "mesh" to a nicety, and the surfaces roll on each other almost to the entire exclusion of shock, jar, or rubbing. Bearings now do justice to the fine work which prevails throughout the rest of the system, and the spindles are short, of great rigidity, and of such fine material that "flexure" is reduced to the point below which its presence makes for noise. The end is that transmissions are efficient, and they will last for a long time; life and efficiency are as companions.

If healthy conditions can be regarded as present in a new car, it is the duty of the purchaser to make the residence in the car so inviting as to prolong the visit for the greatest possible length of time. Better yet, to make the conditions so happy as to render the home—if such it may be called—permanent. It is a simple process; noise, and what it entails, will never dispossess silent performance in a car that is well oiled, and in which the "silt" of the road is not invited, even for a temporary sojourn.

* * *

COMMERCIALS WORK IN BAD WEATHER.

A little slippery weather, of which the past two weeks have afforded a few striking examples, serves well to emphasize the advantages of the commercial power wagon over the horse in respect to tractive effort and reliability. A common sight, when the streets are icy, is a horse slipping, slipping, all over the pavement unable to get a secure footing. Almost as common is the sight of a crowd collected in the middle of the street around a wagon, denoting that a horse has fallen to the pavement. The power wagon, on the other hand, to which the streets all look alike, glides by the fallen horse with its perplexed driver and the advising crowd just as if there were no such thing as ice and snow. One can almost imagine the latter as it passed the horse saying with a snort, "competition, humph"! On these days, so common in a hard Winter, the effective radius of the horse is reduced to about ten miles; that is, that distance would constitute a day's work. On the other hand, there is no diminution of the truck's effective radius.

Then, in the matter of effectiveness, in the one case, the animal must be treated with extreme care; one might almost say "like a baby," else accident or death may result, meaning delay and a consequent heavy expense for a new horse. With the machine, however, no babying tactics are necessary; a day's work is the same, weather or no weather. The heavier loads carried and the great improvements in commercial vehicle tires have so increased the effective tractive effort as to make the vehicles practically independent of road conditions.
